EBELMEN, JACQUES-JOSEPH, French chemist, was born July 10, 1814, at Beaume-les-Dames, in France. Having passed successively through the colleges Henri IV. and Besançon, he in 1831 entered the École Polytechnique, and in 1833 passed from it to the École des Mines. His ability and attainments early attracted notice; in 1840 he was appointed assistant, and in 1845 chief professor of analysis at the École des Mines; in 1841 he was made one of the secretaries of the 'Annales des Mines,' and experimental chemist at the École Polytechnique. A wider field was however opened before him by the appointment in 1847 of director of the Manufacture-Royale of Sévres. To the duties of this office he applied all his energies. New and improved modes of operation, and the latest chemical discoveries, were employed with a view to economise the cost and improve the quality of the manufacture, while the most able designers and painters were called in for the purpose of obtaining the best models and the richest ornamentation; and under his direction the porcelain of Sévres acquired a reputation fully equal to that it had ever held, while the establishment was regarded as a model for the excellence of its arrangements. M. Ebelmen was a member of the commission sent by the French government to the Great Exhibition, London. In the beginning of March 1852 M. Ebelmen was named engineer-in-chief of the mines, but he survived the appointment only a few days, dying on the 31st of March, 1852, in his thirty-eighth year.

Ebelmen was regarded with great hope for his combination of sound and minute scientific knowledge with practical administrative ability, and extensive powers of generalisation; and his early death was generally regretted. He contributed a great many papers to the 'Annales des Mines,' the 'Annales de Physique et de Chimie,' and the 'Bulletin de l'Académie des Sciences.' Among the more important were some upon the composition of coal-gas, and its employment in metallic manufactures; and several upon the composition of rocks, the artificial reproduction of minerals, &c., of which we may mention—'Sur les Produits de la Décomposition des espèces Minérales de la famille des Silicates,' 1845; 'Sur une nouvelle Méthode pour obtenir des Combinaisons Cristallisées par la voie sèche, et sur ses applications à la reproduction des espèces Minérales,' 1847; 'Sur la Décomposition des Roches,' 1848, and particularly 'Sur les Altérations des Roches stratifiées sous l'influence des agents atmosphériques et des eaux d'infiltration,' 1851. The more important of his 'Mémoires' have been collected and published under the care of M. Salvétat with the title of 'Recueil des Travaux Scientifiques de M. Ebelmen,' 2 vols. 8vo, Paris, 1855.

(M. Chevreul, *Notice sur M. Ebelmen; Nouv. Biog. Générale.*)

ECHARD, LAWRENCE. It is unknown when this author was born; but his translation of the 'Amphytryon' of Plautus was published in 1694. He was educated at Cambridge, and having taken orders, was presented to a living in Lincolnshire. In 1712 he became

archdeacon of Stowe and prebendary of Lincoln. His historical works have long ceased to be read; but his translation of Terence is still frequently purchased by indolent schoolboys, who could not well buy a more unprofitable or worthless book. The characters of the elegant and refined Terence are made to utter all the vulgarisms and scurrilities of the 18th century, yet Echard has written a self-complacent preface, wherein he says that he could not have followed his author more closely without destroying his design "of giving an easy comic style."

ECKHEL, JOSEPH HILARY, an eminent antiquary and numismatist, was born at Entzersfeld, in Austria, January 13, 1737. His father, who was in the service of Count Zinzendorf, sent him at a very early age to the Jesuits' College at Vienna, where, in 1751, he was enrolled in their society. He studied philosophy, mathematics, divinity, and the learned languages, but devoted himself chiefly to antiquities and medals. His skill in the latter induced the superiors of the college, a few years afterwards, to give him the place of keeper of their cabinet of medals and coins. In 1772 he went to Italy, where the grand-duke of Tuscany, Leopold II., engaged him to arrange his collection; and on his return to Vienna, in 1774, he was appointed director of the Imperial Cabinet of Medals, and professor of antiquities. In 1775 he published his first work upon his favourite study, entitled 'Numi veteres Anecdota ex Museis Cæsareo Vindobonensi, Florentino Magni Ducis Etruriæ, Granelliano nunc Cæsareo, Vitsaino, Festeticiano, Savorgnano Veneto, alisque,' 4to, Vienna. This was followed in 1776 by 'Catalogus Musei Cæsarei Vindobonensis Numorum Veterum, distributus in partes ii. quarum prior Monetam Urbium, Populorum, Regum, altera Romanorum complectitur,' 2 tom. folio, accompanied by eight plates of unedited coins. In 1786 he published his 'Sylogæ I. numorum anecdotorum Thesauri Cæsarei,' 4to; his 'Descriptio Numorum Antiochiæ Syriæ, sive Specimen Artis criticæ Numariæ,' 4to, was likewise printed at Vienna the same year; and in 1787 he produced a small elementary work on coins for the use of schools, in his native language, entitled 'Kurzgefasste Anfangsgründe zur alten Numismatik,' 8vo, Vien. This work has since been improved and published in France, under the title of 'Traité Élémentaire de Numismatique Grecque et Romaine, composé d'après celui d'Eckhel,' par Gerard Jacob, 2 tom. 8vo, Par., 1825. In 1788 Eckhel published a folio volume upon the gems of the Imperial Collection, 'Choix de Pierres gravées du Cabinet Imperial des Antiques, représentées en xl. Planches;' and in 1793 the first volume of his 'Doctrina Numorum Veterum,' Vienna, 4to; the eighth and last volume of which was published in 1798. A supplement to it, with his portrait prefixed, afterwards appeared, 'Addenda ad Eckhelii Doctrinam Numorum Veterum ex ejusdem Autographo postumo,' 4to, Vindob., 1826. This work, which embraces the science of numismatics in general, has placed Eckhel at the head of writers upon ancient coins. He died May 16th, 1798, at the house of his friend the Baron de Locella.

In his younger years Eckhel published three or four small pieces unconnected with numismatics: namely, two Latin odes on the nuptials of Joseph II., in 1765; another in German, in 1768, on the departure of Maria Carolina, archduchess of Austria, from Vienna; and two years afterwards an oration in German on the occasion of the emperor's visit to Italy, 'Rede auf die Reise Josephs II. in Italien,' 8vo, Wien., 1770. An 'Explication Grammaticale des Prophéties d'Haggée,' by him, appeared in Millin's *Magasin Encyclopédique*, II^e année, tom. ii., p. 461.

(Saxii, *Onomasticom*; Visconti's account of Eckhel, in the *Biographie Universelle*; and the *Notitia Literaria de Vita et Scriptis J. H. Eckhel*, translated from the French of Millin, prefixed to the *Addenda ad Doctrinam Numorum Veterum*.)

EDELINCK, GERARD, a distinguished engraver, and likewise painter, was born in 1649, at Antwerp, where he acquired the rudiments of his art; but it was in France that his talents were fully developed; and the favours bestowed on him by Louis XIV. induced him to fix his abode in that country. Among his engravings the following are especially worthy of notice: 'the Holy Family,' after Raffaele; 'Alexander in the Tent of Darius,' after Lebrun; 'the Combat of Cavalry,' after Leonardo da Vinci; and, above all, 'the Crucifixion,' after Lebrun. In his larger plates of historical subjects, we too often have reason to lament the work selected; many pictures owe all their celebrity to his master-hand. Edelinck was no less happy in his portraits than in his historical engravings; he has left a great number of portraits of the most distinguished characters of his age. Several of them are in the collection of eminent men by Perrault. A remarkably pure and brilliant burin, a bold manner, correct drawing, fidelity to nature, and inimitable harmony of execution, place the works of Edelinck in the highest rank among those of his nation. He was engraver to the king, and member of the Royal Academy of Painting, and died at Paris in 1707. Neither his brother John, born 1630, nor his son Nicholas, born at Paris, 1680, equalled him in his art.

EDGAR, surnamed the Peaceable, was the second and youngest son of King Edmund I. by his wife Elgiva, or Algiva. He appears to have been born in 943, and consequently was only about three years old at his father's death, in 946. His brother Edwy, or Eadwy, may have been a year or perhaps two years older. In these circumstances, Edmund's brother Edred was unanimously chosen to succeed him by the Witenagemote. On the death of Edred however in 956, Edwy

was placed on the throne; and at the same time his brother Edgar was appointed governor or sub-regulus of Mercia, which was still considered as a distinct though subject kingdom. When, about two years after his accession, the enmity between Edwy and the church interest broke out into an open quarrel, the people of Mercia and Northumbria, instigated to revolt by Archbishop Odo, or at least timing their movement very opportunely for the purposes of the clerical party, placed Edgar at their head and proclaimed him king. It was finally arranged that Edwy should retain the sovereignty of the territory to the south of the Thames, and that all the rest of the kingdom should be made over to Edgar. The death of Edwy, however, about a year after, made Edgar king of all England in 959.

Dunstan, who had been banished by Edwy, had been recalled by Edgar, and made his chief counsellor, as soon as he found himself established as king of the country to the north of the Thames. Being as yet only in his sixteenth year (or perhaps not quite so old) when he became full king, he was of course entirely in the hands of the monks and clergy, whose instrument he had hitherto been. Dunstan, already Bishop both of Worcester and London, was now promoted to the primacy, as well as restored to his abbey of Glastonbury, and became the chief director of affairs both in church and state. The government of the kingdom by Edgar, under the guidance of this ecclesiastic (or rather under the direction of this ecclesiastic, for Edgar was evidently a mere instrument in the hands of Dunstan) was unquestionably conducted with a certain amount of ability and success. Throughout the whole reign England remained undisturbed by war; the northern pirates, who had harassed the country so incessantly for 150 years before, and who, twenty years after the death of Edgar, renewed their attacks, and did not desist until they had effected its conquest, during his life did not once attack the English coasts. According to the monkish writers, they were deterred from doing so by the powerful naval force that was kept up by the king. These writers make the fleet of Edgar to have consisted of 3600 ships. "The number," says a modern historian, in a somewhat decisive style of narration, "appears to me enormous; I have therefore retrenched a cipher." (Lingard, 'Hist. Engl.') In this fleet, which was divided into three squadrons, Edgar is said by Malmesbury to have every Easter circumnavigated the island in person; but this looks very like merely one of the improbable inventions by which Edgar's monkish admirers have laboured to magnify his name, and, in fact, the entire story wears a somewhat apocryphal aspect. It may be doubted whether we ought not to regard in the same light what some of the chroniclers tell us about his making annually a progress through the different provinces of his kingdom for the administration of justice. Another work of great public benefit which is attributed to him is the reformation of the coinage. He is also said to have freed Wales from wolves by commuting the money tribute imposed upon the Welsh by his predecessors for a tribute of 300 heads of these animals annually; by which means the wolves were extirpated in four years. But there were wolves in England long after this. Edgar has been chiefly lauded by the monkish annalists for his restoration of the church both to its ancient possessions and to a more perfect state of discipline than it had probably ever before known. And this is no doubt the true explanation of the extravagant eulogies which the monkish writers lavish upon Edgar, who was plainly a weak, selfish, and luxurious prince—that he raised, or permitted to be raised, the ecclesiastical power to a higher point than it had yet attained in England, and placed the supreme secular authority in the hands of a priest who ruled the country with a despotic sway, to which the people were compelled to yield a sullen obedience. The reign of Edgar was a peaceful and apparently a powerful one; but under priestly domination and Danish favouritism, the Anglo-Saxon spirit was broken, and the country was left, when the strong hand of Dunstan was removed, to fall a helpless prey to intestine turbulence and the assault of the foreigner. Under the vigorous administration of Dunstan and his subservient associates Ethelwold and Oswald, the bishops of Winchester and Worcester, the married clergy were removed almost to a man from the cathedrals and abbeys; and no fewer than fifty-four monasteries were founded or restored in different parts of the kingdom, and filled with monks as well as richly endowed. They were all subjected to the Benedictine rule.

The laws of Edgar that have been preserved consist partly of some enactments touching the payment of the tithes and other church-dues, and partly of a few civil regulations chiefly relating to the improvement of the police of the kingdom and the better administration of justice. One is directed against the crime of malicious defamation, and enacts that if the falsehood of the evil report can be proved, the defamer should either have his tongue cut out (that was no doubt thought a peculiarly appropriate punishment), or should redeem it with the value of his head, that is to say, should pay the sum at which his life was valued according to the class of society in which he was ranked. Another directs that the Winchester measure should be the standard for the kingdom. These laws however were only enforced in the Saxon provinces of Edgar's dominions. To his Danish subjects, who occupied nearly or fully half the kingdom, he appears to have only recommended the adoption of some of the English laws. The majority of these Danes resident in England were still pagans, and were governed by earls of their own nation, though they acknowledged the supremacy

of the Saxon king; and it was not till towards the close of the reign of the Confessor that the authority of the English law was fully extended over the part of the country which they occupied. Edgar however had spent his earliest years among the Danes, and it was by their aid chiefly that he had acquired his first throne; he consequently was attached to them, and during his reign their preponderance was studiously maintained—a circumstance which perhaps more than the king's 3600 ships served to preserve the country from Danish invasion.

The monkish chroniclers give the loftiest descriptions of the power and extensive authority of Edgar, telling us that he was acknowledged as their supreme lord by all the other kings of Britain and the surrounding islands. The story told in the Saxon chronicle and elsewhere of his having been rowed in his barge on the Dee by the eight subject kings of Scotland, Cumberland, Anglesey with the Isle of Man and the Hebrides, Westmorland, Galloway, North, South, and Middle Wales, is well known. It is also affirmed that the greater part of Ireland had submitted to his authority. The dominion which he arrogated to himself appears in fact not to have been inferior to what we find claimed for him by his panegyrists. Among the titles assumed by him on his seals and in charters are—'Edgarus Anglorum Basileus, omniumque regum insularum oceanique Britanniarum circumiacent, cunctarumque nationum que infra eam includuntur, Imperator et Dominus'—'Rex et Primicerius totius Albionis'—'Basileus dilectæ insulæ Albionis, subditis nobis sceptris Scottorum, Cumbriorumque, atque Brittonum, et omnium circumiectis regionum,' &c. These "pompous and boastful titles," observes Mr. Turner, "sometimes run to the length of fifteen or eighteen lines." Much difficulty in believing that this assumption of power had any real foundation is occasioned by the absence of any record or notice of the subjugation of the more important of these neighbouring kingdoms by any of the Anglo-Saxon monarchs. What event ever happened, for instance, that could possibly have induced the king of Scotland to acknowledge himself in this manner as the vassal of the king of England? The pacific character claimed for the reign of Edgar, who is said never to have had occasion to draw the sword against an enemy, makes it still more difficult to understand how he should thus have compelled all his neighbours to do him homage, and take him for their lord and master.

The monkish writers, with whom Edgar is such a favourite, have not altogether concealed the fact that he was no saint in his morals. The story appears to be sufficiently authenticated which attributes to him the violation of a lady of noble birth, and that too while she was resident in a convent. He was twice married, first to Elfeda the Fair, by whom he had a son, Edward, who succeeded him; and, secondly, to Elfrida, the daughter of Ordgar, earl of Devonshire, who bore him Edmund, who died in his infancy, and Ethelred, for whom his infamous mother opened a way to the throne by the murder of Edward. The circumstances of the marriage of Edgar and Elfrida—the commission given by the king to Ethelwold to visit the lady and ascertain the truth of the reports of her beauty—the treachery of Ethelwold, who represented her to his royal master as unworthy of her fame, and then married her himself—the discovery by her and Edgar of the deceit that had been practised on both of them—and the subsequent assassination by the king of his unfaithful emissary—are related by Malmesbury on the faith of an ancient ballad. There is nothing in the character either of Elfrida or Edgar that need occasion us any difficulty in believing the story.

Edgar was not solemnly crowned till the fourteenth year after he succeeded to the throne. This has been accounted for by stating that Dunstan imposed on Edgar a severe penance of seven years duration for the abduction of the nun Wulfreda, with the additional penalty that during that period Edgar should not wear the crown: but this would not account for the ceremony being deferred for fourteen years. The ceremony was at length performed at Akemanceastre, that is, Bath, on the 11th of May 973. He lived only two years longer, dying in 975, when he was succeeded by his eldest son Edward, afterwards designated the Martyr.

EDGAR ATHELING, that is, Edgar of the blood royal, or Prince Edgar, as we should now say. The personage commonly understood in English history by this title is Edgar, the grandson of King Edmund Ironside through his son Edward, surnamed the Outlaw. Edward and his brother had been sent from England by Canute in 1017, the year after his accession, to his half-brother Olave, king of Sweden, by whom it was probably intended that they should be made away with; but Olave spared the lives of the children, and had them removed to the court of the king of Hungary. All the English historians make the Hungarian king by whom they were received to be Solomon; but this must be a mistake, for that king did not ascend the throne till 1002, and was only born in 1051. The king of Hungary at the time when the children of Edmund Ironside were sent to that country was Stephen I., who reigned from 1001 to 1038. The story, as commonly related, goes on to state that one of the brothers, Edmund (or, as some call him, Edwin), married a daughter of the Hungarian king, but died without issue; and that the other, Edward, married Agatha, the daughter of the Emperor Henry II. and the sister of Queen Sophia, the wife of Solomon. Here again there must be some great mistake, for the Emperor Henry II. never had any children. Who Agatha really was, therefore, it is impossible to say. She bore to her husband, besides Edgar, two daughters, Margaret and Christina.

Edgar, as well as his sisters, must have been born in Hungary; but the year of his birth has not, we believe, been recorded. His father, after an exile of forty years, was sent for to England, in 1057, by his uncle King Edward the Confessor, who professed an intention of acknowledging him as next heir to the crown: the Outlaw accordingly came to this country with his wife and children, but he was never admitted to his uncle's presence, and he died shortly after, not without the suspicion of foul play, which one hypothesis attributes to Earl Harold, another to the Duke of Normandy. There is nothing like proof, however, of the guilt of either. The event in the meantime was generally considered as placing young Edgar in the position of his father as heir to the crown; and it seems to have been now that the title of Atheling (which had been borne by his father) was assumed by or conferred upon him. He was at any rate the Confessor's nearest relation; and if Edmund Ironside, from whom he sprung, was illegitimate, as some have supposed, the circumstance of his having worn the crown seems to have been regarded as sufficient to wipe away the stain, and to bring his descendants into the regular line of the succession. All Edmund's brothers and half-brothers, with the exception of the reigning king, had perished, most of them having been cut off by Canute and the other kings of the Danish stock; and the Confessor himself and his grandnephew, young Edgar, were now the only remaining male descendants of Ethelred II.

Edgar was still in England when the Confessor died in January 1066; but he was yet very young, and appeared to be feeble in mind as well as in body, and therefore was in nowise fitted either to take a part, or to be used as an instrument by others, in the first tumult of the contest in which two such energetic spirits as Harold and the Norman William now proceeded to try their strength. Insignificant as he was however from his personal endowments, the Atheling derived an importance from his descent and his position which afterwards occasioned him to be conspicuously brought forward on various occasions, and has made him an historic character. On the destruction of the power of Harold at the battle of Hastings, he was actually proclaimed as king by the citizens of London; but on the approach of the Conqueror, he was one of the first to go to him at Berkhamstead and to offer full submission. He then took up his residence at the court of William, who allowed him to retain the earldom of Oxford, which had been bestowed upon him by Harold. When the Conqueror the following year visited his Norman dominions, we find him taking the Atheling in his train. In 1068 however Edgar appears to have fallen into the hands of the discontented Northumbrian lords Maerleswene (or Marleswine), Cospatic, and others, who, deserting the Norman conqueror, carried the heir of the Saxon line and his mother and sisters with them to the court of the Scottish king Malcolm Canmore. This movement was attended with important consequences. Malcolm soon after married Edgar's eldest sister Margaret, and of this marriage came Matilda, whose union in 1100 with Henry I. of England was the first step towards the reconciliation of the Saxon and Norman races. Meanwhile Edgar and his friends were followed to Scotland by many other Saxon fugitives, who were the means of introducing into that country much of the superior civilisation of the southern part of the island. A connection between Scotland and Hungary appears also to have arisen out of this flight of Edgar, and the subsequent marriage of his sister with the Scottish king.

It was not intended however by Cospatic and his associates that Scotland should serve them merely as a place of refuge. A powerful confederacy was immediately formed against the English king, in which they and their protégé Edgar were associated with the men of Northumberland and Sweyn Estriden the king of Denmark. The united forces of these several powers stormed the castle of York on the 22nd of October 1069, and put the Norman garrison to the sword; on which, according to some authorities, Edgar Atheling was a second time actually proclaimed king. But the approach of William soon compelled him to fly for his life, and he again took refuge in Scotland. Here he appears to have remained inactive till the year 1073, when he was again induced to engage in a scheme for annoying the English king at the instigation of Philip king of France, who invited him to come to that country, promising to give him some place of strength from which he might attack either England or Normandy. Edgar on this set out with a few ships; but he was wrecked in a storm on the coast of Northumberland, from which he with difficulty made his escape for the third time to Scotland, in a state of almost complete destitution. He was now advised by his brother-in-law Malcolm to make his peace with William; and that king having received his overtures favourably, he proceeded to England, where William gave him an apartment in his palace, and a daily allowance of a pound of silver for his support. In this state of dependence he remained for some years; but at length he seems to have gone over to Normandy, where, after the death of the Conqueror, his son Duke Robert made the Saxon prince a grant of some lands. The grant however for some reason which does not appear, was soon resumed, and the Atheling was compelled, for the fourth time, to betake himself to Scotland in 1091. In the end of the same year it is related that a peace was effected by the good offices of Edgar and Duke Robert between Malcolm and William Rufus, when their armies had met and were ready to engage, in Lothene or Loidis (that is, most probably, the part of Scotland now called Lothian, then considered as

a part of England). On this occasion Edgar was reconciled to the English king, and he again took up his abode at the court of William. In January 1092 however Duke Robert and he suddenly withdrew together to Normandy; and not long after Malcolm and William were again at war. The Scottish king fell in a conflict with an English force commanded by Robert de Moubay near Alnwick on the 13th of November 1093; his eldest son Edward was slain with him; and his queen, the sister of Edgar Atheling, died three days after, having only survived to learn the loss of her husband and her son. Immediately after this we read of Edgar securing the children of his deceased brother-in-law and sister from the attempts of their uncle, Donald Bane, who had usurped the Scottish throne, and conveying them to a place of safety in England, a circumstance that would apparently imply that he had himself returned to that country from Normandy, and once more secured the protection of the English king. Here he seems to have continued during the remainder of the reign of Rufus. In 1097 he is recorded to have raised, with the approbation and aid of that king, a body of troops, and marched with them into Scotland, where he drove Donald Bane from the throne, and placed on it his nephew Edgar, the son of Malcolm. One account makes him to have immediately after this joined his old friend Robert duke of Normandy in the Holy Land, with a force of 20,000 men, collected from all parts of England and Scotland; but this part of his story is neither well supported nor very probable in itself. It is certain however that on the breaking out of the war between Henry I. and his brother Robert, a few years after the accession of the former to the English throne, Edgar was found on the side of Robert, although the recent marriage of his sister to Henry might be supposed to have attached him to the interests of that prince. He was one of the prisoners taken by Henry at the decisive battle of Tinchebrai on the 27th of September 1106, in which Robert finally lost his dukedom and his liberty. The victor however treated the Saxon prince with more lenity or contempt than he showed in his treatment of his own brother. Soon after being brought to England, Edgar was restored to liberty; and some accounts state that he subsequently visited Palestine. But the remainder of his history is very obscure. Malmsbury only informs us, without specifying any date of his decease, that he died in England after having lived to a good old age, without ever having been married or having had any issue, leaving behind him the character of a weak but inoffensive and well-intentioned man. He has certainly the distinction of being about the most insipid hero of anything like romance on record, and the narrative of his life may be quoted as a curious instance of the interest that will be sometimes awakened by the position and fortunes of an individual however personally insignificant.

EDGEWORTH, RICHARD LOVELL, an ingenious mechanical philosopher, but better known as the father and literary associate of Maria Edgeworth, was born at Bath, in 1744. He was descended from an English family, which had settled in Ireland in the reign of Queen Elizabeth, and resided in Edgeworthstown, in the county of Longford, where his boyhood was chiefly spent. A hasty marriage, contracted at the age of nineteen, while he was an under-graduate of Corpus College, Oxford, cut short his studies at that university, and led him to return home; but in 1765, intending to be called to the bar, he came to England, and took a house at Hare Hatch, between Maidenhead and Reading. During his visits to London to keep his terms, he became acquainted with Sir Francis Delaval and other gay and sporting men of the day, concerning whom a number of anecdotes are preserved in Mr. Edgeworth's autobiography. In that society he was distinguished by a high flow of spirits, and an uncommon share of that activity and ingenuity which adapts itself to the lighter pursuits of social amusement as readily as to higher and more serious purposes. At home he was chiefly occupied in prosecuting a variety of ingenious mechanical contrivances, among which we may mention the first erection of a telegraph in England, originating in a bet relative to the speedy transmission of racing news from Newmarket to London. During this residence in Berkshire he became acquainted with the eccentric philanthropist Thomas Day, with whom he lived in the closest friendship. His mechanical pursuits introduced him to Dr. Darwin, and subsequently to Watt and Bolton, Wedgwood, and other eminent scientific men. In 1769, by his father's death, he came into possession of a handsome fortune, and gave up the intention of following the law as a profession.

Mr. Edgeworth returned to Ireland in 1782, "with the firm determination," he says, "to dedicate the remainder of his life to the improvement of his estate and the education of his children, and with the sincere hope of contributing to the amelioration of the inhabitants of the country from which he drew his subsistence." To this resolution, during the remaining thirty-five years of his life he steadfastly adhered; devoting his best powers to the useful performance of his duties as a magistrate, a landlord, and a father. He was an active and influential member of the Irish Volunteers, and continued, after their dissolution, and through life, a steady advocate of reform in parliament, he was a member of the last Irish house of commons, and spoke and voted in opposition to the Union. Retaining the ardent spirit of his youth, he engaged in a variety of projects for reclaiming bogs, establishing a system of telegraphic communication, experiments on the construction of carriages, moveable railroads, &c. In the

cultivation of his estate and in the management of his tenantry he was skilful, prudent, and humane. His judicious and discriminating kindness and his acknowledged impartiality as a magistrate (a rare quality then in Ireland) gained their sincere affection, inasmuch that in the insurrection of 1798, though he was absent and assisting with his corps of yeomanry in the defence of Longford, his house at Edgeworthstown was visited by the rebels, and yet was preserved uninjured and untouched. He died June 13, 1817, after an old age of unusual activity and power of enjoyment.

Mr. Edgeworth married four wives, by all of whom he had children. The number of his children, and their unusual difference in age, a difference amounting, between the eldest and youngest, to more than forty years, gave him peculiar opportunities of trying experiments in education, and watching their results. His family were brought up almost entirely at home, and with an unusual degree of parental care. The results of his experiments were made public in 1798, in a work which at the time attracted much attention—"Practical Education," a treatise written principally by Miss Edgeworth, but partly by himself; and based on his theory of education, his observation, and the experience of his own house.

Mr. Edgeworth was not a ready writer; and it may have been partly owing to this that he preferred engaging in a sort of literary partnership with his daughter to embarking alone in any work of length. 'Practical Education' and 'Irish Bulls' were avowedly written by them in common; and Miss E. in her father's 'Memoirs' (vol. ii., chap. xvi.) has recorded in warm terms of filial affection her obligations to him in her other works. It was his habit to revise and correct all her productions carefully, and to sanction their issue to the world by his paternal *imprimatur*; a form which the world thought might as well be omitted.

The following works are published in his name:—"Rational Primer;" "Poetry Explained;" "Readings in Poetry;" "Professional Education;" "Letter to Lord Charlemont on the Telegraph;" "Speeches in Parliament;" "Essay on the Construction of Roads and Carriages." He also published papers in the Philosophical Transactions, Nicholson's Journal, and the transactions of the Royal Irish Academy on various subjects, as the Telegraph, Resistance of the Air, Aerostation, Railroads, the Construction of Carriages, and the description of a handsome spire which he had caused to be erected inside the steeple of the parish church, and then lifted into its place.

(*Memoirs of R. L. Edgeworth, 1820.*)

EDGEWORTH, MARIA, the daughter of the preceding, by his first wife, was born on January 1, 1767, at Hare Hatch, near Reading, in Berkshire. In the year 1782 her father went with his family to reside on his paternal estate at Edgeworthstown, until when, except for a few months in her childhood, his daughter had never been in Ireland. From that time however Edgeworthstown became her abode for the remainder of her long life, with the exception of occasional visits of a few weeks only to England, Scotland, and France, and for about two years at Clifton in attendance on her sick step-mother. The neighbourhood of Edgeworthstown did not afford much congenial society, the family of the Earl of Longford at Pakenham Hall, that of the Earl of Granard at Castle Forbes, and that of a Mr. Brookes, being the only ones whom they visited; and Pakenham Hall, she says, was twelve miles distant, with "a vast Serbonian bog between us, with a bad road, an awkward ferry, and a country so frightful, and so overrun with yellow weeds, that it was aptly called by Mrs. Greville, 'the yellow dwarf's country.'"

Miss Edgeworth was principally educated by her father, as all his other children were. They all lived on the most confidential terms with him, and she was very early selected as his business assistant, copying letters, receiving rents, and welcoming his tenants, while his office of magistrate gave her still further opportunities of observing the manners and habits of the peasantry around her. These occupations soon led to her becoming a co-operator with her father in literary productions. The first was a series of 'Essays on Practical Education,' published in 1798; and 'Early Lessons,' which had been commenced by Mr. Edgeworth and his second wife, was continued by him and his daughter; the 'Parent's Assistant' was also a joint production, as was the 'Essay on Irish Bulls,' published in 1808. But Miss Edgeworth's fame rests upon her novels, which were produced without assistance, though they always had the benefit of her father's revision, while he was living. The series commenced with 'Castle Rackrent,' published in 1801, and closed in 1834 with 'Helen.' In the interval there appeared 'Moral Tales,' 'Belinda,' 'Leonora,' 'The Modern Griselda,' 'Popular Tales,' 'Tales of Fashionable Life,' 'Patronage,' 'Frank,' 'Harrington,' and 'Ormond,' with some minor tales. Her last production was 'Orlando,' a children's tale, published by the Messrs. Chambers in 1847.

The novels of Miss Edgeworth were published some years ago in a collected series. The manners which they describe, especially those of fashionable life, belong in some degree to a past generation. But her delineations of character, more particularly of Irish character, are so true to nature, and there is such a vein of quiet humour and practical good sense running through them all, that amidst the more exciting plots and strong situations of the novels of our own time, the more important may be referred to as worthy of a lasting place in our literature.

Miss Edgeworth passed a quiet but useful life with her family; she maintained an extensive correspondence with many friends and literary acquaintances, and at length died on May 21, 1849, at the venerable age of eighty-three.

EDMUND I., King of the Anglo-Saxons, was the son of King Edward the Elder, by his third wife Edgiva. According to the common statement, he was born in 923, or about two years before his father's death, but we are inclined to believe that his birth was some years earlier: he is said to have fought at the battle of Brunanburh in 934, when, if 923 be the correct date of his birth, he could have been only eleven years old; and was twice married, and by one of his wives had two children, yet his death took place in 946.

Edmund succeeded his half-brother Athelstane on the 27th of October 941. Immediately after his accession the Danish people of Northumbria rose in revolt under the same Anlaf or Olave who had been defeated by Athelstane in the great battle of Brunanburh, and forced to flee to Ireland. After the war had lasted about a year, an accommodation was brought about by the Archbishops Odo and Wolstan, by which it was arranged that all the territory to the north of Watling-street should be given up to Anlaf. The Danish earl however died the next year, and Edmund, by a prompt and vigorous use of the opportunity, was successful in recovering all that he had lost. In 945 he also succeeded in reducing the hitherto independent state of Cumbria (including the modies, Cumberland and Westmoreland), which, after cruelly putting out the eyes of the two sons of the king, Dunmail, he made over to Malcolm I. of Scotland, to be held by him as the vassal of the English crown. The reign of Edmund, who was distinguished not only for his personal courage, but by his taste for elegance and splendour, on which account he received the surname of the Magnificent, was terminated on the 26th of May 946, by a blow which he received from an outlaw named Liof, who had the audacity to present himself at the royal table as the king was celebrating the feast of St. Augustine at Pucklekirk, in Gloucestershire. Edmund, on his refusal to leave the room, rose himself to assist in expelling him, when the intruder, with a dagger which he had concealed under his clothes, stabbed him to the heart. King Edmund I. left by his wife Elgiva two sons, Edwy and Edgar, who eventually both sat on the throne; but as they were mere children at the time of their father's decease, they were set aside for the present, and his immediate successor was his brother Edred.

EDMUND II., King of the Anglo-Saxons, surnamed Ironside, either from his great strength, or the armour which he wore, was the son of King Ethelred II., and was born in 989. According to the account that has commonly been received, his mother was Elgiva, or Ethelgiva, the daughter of Earl Thored, or Toreth, who was Ethelred's first wife. Other authorities however assert that the mother of Edmund, and also of several of his brothers, was a foreign lady, who was only Ethelred's concubine. On the whole, the point of his legitimacy must be considered doubtful.

Edmund appears, in the history of the latter years of his father's calamitous reign, as the chief champion of the English cause against Canute and his Danes, who had by this time nearly overrun the kingdom. On the death of Ethelred in 1016, Edmund was proclaimed king by the burgesses of London, and soon after, at least all the kingdom of Wessex, the hereditary dominion of his family, and which was now considered as comprehending the whole territory to the south of the Thames, appears to have submitted to his authority. He had the year before, by a marriage with Elgiva, the widow of Sigefrith, a thane of Danish descent, who had been put to death by Ethelred, made himself master, in defiance of the despised and dying king, of estates of great extent; and the power he thus acquired is supposed to have materially assisted him in securing the throne.

The short reign of Edmund was nearly all spent in a continuation of the sanguinary struggle in which he had already so greatly distinguished himself. His exploits are dwelt upon by the old national chroniclers with fond amplification, but it is not very easy to separate what is of historical value in their narratives from the romantic decorations. Immediately on Edmund's accession the Danish forces appear to have besieged London. The English king remained in the capital till it was considered secure; after which we find him engaging Canute, first at Pen, in Dorsetshire (or, according to another account, near Gillingham, in Somersetshire); and then at a place called Sceaestan, which is supposed to be the spot still marked by a stone at the meeting of the four counties of Oxford, Gloucester, Worcester, and Warwick. In both these fights Edmund appears to have been victorious; that of Sceaestan lasted two days. A third engagement took place at Brentford, the issue of which is disputed. Soon after, the two armies met again at Ottenford, or Otford, in Kent, when the Danes were defeated with great slaughter. Finally however Edmund sustained a decisive discomfiture at the great battle of Assandun, supposed to be Assington, in Essex. After this, according to one account, which however has been generally discredited by modern historians, Canute and Edmund agreed to decide their quarrel by single combat, and the encounter accordingly took place on an inlet called Alney, or Olney, in the Severn, which some place near Deerhurst, others near Gloucester, between Overbridge and Mayesmore. The result was, that Canute was obliged to yield and sue for his life. Whether the single combat took place or not, it is certain that an arrangement between the

parties was now made, by which Mercia and Northumbria were made over to Canute, while Edmund was allowed to retain possession of the rest of the kingdom, with the nominal sovereignty of the whole. It is also said to have been stipulated that when either should die the other should be his successor. Edmund died a few weeks after this pacification, having worn the crown only about seven months; and although there is considerable variation and obscurity in the accounts of his death, there are strong reasons for believing that he was made away with by the contrivance of Canute. The northern historians state this in distinct terms. Canute immediately mounted the vacant throne, 1016. Edmund Ironside left by his wife Algitha two sons, Edward, called the Outlaw, and another, whom some call Edmund, others Edwin, and of whom it is not known whether he was older or younger than Edward. [EDGAR ATHELING.] Edwy, the brother of Edmund, was put to death by command of Canute.

EDRED, King of the Anglo-Saxons, was the youngest of the sons of Edward the Elder, by his wife Edgiva. [EDWARD THE ELDER.] When the throne became vacant, in 946, by the death of his elder brother, Edmund I., Edred was recognised as his successor. Edwy and Edgar, the two sons of Edmund, being considered to be excluded for the present by their extreme youth. Edred was in a bad state of health when he came to the throne, and he does not seem ever to have recovered. Yet he is recorded to have, soon after his accession, repressed in person an insurrection of the turbulent Danish population of Northumberland; and he appears to have reduced that province to greater quiet and subjection than any of his predecessors. In these military operations, as well as in the management of civil affairs, he was mainly directed by the counsels of his chancellor Turketul, who had served in the same capacity under the two preceding kings, Athelstane and Edmund. Another distinguished character of this reign was the celebrated Dunstan, who owed his first rise at court to the patronage of Turketul, and acquired under Edred that extraordinary power in the state which he preserved during several succeeding reigns. [DUNSTAN.] Edred died, after a reign of between nine and ten years, on the 23rd of November (St. Clement's Day), 955, and was succeeded by his nephew Edwy, the eldest of the two sons of his predecessor, king Edmund.

EDRISI, with his complete name Abu-Abdallah Mohammed ben Mohammed ben Abdallah ben Edris, a well known Arabian writer on Geography, who flourished about the middle of the sixth century of the Mohammedan era. Of the circumstances of his life little is known. He was a descendant of the family of the Edrisides, who for upwards of a century possessed the sovereignty over the Mohammedan provinces of Northern Africa. When, in A.D. 919, the Edriside dynasty in Africa was overthrown by Mahedi Abdallah, the survivors of the family went to Sicily; and there our Edrisi seems to have been born. The geographical treatise, which has made his name celebrated, was written at the command of Roger II. king of Sicily, whom he frequently mentions in the body of the work; he informs us in the preface that he completed it in the year 548 of the Hegira, A.D. 1153-4; and that it was intended to illustrate a silver terrestrial globe, 450 Greek pounds in weight, which King Roger had caused to be made. The time at which he wrote it is further ascertained from an incidental allusion to the fact of the town of Jerusalem being then in the possession of the Christians, which occurs in the work, and to the capture of Tripolis and Bona by Roger, which events happened in the years 540 and 548 of the Hegira (1145-6 and 1153-4 of our era). The work itself also affords internal evidence of its having been written by a person who had visited Spain and Italy. Gabriel Sionita and Johannes Hesronita, who, in 1619, published a Latin translation of an abridgment of Edrisi's work, were induced by an erroneous reading of the only manuscript which they had, in a passage where Edrisi speaks of the Nile dividing the country adjoining it into two halves (*ardind* 'our country,' instead of *ardihā* 'its country,' the true reading), to suppose him a native of Nubia; and this mistake gave occasion to the designation of Geographus Nubiensis, under which Edrisi, of whose real name the translators were ignorant, soon became universally known. His work bears the title 'Nuzhat al-mushtāk fi ikhtirāk al-Afāk,' i.e. 'Amusement of the curious in the exploring of countries.' Besides the abridged translation above mentioned, we now possess a French version of what seems to be the complete original work, by M. Amédée Jaubert, made from two Arabic manuscripts, the one found in the royal library at Paris, the other (which is accompanied with maps) recently procured in Egypt by M. Asselin, and now likewise belonging to the Bibliothèque du Roi. Two other manuscripts of the original work of Edrisi are preserved in the Bodleian library at Oxford (Cod. Graves, No. 3837, and Cod. Pocock, 375). The globe which this treatise was intended to illustrate is entirely lost; but a planisphere, which is inserted in one of the Bodleian manuscripts, may be seen engraved in Vincent's 'Periplus of the Erythrean Sea,' who observes (p. 568) that "it is evidently founded upon the error of Ptolemy, which carries the coast of Africa round to the east, and forms a southern continent totally excluding the circumnavigation into the Atlantic Ocean." It appears, from a comparison of this planisphere with the maps of Fra Mauro and the globe of Martin Behem at Nürnberg, that for upwards of three centuries the globe of Edrisi remained the foundation upon which all subsequent representations of the earth's surface were constructed. In his descriptive treatise,

Edrisi, like all other Arabian geographers, distributes the portion of the globe known at his time into seven climates, each of which he subdivides into ten regions: in the account which he gives of them he follows the uniform plan of proceeding from west to east; but he does not, like Abulfeda, determine the longitude and latitude of the places which he mentions. The abridgment of the work contains little more than an itinerary of these different regions; but the original performance now translated adds many remarks on their inhabitants, natural productions, &c. Edrisi frequently refers to writers that have preceded him: among others to an Arabic translation of Ptolemy of Claudias, to Abdallah ben Khordadbeh, and Masudi.

The Arabic text of the abridgment of Edrisi's work, which is now extremely scarce, appeared under the following Latin title: '*De Geographia universali, Hortulus cultissimus, mire orbis regiones, provincias, insulas, urbes, earumque dimensiones et orizonta, describens*,' Rome, in typographia Medicea, 1592, 4to. The Latin translation of the same by Gabriel Sionita and Johannes Hesronita, bears the title: '*Geographia Nubiensis, id est, accuratissima totius orbis in septem climata divisi descriptio*,' Paris, 1819, 4to. Of other publications relating to the work of Edrisi we shall mention only two: '*Descripcion de España de Xerif Aledris conocido por el Nubiense*,' con traduccion y notas de Don J. A. Conde, Madrid, 1799, 8vo; and J. M. Hartmann's '*Commentatio de Geographia Africæ Edrisiana*,' Göttingen, 1791, 4to. M. Jaubert's French translation appeared under the auspices of the French Geographical Society, and forms the fifth and sixth volumes of the '*Recueil de Voyages et de Mémoires*,' published by that society. It has also the following separate title, '*Géographie d'Edrisi, traduite de l'Arabe en Français, d'après deux MSS. de la Bibliothèque du Roi, et accompagnée de notes par M. Amédée Jaubert*,' Paris, 1836, 1840, 4to.

EDWARD I., surnamed the Elder, King of the West Saxons, and with some pretensions to be regarded as king of all England, was the eldest son of Alfred the Great, by his queen Alswitha, the daughter of Earl Ethelred. On the death of his father, 26th of October 901, Edward was recognised by the Witenagemote as his successor; but the throne was contested by his cousin Ethelwald, who was the son of Ethelred, one of the three elder brothers and predecessors of Alfred. The cause of Ethelwald received from the first the support of the Danes of the north, and by their assistance in 904 he compelled the submission of the people of Essex, and in the following year that of the East Anglians. The contest however was at length terminated in 906 or 907 by the death of Ethelwald, in a battle fought between his forces and those of Edward. The people of East Anglia on this returned under submission to the king of Wessex, and the Northumbrian Danes concluded a peace with him; but three or four years afterwards we find the Danes breaking this pacification, nor do they appear to have been quieted, or the people of Essex finally brought back to their obedience, till the year 920 or 921. Mercia in the meantime had continued to be governed as a separate state, though subject to the supremacy of Wessex, first by the ealdorman Etheard, or Ethelred, to whom it had been entrusted by Alfred, and after his death in 912 by his widow Ethelfleda, the sister of Edward. The Lady Ethelfleda survived till 920, conducting the affairs of her government with distinguished ability, and all along acting in concert with her brother in his efforts against the Danes and his other enemies. On her death, Edward took the government of Mercia into his own hands. After this, if we may believe the old historians, not only did all the Danes, including even those of Northumbria, make full submission to Edward, but their example was followed by the Welsh and the people of Strathclyde, and the king of the Scots and all his subjects also chose the English monarch as their lord. The military successes however, which must have been achieved to compel the submission of all these neighbouring powers, if such submission actually took place, are not recorded.

Some of the laws of Edward the Elder are preserved, but they do not demand any particular notice. He died in 925, and was succeeded by his eldest son Athelstane, born to him by a shepherd's daughter named Egwina, who is stated by some of the old writers to have been his wife, by others only his mistress. He had also another son and a daughter by Egwina. By another lady, to whom he is allowed to have been married, but whose name is unknown, he had two sons and six daughters; and by another wife, Edgiva, he had two sons, Edmund and Edred, both of whom were afterwards kings of England, and two daughters.

EDWARD II., King of the Anglo-Saxons, surnamed the Martyr, was the eldest son of Edgar the Peaceable, by his first wife, Elfreda. On the death of Edgar in 975, the accession of Edward was opposed by a faction headed by his father's widow, Elfrida, who, on the pretence that the elder brother was excluded by the circumstance of having been born before his father had been crowned, maintained that the right to the vacant throne lay with her own son Ethelred. To create for herself the appearance of a national party, she and her associates proclaimed themselves the patrons of the cause of the married clergy in opposition to Dunstan and the monks; but after a short period of confusion the latter prevailed in the Witenagemote, and Edward was formally accepted as king by that assembly. Elfrida however seems still to have continued her intrigues, and her unscrupulous ambition at last led her to the perpetration of a deed which has covered her name with infamy. This was the murder of her step-son by a hired

assassin, as he stopped one day while hunting at her residence, Corfe Castle, in Dorsetshire: he was stabbed in the back as he sat on his horse at the gate of the castle drinking a cup of mead. The 18th of March 978 is the date assigned to the murder of King Edward, who was only in his seventeenth year when he was thus cut off. He was never married, and leaving no children, was succeeded by his half-brother, Ethelred, the only individual then remaining whose birth gave him any pretensions to the throne.

It was in the reign of Edward that the national council for determining the question at issue between the secular and monastic clergy was held at Calne, which is so famous for the catastrophe of the floor giving way, with the exception of the part on which Dunstan and his friends stood. [DUNSTAN.]

EDWARD III., King of the Anglo-Saxons, surnamed the Confessor, was the eldest of the two sons of Ethelred II. by his second wife Emma, the daughter of Richard I., duke of Normandy. He was born at Islip, in Oxfordshire, probably in the year 1004. In the close of 1013, when the successes of Sweyn, the Dane, drove Ethelred from his throne, and compelled him to retire to the Isle of Wight, he sent over his wife, with Edward and his younger brother Alfred, to Normandy, to the care of their uncle Duke Richard II. Hither Ethelred himself, being assured of a favourable reception, followed his family, about the middle of January 1014. When, on the death of Sweyn, within three weeks after, Ethelred was recalled by the Witenagemote, he sent back his son Edward along with the plenipotentiaries, whom he despatched previously to setting out himself to complete the arrangements for his restoration. On the death of Ethelred in 1016, Emma and her two sons returned to Normandy. When Canute the Dane obtained the throne in the latter part of the same year by the death of Edmund Ironside, it is affirmed that Duke Richard either fitted out a naval force or threatened to do so, with a view of supporting the claims of his nephew Edward; but this intention, if it ever was entertained, was effectually diverted before it led to anything by the proposals which now proceeded from Canute for the hand of the widowed Emma. Canute and Emma were married in July 1017. From this time till the death of Canute in 1035, Edward appears to have remained quiet in Normandy. He is said to have spent his time chiefly in the performance of the offices of religion and in hunting, which continued to be his favourite occupations to the end of his days. On Canute's death, and the disputes for the succession between his sons Harold and Hardicanute, Edward was induced to make a momentary demonstration in assertion of his pretensions: he crossed the channel with a fleet of forty ships, and landed at Southampton; but finding that instead of being supported, he would be vigorously opposed by his mother, who was exerting all her efforts for her son Hardicanute, he gave up the attempt, and returned to Normandy after merely plundering a few villages. In 1037 his younger brother Alfred was tempted by an invitation purporting to come from Emma to proceed to England at the head of another expedition, which terminated in his destruction, brought about apparently by treachery, though there does not seem to be any sufficient ground for the horrid suspicion, which some writers have been disposed to entertain, that the contriver of the plot was his own mother. When Hardicanute became undisputed king of all England by the death of Harold in 1040, he sent for his half-brother Edward, who immediately came to England, where he was allowed a handsome establishment, and appears to have been considered as the heir to the crown in default of issue of the reigning king. Hardicanute died on the 4th of June 1042, and Edward was immediately recognised as king by the assembled body of the clerical and lay nobility; the former, it is said, having been chiefly swayed by Livingus, bishop of Worcester, the latter by the powerful Earl Godwin.

A menace of opposition to this settlement of the English crown by Magnus, king of Norway, was defeated, after it had put Edward to the expense of fitting out a fleet to maintain his rights, first by the occupation which Magnus found at home in defending himself against another claimant to the Danish throne, Sweyn, the nephew of Canute, and soon after, more effectually, by the death of Magnus. In 1044, Edward, probably in compliance with a promise which he had made to Godwin, married Editha, the only daughter of that earl, having previously informed her however that although he would make her his queen, she should not share his bed. This unnatural proceeding, by which Edward gained from his church the honour of canonisation and the title of Confessor, and by which, to pass over his treatment of his wife and his violation of his marriage vows, he involved his country in the calamities of a disputed succession, and eventually of a foreign conquest, has been usually attributed to religious motives. The Confessor seems to have been without human affections of any kind. His first act after coming to the throne was to proceed to the residence of his mother at Winchester, and to seize by force not only all her treasures, but even the cattle and corn upon her lands. One account further states that he endeavoured to destroy her by an accusation from which she freed herself by the ordeal—though this part of the story has been generally rejected by modern writers.

The public events that form the history of the reign of the Confessor resolve themselves for the most part into a contest between two great parties or interests which divided the court and the country. The connection between England and Normandy had commenced forty

years before the accession of this king by the marriage of Ethelred; but it became very intimate after the accession of Edward, who had spent in Normandy all his life since his childhood, whose tastes and habits had been formed in that country, and all whose closest personal friends were necessarily Normans. In fact Edward himself, when he came to the throne, was much more a Norman than an Englishman; and he not unnaturally surrounded himself with persons belonging to the nation whose language and manners and mode of life were those with which he had been so long familiar, rather than with his less polished fellow-countrymen. Many Normans came over to England as soon as he became king, and some of the highest preferments in the kingdom were bestowed upon these foreigners. But while the inclinations of Edward were probably from the first with the Normans, he was to a great extent in the hands of the opposite, or English party, from his connection with Earl Godwin, its head. Besides the influence which he derived from having his daughter on the throne, this powerful nobleman held in his own hands, and in those of his sons, the government of more than the half of all England. The eldest of these sons, Sweyn, very early in the reign of Edward, had been obliged to fly from the vengeance of the law for the daring crime of violating the person of an abbess; but after some time Edward consented, or found himself obliged, to pardon him, and to restore him to all his estates and honours. It was not till the year 1051 that the strength of the English and Norman parties was tried in any direct encounter; but that year, on occasion of a broil which arose out of the visit to England of Edward's brother-in-law, Eustace, count of Boulogne, their long-accumulated enmity broke forth into a violent collision. The first effect was the banishment of all the Godwin family, and the degradation and imprisonment of the queen. At this crisis William, the young duke of Normandy, afterwards king of England, came over with a powerful fleet, and prepared to render Edward what assistance he might have needed. The following summer however witnessed the complete overthrow of all that had been thus accomplished. Godwin and his son Harold forced their way back to the country at the head of armaments which they had prepared—the former in Flanders, the latter in Ireland: a negotiation was entered into with the king, and the issue was, that the earl and his party were restored to greater power than ever; the queen was re-established in her possessions and her place, and the Normans were all expelled from the kingdom.

Earl Godwin only survived this counter-revolution a few months; he died suddenly as he sat at the royal table, on the 15th April 1053. His son Harold however inherited his possessions and his power, and the ascendancy of the family under its new head continued as great as ever during the remainder of the Confessor's reign. In 1055 a dispute arose between Harold and the rival family of Leofric, earl of Leicester, which disturbed the kingdom for nearly two years. Leofric died in 1057; but the feud was continued by his son Algar, who called in to his assistance Griffith, or Griffin, king of the Welsh. This drew down the vengeance of Harold upon that prince and his subjects; and the issue was, that, after some fighting, Griffin consented to swear fealty to Edward. This event is assigned by the Saxon chronicle to the year 1056. The war with the Welsh was renewed in 1063: Harold had again the command, and prosecuted hostilities with so much success, that king Griffin's head was cut off by his own subjects, and sent by them to the English king in token of their submission. In 1065 the public tranquillity was for a short time disturbed by an insurrection of the Northumbrians; but this was quelled without bloodshed. Edward died on the 5th of January 1066, and was buried the following day in the new Abbey of Westminster, which had just been finished and consecrated with great pomp about a week before. On the same day Earl Harold was solemnly crowned King of England. [EDGAR ATHELING; HAROLD II.]

England undoubtedly made a considerable advance in civilisation during the reign of the Confessor. For this it was indebted partly to the intercourse which Edward's accession opened with Normandy and France, but perhaps in a still greater degree to the freedom which the kingdom enjoyed from those foreign invasions and internal wars which had distracted it, with the exception of some short intervals of tranquillity, for the greater part of a century preceding. The only events, as we have seen, which disturbed the public peace during the reign of Edward, were one or two border wars and local insurrections, none of which occasioned any general disquiet, or lasted for any considerable time. This period accordingly was long traditionally remembered as the happiest that England had known. It formed in the national imagination the bright spot between the time of the Danish rule on the one hand, and that of the Norman on the other; the age of English freedom and independence which succeeded the deliverance of the country from the one foreign conquest, and preceded its subjection to the other. For many generations after the establishment of the Norman power in the island, the constant demand of the great body of the people to their rulers was for the restoration of the laws and customs of the Confessor. But we have no reason to suppose that this king was the author of any entirely new code of laws, or even that he made any material additions to the laws that had been in force before his time. On coming to the throne he was required by the Witenagemote to promise to observe the laws of King Canute, which seem to have been then universally held to be the fairest and the best the nation had known. Edward took an oath

in conformity with this demand at his coronation. There has been preserved, both in Latin and in Romance, or Romanic French, a body of laws and constitutions which the Conqueror is said to have granted at an assembly of the most distinguished of his English subjects, held about four years after his seizure of the crown, and they are described in the title as the same which his predecessor and cousin, King Edward, had before observed. The French text, preserved in Ingulphus, has generally been held to be the original; but Sir Francis Palgrave has stated reasons which throw considerable doubt upon this supposition. Both versions are given in the most correct form, and accompanied with a learned and valuable commentary, in the *Proofs and Illustrations* appended to Sir Francis Palgrave's '*Rise and Progress of the English Commonwealth*,' pp. lxxxviii.—cxl. (See also Kemble's '*Saxons in England*.')

Edward the Confessor has the credit of being the first of our kings who touched for the king's evil. He was canonised by Pope Alexander III. about a century after his death, and the title of the Confessor was first bestowed upon him in the bull of canonisation. It may also be mentioned, that the use of the Great Seal was first introduced in this reign.

EDWARD I., King of England, surnamed Long-Shanks, from the excessive length of his legs, was the eldest son of King Henry III., by his wife Eleanor, second daughter of Raymond, count of Provence. He was born at Westminster, June 16, 1239. In 1252 he was invested by his father with the duchy of Guienne; but a claim being set up to this territory by Alphonso X., king of Castile, who pretended that it had been made over to his ancestor Alphonso VIII. by his father-in-law, Henry II., it was arranged the following year that the dispute should be settled by the marriage of Prince Edward with Eleanor, the sister of Alphonso, who thereupon resigned whatever right he had to the duchy to his brother-in-law. After this, by letters patent, dated February 14, 1254, we find the lordship of Ireland, and by others dated February 18, in the same year, all the provinces which had been seized from his father, John, by the King of France, granted by Henry III. to his son Prince Edward. (Rymer I.)

Edward early manifested a character very unlike that of his weak and imprudent father. While yet only entering upon manhood, we find him taking part in important affairs of state. Thus the agreement which Henry made in 1256 with Pope Alexander IV. in relation to the kingdom of Sicily, which the pope granted to Henry's second son Edmund, was ratified by Prince Edward in a letter to his Holiness, still preserved. In 1258 he signed, along with his father, the agreement called the Provisions or Statutes of Oxford, by which it was arranged that the government of the country should be put into the hands of twenty-four commissioners, appointed by the barons; and two years after, when Henry violently broke through this engagement, Edward came over from Guienne, where he was resident, and publicly expressed his disapprobation of the king's conduct. For the next two or three years Edward may be regarded as placed in opposition to his father's government. In 1262 however Henry, in a visit which he paid him in Guienne, succeeded in gaining him over to his side, and from this time the prince became the king's most efficient supporter. In the summer of 1263, the quarrel between Henry and his barons came to a contest of arms, which lasted, with some brief intermissions, for four years. During this period the military operations on the king's side were principally conducted by Prince Edward. In the beginning he was unfortunate, having been driven first from Bristol and then from Windsor, and having been finally defeated and taken prisoner with his father at the battle of Lewes, fought May 14, 1264. After being detained however about a twelvemonth, he made his escape out of the hands of the Earl of Leicester; and on the 4th of August, 1265, his forces having encountered those of that nobleman at Evesham, the result was that Leicester was defeated and lost his life, and the king was restored to liberty. From this time Edward and his father carried everything before them till the war was concluded, in July 1267, by the surrender of the last of the insurgents, who had taken up their position in the Isle of Ely.

Soon after this, at a parliament held at Northampton, Prince Edward, together with several noblemen and a great number of knights, pledged themselves to proceed to join the crusaders in the Holy Land. The prince, accordingly, having first, in a visit to Paris, in August, 1269, made his arrangements with St. Louis, set sail from England to join that king in May, the year following. St. Louis died on his way to Palestine; and Edward, having spent the winter in Sicily waiting for him, did not arrive at the scene of action till the end of May, 1271. Here he performed several valorous exploits, which however were attended with no important result. His most memorable adventure was an encounter with a Saracen, who attempted to assassinate him, and whom he slew on the spot, but not before he had received a wound in the arm from a poisoned dagger, from the effects of which he is said to have been delivered by the princess, his wife, who sucked the poison from the wound. At last, having concluded a ten years' truce with the Saracens, he left Palestine in August 1272, and set out on his return to England. He was at Messina, on his way home, in January 1273, when he heard of the death of his father on the 16th of November preceding. He proceeded on his journey, and landed with his queen in England 25th July 1274. They were both solemnly crowned at Westminster on

the 19th of August following. The reign of Edward I. however appears to have been reckoned not from the day of his coronation, according to the practice observed in the cases of all the preceding kings since the Conquest, but according to the modern practice, from the day on which the throne became vacant, or rather from the 20th of November, the day of his father's funeral, immediately after which the clerical and lay nobility who were present in Westminster Abbey on the occasion had sworn fealty to the new king at the high altar of that church.

The first military operations of Edward's reign were directed against the Welsh, whose prince Llewellyn, on being summoned to do homage, had contemptuously refused. Llewellyn was forced to sue for peace in November 1277, after a single campaign; but in 1281 he again rose in arms, and the insurrection was not put down till Llewellyn himself was slain at Llanfair, 11th December 1282, and his surviving brother Prince David was taken prisoner soon after. The following year the last-mentioned prince was barbarously put to death by drawing, hanging, and quartering, and Wales was finally united to England.

The conquest of Wales was followed by the attempt to conquer Scotland. By the death of Alexander III. in 1285, the crown of that country had fallen to his grand-daughter Margaret, called the Maiden of Norway, a child only three years old. By the treaty of Brigham, concluded in July 1290, it was agreed that Margaret should be married to Edward, the eldest surviving son of the English king; but the young queen died in one of the Orkney Islands on her voyage from Norway, in September of the same year. Edward made the first open declaration of his designs against the independence of Scotland at a conference held at Norham on the Tweed with the clergy and nobility of that kingdom on the 10th of May 1291. Ten different competitors for the crown had advanced their claims; but they were all induced to acknowledge Edward for their lord paramount, and to consent to receive judgment from him on the matter in dispute. His decision was finally pronounced in favour of John Balliol, on the 17th of November 1292; on the next day Balliol swore fealty to him in the castle of Norham. [BALLIOL.] He was crowned at Scone under a commission from his liege lord on the 30th of the same month; and on the 26th of December he did homage to Edward for his crown at Newcastle. The subject king however was soon made to feel all the humiliation of his position; and the discontent of his countrymen equalled his own, by the summer of 1294 all Scotland was in open insurrection against the authority of Edward. Meanwhile Edward had become involved in a war with the French king Philip IV. The first act of the assembled estates of Scotland was to enter into a treaty of alliance with that sovereign. But although he was farther embarrassed at this inconvenient moment by a revolt of the Welsh, Edward's wonderful energy in a few months recovered for him all that he had lost. In the spring of 1296 he laid a great part of Scotland waste with fire and sword, compelled Balliol to resign the kingdom into his hands, and then made a triumphant progress through the country as far as Elgin in Moray, exacting oaths of fealty from all classes wherever he appeared. It was on his return from this progress that Edward, as he passed the cathedral of Scone in the beginning of August, carried away with him the famous stone, now in Westminster Abbey, on which the Scottish kings had been accustomed to be crowned. He now placed the government of Scotland in the hands of officers appointed by himself, and bearing the titles of his ministers. But by the month of May in the following year Scotland was again in flames. The leader of the insurrection now was the celebrated William Wallace. He and his countrymen had been excited to make this attempt to effect their deliverance from a foreign domination, partly by the severities of their English governors, partly by the circumstances in which Edward was at this time involved. The expenses of his Scottish and French wars had pressed heavily upon the resources of the kingdom; and when he asked for more money, both clergy and laity refused to make him any farther grant without a redress of grievances and a confirmation of the several great national charters. After standing out for some time, he was obliged to comply with these terms: Magna Charta and the Charter of Forests were both confirmed, with some additional articles, in a parliament held at Westminster in October of this year.

Meanwhile, although he had got disencumbered for the present of the war on the Continent, by the conclusion of a truce with King Philip, the rebellion in Scotland had already gained such a height as to have almost wholly cleared that country of the English authorities. The forces of the government had been completely put to the rout by Wallace at the battle of Stirling, fought on the 11th September, and in a few weeks more not a Scottish fortress remained in Edward's hands. Wallace was now appointed Governor of Scotland in the name of King John (Balliol). In this state of things Edward, about the middle of March 1298, returned to England from Flanders, where he had spent the winter. He immediately prepared to march for Scotland. The great battle of Falkirk followed on the 22nd of July, in which Wallace sustained a complete defeat. But although one consequence of this event was the resignation by Wallace of his office of governor, it was not followed by the general submission of the country. The next five years were spent in a succession of indecisive attempts on the part of the English king to regain possession of Scot-

land; the military operations being frequently suspended by long truces. At length, having satisfied his barons by repeated renewals of the charters, and having finally relieved himself from all interference on the part of the king of France by a definitive treaty of peace concluded with him at Amiens, on the 20th May 1303, Edward once more set out for Scotland at the head of a force too numerous and too well appointed to be resisted by any strength that exhausted country could now command. The result was again its temporary conquest, and merciless devastation from the Tweed to the Moray Firth. The Castle of Stirling was the last fortress that held out; it did not surrender till the 20th of July in the following year. Edward meanwhile had wintered in Dunfermline; he only returned to England in time to keep his Christmas in Lincoln. Wallace fell into his hands in a few months afterwards, and was hanged, drawn, and quartered as a traitor, at Smithfield in London, on the 23rd of August 1305. But another champion of the Scottish independence was not long in appearing. Robert Bruce, Earl of Carrick, whose grandfather had been the chief competitor for the crown with Balliol, had resided for some years at the English court; but he now, in the beginning of February 1306, suddenly made his escape to Scotland; and in a few weeks the banner of revolt against the English dominion was again unfurled in that country, and the insurgent people gathered around this new leader. Bruce was solemnly crowned at Scone, on the 27th of March. On receiving this news, Edward immediately prepared for a new expedition to Scotland; and sent the Earl of Pembroke forward to encounter Bruce, intending to follow himself as soon as he had completed the necessary arrangements. The army of Bruce was dispersed at Perth, on the 19th of June, by Pembroke, who had thrown himself into that town; and the king of the Scots became for a time a houseless fugitive. But the English monarch had now reached the last stage of his destructive career. Edward got no farther than a few miles beyond Carlisle in his last journey to the north. After spending the winter months at Lanercost, where he was detained by a severe illness, he appears to have arrived at Carlisle in the beginning of March 1307; here he was again taken ill, but his eagerness to advance continued unabated: having somewhat recovered, he again set out, although he was still so weak, and suffered so much from pain, that he could accomplish no more than six miles in four days. On the 6th of July he reached the village of Burgh-upon-Sands, "and next day expired," to copy the words of Lord Hailes, "in sight of that country which he had devoted to destruction." On his death-bed he is said to have enjoined his son and successor to prosecute the design which it was not given to himself to finish. According to Froissart, he made him swear that after the breath had departed from the royal body he would cause it to be boiled in a cauldron till the flesh fell off, and that he would preserve the bones to carry with him against the Scots as often as they should rebel. This oath however, if it was taken, was not kept. The corpse of King Edward was interred in Westminster Abbey on the 28th of October.

Edward I. was twice married. By his first wife Eleanor, daughter of Ferdinand III., king of Castile and Leon, he had four sons: John and Henry, who both died in infancy while their father was in the Holy Land; Alphonso, born at Maine in Gascony, 23rd November 1273, who died at Windsor, 4th August 1285; and Edward, who succeeded him. He had also by Eleanor nine daughters: Eleanor, born in 1266, married to Henry earl of Bar; Joanna of Acre, born in that town in 1272, married first to Gilbert de Clare, earl of Gloucester and Hereford, and secondly to Sir Ralph Monthermer; Margaret, born in 1275, married to John duke of Brabant; Berengera, born in 1276; Alice; Mary, born 22nd April 1279, who at ten years of age took the veil in the monastery of Ambresbury; Elizabeth, born in 1284, married first to John earl of Holland and Zealand, secondly, to Humphrey Bohun earl of Hertford and Essex; Beatrice; and Blanch. Queen Eleanor died 28th November 1291, at Grantham, or, according to another account, at Hardeby, in Lincolnshire: her body was brought to Westminster Abbey to be interred, and crosses were afterwards erected on the several spots where it rested on the way, namely, at Lincoln, Grantham, Stamford, Goddington, Northampton (near which town one exists), Stoney Stratford, Dunstable, St. Albans, Waltham (where the cross, a very beautiful one, still stands), and Charing, then a village near London, but now the centre of the metropolis, under the name of Charing Cross. Edward's second wife was Margaret, eldest daughter of Philip III., and sister of Philip IV., kings of France. He was married to her on the 10th of September 1299, she being then in her eighteenth year. By Queen Margaret he had two sons: Thomas, born at Brotherton in Yorkshire, 1st June 1300, afterwards created Earl of Norfolk and earl marshal; and Edmund, born 5th August 1301, afterwards created Earl of Kent; and one daughter, Eleanor, born at Winchester, 6th May 1306, who died in her childhood. Queen Margaret died in 1317.

The rapid narrative that has been given of the acts of his reign sufficiently indicates the main constituents of the character of this king. He had his full share of the ability and the daring of the vigorous line from which he was sprung; a line that (including himself) had now given nine kings to England, and only two of them not men of extraordinary force of character. With all his ambition and stern determination however Edward neither loved bloodshed for itself, nor was he a professed or systematic despoiler of the rules of

right and justice. It is probable that in his persevering contest with the Scots he believed that he was only enforcing the just claims of his crown; and his conduct, therefore, ferocious and vindictive as in many respects it was, may be vindicated from the charge of want of principle, if tried by the current opinions and sentiments of his age. Putting aside considerations of morality, we perceive in him an ample endowment of many of the qualities that most conduce to eminence—activity, decision, foresight, inflexibility, perseverance, military skill, personal courage and power of endurance; and, united with boldness in conceiving and executing his designs, great patience and sagacity in preparing and managing his instruments, and bending circumstances to his will. Engaged as he was during the greater part of his reign in war, he was not advantageously placed for the full application of his talents to the business of civil government; but his reign is notwithstanding one of the most remarkable in our history, for the progress which was made in it towards the settlement of the laws and the constitution. On this account Edward I. has often been styled the English Justinian (though, as is obvious to any one who knows what Justinian's legislation was, not with any propriety); and Sir Matthew Hale ('Hist. of the Common Law of England,' chap. 7) has remarked that more was done in the first thirteen years of his reign to settle and establish the distributive justice of the kingdom than in all the next four centuries. Blackstone has enumerated under fifteen heads the principal alterations and improvements which the law underwent in the reign of Edward I.: we can only here notice the confirmation and final establishment of the two great charters; the definition and limitation of the bounds of ecclesiastical jurisdiction; the ascertainment and distribution of the powers and functions both of the supreme and the inferior courts; the abolition of the practice of issuing royal mandates in private causes; the establishment of a repository for the public records of the kingdom, "few of which," as Blackstone remarks, "are antienter than the reign of his father, and those were by him collected;" the improvement of the law and process for the recovery of debts by the Statutes Merchant and Elegit; and the check imposed on the encroachments of the church by the passing of several statutes of mortmain. The object of the statute *De Donis* was to render lands which were the subject of this particular form of grant inalienable, and so far to put restraints upon the disposal of landed property, which however were soon evaded. "Upon the whole, we may observe," concludes Blackstone after Hale, "that the very scheme and model of the administration of common justice between party and party was entirely settled by this king." The forms of writs by which actions are commenced, it is added, were perfected in this reign.

While the English laws were fully extended to Ireland and Wales, it was under Edward I., also, that the foundations of the constitution of the kingdom may be considered to have been laid by the new form and the new powers which were then assumed by the parliament. The earliest writs that have been preserved for summoning knights, citizens, and burgesses to parliament, are, as is well known, those that were issued by Simon de Montfort, earl of Leicester, the leader of the barons, in 1264, in the name of king Henry III., who was then a prisoner in his hands. Whether this representation of the commons was then first introduced or not, it was in the course of the succeeding reign that it first became regular and influential. The division of the legislature into two houses, in other words the institution of our present House of Commons, appears to be clearly traceable to the time of Edward I. It was in his time also that the practice began fairly to take root of the king refraining from arbitrary exactions and coming to parliament for supplies, and that the earliest effective examples were afforded of the grant of supplies by that assembly being made dependent upon the redress of grievances. Edward I., with all his military habits and genius, had at length the good sense to perceive that the time was come for abandoning the attempt to govern by the prerogative alone, which had been clung to by all his predecessors from the Conquest: in his disputes with the barons he never allowed matters to come to a contest of force, as his father and grandfather had done; and in the latter part of his reign, although more than once compelled to stop short in his most favourite designs by the refusal of the national representatives to furnish him with the necessary means, he seems to have kept to the system of never resorting to any other weapon than policy and management to overcome the opposition with which he was thus thwarted. It was in the last year but one of this reign that the royal assent was given to the famous enactment commonly called the '*Statute de Tallagio non Concedendo*,' by which the right of taxation was first distinctly affirmed to reside in the parliament: "no tallage or aid," the first chapter runs (in the old English translation), "shall be levied by us or our heirs in our realm, without the good will and assent of Archbishops, Bishops, Earls, Barons, Knights, Burgesses, and other Freemen of the land." The same principle had been conceded ten years before (by the 25th Edward I., c. 6), but not in such explicit terms.

The trade and foreign commerce of England appear to have advanced considerably during the reign of Edward I.; but rather owing to the natural progress of the civilisation of this country and of Europe, than from any enlightened attention which the king showed to these interests. He seems to have been principally solicitous to turn the increasing intercourse of the country with foreign parts to his

own particular profit by the increase of the customs. A few of his laws however were beneficial to the trading community, and were made with this express object, especially the act for the better recovery of debts, commonly called the Statute of Merchants, passed at Acton-Burnell in 1283; the extension of the same by a subsequent act; and the *Elegit* above mentioned. On the other hand he lowered, though slightly, the real value of the coin, thereby setting the first example of a most pernicious process, which was afterwards carried much farther. He also cruelly pillaged and oppressed the Jews; and finally, in 1290, expelled the entire body of that people from England, and seized all their houses and tenements. Before this (in 1275) a law had been passed prohibiting the Jews from taking interest for money on pain of death.

The most distinguished names in literature and science that belong to the reign of Edward I. are Duns Scotus, his disciple William Occam, and the illustrious Roger Bacon. Among the historical writers or chroniclers who flourished at this time may be mentioned Thomas Wikes, Nicolas Trivet, Walter de Hemmingford, and, according to one account, the writer known as Matthew of Westminster. The law writers of this reign are the author of the work entitled '*Fleta*,' Britton (if that be not a corruption of Bracton), Hengham, and Gilbert de Thornton, chief justice of the King's Bench, the author of an abridgment of Bracton.

EDWARD II., the eldest surviving son of Edward I., was born at Caernarvon 25th April 1284, and became the heir apparent to the crown by the death of his elder brother, Alphonso, a few months after. In 1289 he was affianced to the young queen of Scotland, who died the following year. On the 1st of August 1297 his father, before setting out for Flanders, assembled a great council at London, and made the nobility swear fealty to the prince, whom he then appointed regent during his absence. The parliament in which the first statute '*De Tallagio non Concedendo*' received the royal assent was held at Westminster by Prince Edward a few months after his father's departure. In the summer of 1300 we find him accompanying his father in a military expedition to Scotland, and he is particularly mentioned as leading one of the divisions of the army, called the '*Shining Battalion*,' in an encounter with the Scottish forces on the banks of the river Irvine. As he grew towards manhood however he appears to have begun to form those vicious associations which were the chief source of the calamities of his life. In October of this same year (1300) the notorious Piers Gaveston was banished by the king from about the person of Prince Edward, who, through his persuasion, had been guilty of several outrages against the Bishop of Lichfield, and the prince himself was ordered to prison for stealing the bishop's deer. Gaveston was the son of a knight of Gascony, and is admitted to have been distinguished by his wit and accomplishments as well as by his personal advantages, but he is affirmed to have, as the prince's minion, carried himself to men of all ranks with unbearable insolence. In 1301 Edward was created Prince of Wales and Earl of Chester. He was again in Scotland with his father in the expedition in the summer of 1303: while the king proceeded along the east coast, the prince marched westward, and afterwards wintered in Perth, while his father remained in Dunfermline. When Edward was preparing for his last Scottish expedition after the insurrection under Robert Bruce, he knighted his eldest son at Westminster on the morrow of Whitsuntide 1306; after which the prince bestowed the same honour on 300 gentlemen, his intended companions in arms. He was at the same time invested by his father with the duchy of Guienne. The royal banquet that was given on this occasion is celebrated for what is called the '*Vow of the Swans*,' an oath taken by the king to God and to two swans, which were brought in and set upon the table, that he would take vengeance on Robert Bruce and punish the treachery of the Scots. The prince also vowed that he would not remain two nights in the same place until he reached Scotland. He set out accordingly before his father, and as soon as he had crossed the borders he began to signalise his march by such unsparing devastation that even the old king is said to have reproved him for his cruelty. While King Edward was at Lanercost in February 1307, he found it necessary, with the consent of the parliament there assembled, to issue an order banishing Gaveston for ever from the kingdom, as a corrupter of the prince. It is doubtful, notwithstanding the story told by Froissart [Edward I.] if the Prince of Wales was with his father when he died on the 7th of July following; but he was at any rate at no great distance, and he was immediately recognised as king. His reign appears to have been reckoned from the day following.

The new king obeyed his father's injunctions to prosecute the war with Scotland by proceeding on his march into that country as far as Cumnock in Ayrshire; but here he turned round without having done anything, and made his way back to England. Meanwhile his whole mind seems to have been occupied only with one object—the advancement of the favourite. A few dates will best show the violence of his infatuation. His first recorded act of government was to confer upon Gaveston, now recalled to England, the earldom of Cornwall, a dignity which had hitherto been held only by princes of the blood, and had a few years before reverted to the crown by the death, without issue, of Edmund Plantagenet, the late king's cousin. The grant, bestowing all the lands of the earldom as well as the dignity, is dated at Dumfries, the 6th of August 1307. About the same time Walter de

Langton, bishop of Lichfield, who was lord high treasurer, was imprisoned in Wallingford Castle, as having been the principal promoter of Gaveston's banishment. In October the new Earl of Cornwall married the king's niece, Margaret de Clare, the daughter of his sister Joanna, countess of Gloucester. He was also made guardian during his minority to her brother, the young earl. The grant of several other lordships followed immediately, and it is even said that the reckless prodigality of the weak king went the length of making over all the treasure his father had collected for the Scottish war, amounting to nearly a hundred thousand pounds, to the object of his insane attachment. Finally, he left him guardian of the realm while he set out for Boulogne in January 1308, to marry Isabella, the daughter of the French king, Philip V., to whom he had been affianced ever since the treaty concluded between Philip and his father in 1299. The marriage took place on the 25th of January, and on the 25th of February the king and queen were crowned at Westminster.

The history of the kingdom for the next five years is merely that of a long struggle between the king and his disgusted nobility about this Gaveston. The banishment of the favourite being insisted upon by a formidable league of the barons, Edward was obliged to yield; but instead of being ignominiously sent out of the country, Gaveston was merely appointed to the government of Ireland. In June his royal master accompanied him as far as Bristol on his way to that country. Even from this honourable exile however he returned in October following. The barons immediately again remonstrated, and in March 1310 the king found himself compelled to sign a commission by which he resigned the government of the kingdom for the ensuing year into the hands of a committee appointed by the parliament. A sentence of banishment was soon after passed upon Gaveston, and he retired to France; but by the close of the year 1311 we find him again in England. The Earl of Lancaster, the king's cousin, now placed himself at the head of the malecontents: finding petitions and remonstrances unattended to, he and his associates at length openly rose in arms. Gaveston was besieged in Scarborough Castle, and having been forced to surrender, his career was ended by his summary execution at Warwick on the 19th of June 1312. Having thus attained their main object, the insurgent barons made their submission to the king, and a peace was finally concluded between the parties in December.

In the course of the last two or three years, Robert Bruce, left unmolested in Scotland, had not only nearly recovered every place of strength in that country, but had been accustomed to make an annual plundering inroad across the borders. It was now determined to take advantage of the cessation of domestic dissensions to effect the reconquest of the northern kingdom; and in June 1314 Edward set out for that purpose at the head of the most numerous army that had ever been raised in England. The issue of this expedition was the signal defeat sustained at the battle of Bannockburn, fought the 24th of June, at which the magnificent host of the English king was completely scattered, he himself narrowly escaping captivity. After this the few remaining fortresses in Scotland that were still held by English garrisons speedily fell into the hands of Bruce; the predatory and devastating incursions of the Scots into England were renewed with more audacity than ever; and Bruce and his brother Edward even made a descent upon Ireland, and for some time contested the dominion of that island with its English masters. At length, in September 1319, a truce for two years with the Scots was arranged with difficulty. Nor was it long observed by the party most interested in breaking it. The Scots easily found pretences on which to renew their attacks, and Edward's efforts to check them proved as impotent as before.

Meanwhile, a new favourite began to engross him, Hugh le Despencer, the son of a nobleman of the same name. Upon him Edward now bestowed another daughter of his sister, the Countess of Gloucester, in marriage, and many large possessions. Another armed insurrection of the barons was the consequence; and in July 1321 the Despençers, father and son, were both banished by act of parliament. Before the end of the same year however they were recalled by the king; and now for a short time the fortune of the contest changed. The Earl of Lancaster was taken and beheaded at Pontefract on the 23rd of March 1322; and the sentence against the Despençers was soon after formally revoked by parliament. About twenty of the leaders of the insurrection in all were put to death; but the estates of many more were forfeited, and most of the immense amount of plunder thus obtained by the crown was at once bestowed upon the younger Despencer. Edward, imagining that he had now an opportunity of which he might take advantage, set out once more for the conquest of Scotland in August 1322; but after advancing as far as Culross, in Fife, he returned without having accomplished anything more than the destruction of a few religious houses; and on the 30th of March 1323 he concluded another truce with the Scots, to last for thirteen years.

New storms however were already rising against the unhappy king. Charles IV., called the Fair, the youngest brother of Edward's queen, had recently succeeded to the French throne, and had begun his reign by quarrelling on some pretence with his brother-in-law, and seizing Guienne and Edward's other territories in France. After some other attempts at negotiation, it was resolved that Queen Isabella should

herself go over to France to endeavour to bring about an arrangement. The queen had been already excited against the Despençers; she had long probably despised a husband who was the object of such general contempt, and who besides openly preferred his male favourites to her society. At the French court she found collected many English nobles and other persons of distinction, whom their dissatisfaction with the state of affairs, or the enmity of the Despençers, had driven from their country. All these circumstances considered, it is easy to understand how she might naturally become the centre and head of a combination formed by the discontented exiles among whom she was thrown, and their connections still in England, for the professed object of compelling her husband to change his system of government and of removing the pernicious power that stood between the nation and the throne. Amongst the foremost figures of the association with which she thus became surrounded was the young Roger de Mortimer, a powerful baron, who had made his escape from England after having been condemned, for taking part in the former confederacy against the Despençers, to imprisonment for life. There is no doubt that the connection between Isabella and Roger de Mortimer became eventually a criminal one. The plot against the king was begun by the conspirators contriving to get the heir-apparent, Prince Edward, into their power. It was arranged that King Charles should restore Guienne upon receiving from the prince the homage which his father had refused to render. On this Prince Edward, now in his thirteenth year, was sent over to France to his mother. The first use Isabella made of this important acquisition was to affiancé the boy to Philippa, the daughter of the Earl of Hainault, who in return agreed to assist her and the confederates with troops and money. Thus supported, she set sail from Dort with a force of 3000 men, under the command of the earl's brother, and landed at Orwell in Suffolk, the 22nd of September 1326. She was immediately joined by all the most distinguished persons in the kingdom, including even the Earl of Kent, the king's own brother. Edward, deserted by all except the two Despençers and a few of their creatures, left London, and took refuge at first in Bristol: he then embarked for Ireland, or, as another account says, with the design of making for the small isle of Lundy, at the mouth of the Bristol Channel; but being driven back by contrary winds, he landed again in Wales, and shut himself up in Neath Abbey, in Glamorganshire. Meanwhile the queen's forces attacked the castle of Bristol, where the elder Despencer, styled Earl of Winchester, had been left governor by the king. When the siege had lasted only a few days, the garrison rose in mutiny and delivered up the old man; he was ninety years of age; but his grey hairs did not save him; he was immediately executed with every circumstance of barbarous insult the ingenuity of his captors could devise. The next day (26th of October) the prelates and barons in the queen's camp declared Prince Edward guardian of the kingdom. The king was discovered in his place of concealment about three weeks after, and was conducted in custody first to the castle of Monmouth, and then to that of Kenilworth. The younger Despencer was also taken; he was hanged and quartered at Hereford on the 24th of November. The parliament assembled on the 1st of January 1327; and after going through some forms of negotiation with the imprisoned king, it was resolved on the 25th of that month, that the crown should be taken from him and conferred upon his son Prince Edward. A deputation announced this resolution to the deposed monarch. He remained for some months longer at Kenilworth: he was then transferred successively to Corfe, Bristol, and Berkeley Castles. At length when it was found that mere insult would not kill him, he was, on the night of the 20th of September, murdered in the last-mentioned place by his keepers Sir Thomas Gournay and Sir John Maltravers.

Edward II. left by his queen, Isabella of France, two sons, Edward, who succeeded him, and John, born at Eltham, 15th of August 1316, created Earl of Cornwall, in 1327, who died at Perth in October 1336; and two daughters, Joanna, married 12th July, 1328, to Prince David, eldest son of Robert Bruce, afterwards King David II. of Scotland, and Eleanor, who became the wife of Reginald Count of Guelders.

Some attempts have been made in modern times to dispute the justice of the character which has been generally given of this king, and to throw the blame of the civil distractions which rendered his reign so unhappy and so ignominious a one, rather upon his turbulent nobility than himself. Hume has written the history of the reign with a studied endeavour to put the barons in the wrong throughout, and to represent Edward as the victim, not of his own weakness and vices, but rather of the barbarism of the age. The facts however on which the common verdict rests cannot be thus explained away. It may be admitted that among the motives which excited and sustained the several confederacies against the king, and in the conduct of some of those who took the lead in them, there was violence and want of principle enough; it is of the nature of things that the baser passions should mix themselves up and even act an important part in all such conflicts, however righteous in their origin and general object; but nothing that can be alleged on this head can affect the question of Edward's unfitness to wear the crown. That question must be considered as settled, if not by the course of outrage against all decency manifested by his conduct in the matter of Gaveston, certainly by his

relapse into the same fatal fatuity a few years after, when he fell into the hands of his second favourite Despencer.

To the reign of Edward II. belongs the memorable event of the suppression in England, as in the other countries of Europe, of the great order of the Knights-Templars. Their property was seized all over England in 1308; but the suppression of the order in this country was not accompanied by any of that cruel treatment of the persons of the members which they had experienced in France. In 1324 the lands which had belonged to the Templars were bestowed upon the order of St. John of Jerusalem.

The most important legal innovation of this reign was that made by the statute of sheriffs (9 Edward II., st. 2), by which the right of appointing those officers was taken from the people and committed to the chancellor, the treasurer, and the judges. Several of the royal prerogatives, relating principally to tenures, were also defined by the statute entitled 'Prerogativa Regis' (17 Edward II., st. 1). The statutes down to the end of the reign of Edward II. are commonly distinguished as the 'Vetere Statuta.' Pleading now began to assume a scientific form. The series of year-books, or reports by authority of adjudged cases, is nearly perfect from the commencement of this reign. The only law treatise belonging, or supposed to belong, to the reign of Edward II. is Horne's 'Miroir des Justices.'

The circumstances of the reign were as little favourable to literature as to commerce and the arts. Warton observes that though much poetry now began to be written, he has found only one English poet of the period whose name has descended to posterity; Adam Davy or Davis, the author of various poems of a religious cast, which have never been printed. Among these however is not to be reckoned the long work entitled 'The Life of Alexander,' which is erroneously attributed to him by Warton, but which has since been conclusively shown not to be his. There is still extant a curious Latin poem on the battle of Bannockburn, written in rhyming hexameters by Robert Baston, a Carmelite friar, whom Edward carried along with him to celebrate his anticipated victory, but who, being taken prisoner, was compelled by the Scotch to sing the defeat of his countrymen in this jingling effusion. Bale speaks of this Baston as a writer of tragedies and comedies, some of which appear to have been English; but none of them are now known to exist.

EDWARD III., King of England, the eldest son of Edward II. and Isabella of France, was born at Windsor (whence he took his surname) on the 13th of November 1312. In the first negotiations with the court of France after the breaking out of the quarrel about Guienne in 1324, a proposal seems to have been made by the French king, Charles IV., for a marriage between a daughter of his uncle, the Count de Valois, and the young Prince of Wales, as Edward was styled; but it was coolly received by the king of England, and ended in nothing. In September of the year following Prince Edward proceeded to Paris, where his mother then was, and did homage to his uncle, King Charles, for the duchy of Guienne and the earldom of Ponthieu, which his father had previously resigned to him. He was induced by his mother to remain with her at the French court, notwithstanding the most pressing letters from his father (Rymer, iv.), begging and commanding him to return. Meanwhile Isabella, having previously solicited from the pope a dispensation (which however she did not obtain), to permit her to marry her son without his father's knowledge, had arranged a compact with William earl of Hainault, by which the prince was affianced to Philippa, the second of the earl's four daughters. Edward was soon after carried by his mother to Valenciennes, the residence of the Earl of Hainault, where he met Philippa, and it is said fell ardently in love with her. He landed with his mother in England in September 1326, was declared guardian or regent of the kingdom about a month after, and was proclaimed king on the deposition of his father, January 25th, 1327. [EDWARD II.] He was crowned at Westminster the following day.

The government of the kingdom during the king's minority was placed by the parliament in the hands of a regency consisting of twelve noblemen and bishops, with Henry earl of Lancaster (the brother of Thomas, executed in the preceding reign) at their head. The queen however and Mortimer (now created Earl of March) from the first assumed the chief management of affairs, and soon monopolised all power. They must be considered as having been the real authors of the murder of the deposed king. Their authority seemed for the moment to be rather strengthened than otherwise by the failure of a confederacy formed among the nobility to effect their overthrow in the winter of 1328-29. In March 1329 signal proof was given of their determination and daring in the maintenance of their position by the fate of the king's uncle, the Earl of Kent, who having become involved in what was construed to be a plot against the government, was put to death on that charge.

Meanwhile the king, young as he was, and although thus excluded from the government, had not passed his time in inactivity. He was married to Philippa of Hainault on the 24th of January 1328. A few months after his accession he had marched at the head of a numerous army against the Scots, who had again invaded and ravaged the northern counties; but they eluded all his attempts to come up with them, and after a campaign of three weeks this expedition ended in nothing. Soon after this a treaty of peace was concluded between the two kingdoms, on the basis of the recognition of the complete

independence of Scotland. This important treaty was signed at Edinburgh on the 17th of March 1328, and confirmed in a parliament held at Northampton on the 4th of May following. One of the articles was, that a marriage should take place between Prince David, the only son of the king of Scotland, and the sister of the king of England, the Princess Joanna; and, although the bride was only in her seventh, and the bridegroom in his fifth year, the marriage was celebrated accordingly at Berwick on the 12th of July. The illustrious Bruce just lived to see this truly epic consummation of his heroic labours. He was able to receive the youthful pair on their arrival at Edinburgh after the nuptials; but he was now worn out by a disease which had for some time preyed upon him, and he expired in the following June.

The settlement of the dispute between the two countries which thus seemed to be effected, proved of very short duration. In a few months a concurrence of important events altogether changed both the domestic condition and the external relations of England. In the close of the year 1330, Edward at length determined to make a bold effort to throw off the government of Mortimer. The necessary arrangements having been made, the earl and the queen-mother were seized in the castle of Nottingham on the 19th of October; the execution of Mortimer followed at London on the 29th of November; many of his adherents were also put to death; Isabella was placed in confinement in her house at Risings (where she was detained for the remaining twenty-seven years of her life); and the king took the government into his own hands. In the course of the following year Edward seems to have formed the design of resuming the grand project of his father and his grandfather—the conquest of Scotland. For this design he found an instrument in Edward Balliol, the son of the late King John, who, in April 1332, landed with a small force at Kinghorn, in Fife, and succeeded so far, in the disorganised state of the Scottish kingdom under the incompetent regency of the Earl of Mar, and by the suddenness and unexpectedness of his attack, as to get himself crowned at Scone on the 24th of September. Edward, on this, immediately came to York; and on the 23rd of November Balliol met him at Roxburgh, and there made a solemn surrender to him of the liberties of Scotland, and acknowledged him as his liege lord. The violation of his late solemn engagements committed by Edward in this affair was rendered still more dishonourable by the caution and elaborate duplicity with which he had masked his design. Only a few weeks after doing his homage, Balliol found himself obliged to fly from his kingdom; he took refuge in England; various military operations followed; but at last Edward advanced into Scotland at the head of a numerous army. On the 19th of July 1333, a great defeat was sustained by the Scotch at the battle of Halidon Hill, near Berwick; the regent Douglas himself was mortally wounded and taken prisoner; and everything was once more subjected to Edward Balliol. King David and his queen were conveyed in safety to France. On the 12th of June 1334, at Newcastle, Balliol, by a solemn instrument, made an absolute surrender to Edward of the greater part of Scotland to the south of the Forth. But within three or four months Balliol was again compelled to take flight to England. Two invasions of Scotland by Edward followed; the first in November of this year; the second in July 1335; in the course of which he wasted the country with fire and sword almost to its extreme northern confines, but did not succeed in bringing about an engagement with the native forces, which notwithstanding still kept the field. In the summer of 1336 he took his devastating course for the third time through the northern counties, with as little permanent effect. On now retiring to England he left the command to his brother John, styled earl of Cornwall, who soon after died at Perth.

From this time however the efforts of the English king were in great part drawn off from Scotland by a new object. This was the claim which he had first advanced some years before to the crown of France, but which he only now proceeded seriously to prosecute, determined probably by the more open manner in which the French king had lately begun to exert himself in favour of the Scots, whom, after repeated endeavours to serve them by mediation and intercession, he had at length ventured to assist by supplies of money and warlike stores. Charles IV. of France had died in February 1328, leaving a daughter who was acknowledged on all hands to have no claim to the crown, which it was agreed did not descend to females. In these circumstances Philip of Valois mounted the throne, taking the title of Philip VI. He was without dispute the next in the line of the succession if both females and the descendants of females were to be excluded. Edward's claim rested on the position that although his mother, Isabella, as a female, was herself excluded, he, as her son, was not. If this position had been assented to he would undoubtedly have had a better claim than Philip, who was only descended from the younger brother of Isabella's father. But the principle assumed was, we believe, altogether new and unheard of—and would besides, if it had been admitted, have excluded both Philip and Edward, seeing that the true heir in that case would have been the son of Joanna Countess d'Evreux, who was the daughter of Louis X., Isabella's brother. It would also have followed that the two last kings, Philip V. and Charles IV., must have been usurpers as well as Philip VI.; the son of Joanna, the daughter of their predecessor and elder brother, would, upon the scheme of succession alleged by the

king of England, have come in before both. Undeterred by these considerations however, or even by the circumstance that he had himself in the first instance acknowledged Philip's title, and even done homage to him for the Duchy of Guienne, Edward, having first entered into alliance with the Earl of Brabant, and taken other measures with the view of supporting his pretensions, made an open declaration of them, and prepared to vindicate them by the sword. The earliest formal announcement of his determination to enforce his claim appears to have been made in a commission which he gave to the Earl of Brabant and others to demand the crown of France and to take possession of it in his name, dated 7th of October 1337.

We cannot here pursue in detail the progress of the long war that followed. Edward embarked for the continent on the 16th of July 1338, and arrived at Antwerp on the 22nd. Of his allies the chief were the emperor and the free towns of Flanders, under nominal subjection to their earl, but at this time actually governed by the celebrated James Van Artevelde. The emperor made him his vicar, and at Artevelde's suggestion he assumed the title of King of France. The first important action that took place was the sea-fight off Sluys, on the 22nd of June 1340, in which the English were completely victorious. It was followed by long truces, which protracted the contest without any decisive events. Meanwhile in Scotland the war proceeded, also with occasional intermissions, but on the whole to the advantage of the national cause. Balliol left the country about the close of 1338; and in May 1341 King David and his consort Joanna returned from France. In 1342 the Scots even made several incursions into the northern counties of England. A suspension of hostilities however took place soon after this, which lasted till the close of 1344.

In 1345 Edward lost the services of his efficient ally Van Artevelde, who was murdered in an insurrection of the populace of Ghent, excited by an attempt, which he appears to have made somewhat too precipitately, to induce the free towns to cast off their sovereign, the Earl of Flanders, and to place themselves under the dominion of the son of the king of England, Edward, prince of Wales. Edward, afterwards so distinguished under the name of the Black Prince (given to him from the colour of his armour), was born at Woodstock, 15th of June 1330, and was consequently only yet in his sixteenth year. His father nevertheless took him along with him to win his spurs, when in July 1346 he set out on another expedition to France with the greatest army he had yet raised. After reducing Caen and Lower Normandy, he proceeded along the left bank of the Seine till he reached the suburbs of the capital, and burnt the villages of St. Germain and St. Cloud. The memorable battle of Crecy followed on the 26th of August, in which the main division of the English army was commanded by the prince. Between 30,000 and 40,000 of the French are said to have been slain in this terrible defeat. Among those who fell was John of Luxemburg, king of Bohemia; he fell by the hand of Prince Edward, who thence assumed his armorial ensign of three ostrich feathers and the motto *Ich Dien* ('I serve'), and transmitted the badge to all succeeding princes of Wales.

The defeat of the French at Crecy was followed on the 17th of October, in the same year, by the equally signal defeat of the Scots at the battle of Nevil's Cross, near Durham, in which the greater part of the nobility of Scotland were either taken prisoners or slain, and the king himself, after being wounded, fell into the hands of the enemy. Froissart says that Queen Philippa led the English army into the field on this occasion; but no native contemporary or very ancient writer mentions this remarkable circumstance.

Three days after the battle of Crecy, Edward sat down before the town of Calais. It did not however open its gates to him till after a noble defence of nearly eleven months. On its surrender the English king was prevented, by the intercession of Queen Philippa, from making his name infamous by taking the lives of the six burgesses whom he commanded to be given up to his mercy as the price for which he consented to spare their fellow-citizens. The reduction of Calais was followed by a truce with France, which lasted till 1355. When the war was renewed, Philip VI. had been dead for five years, and the throne was occupied by his son John. On the 19th of September 1356 the Black Prince gained the battle of Poitiers, at which the French king was taken prisoner. The kings both of France and Scotland were now in Edward's hands, but neither country was yet subjugated. At last, after many negotiations, David II. was released, in November 1357, for a ransom of 100,000*l.*, to be discharged in ten yearly payments. King John was released on his parole in 1360, when a treaty of peace was concluded between the two countries at Bretigny, confirming to the English the possession of all their recent conquests. But after remaining in France for about four years, John returned to captivity on finding that he could not comply with the conditions on which he had received his liberty, and died in London, 8th of April, 1364. He was succeeded by his son, Charles V., who had acted as lieutenant of the kingdom during his absence.

It would appear that during the Scottish king's long detention in England he had been prevailed upon to come into the views of Edward, at least to the extent of consenting to sacrifice the independence of his country after his own death; and it is probable that it was only upon a secret compact to this effect that he obtained his liberty. Joanna, the consort of David, died childless in 1362; and in a parliament held at Soons the following year the king astounded the estates by proposing

that they should choose Lionel, duke of Clarence, the third son of the king of England, to fill the throne in the event of his death without issue. At this time the next heir to the throne in the regular line of the succession was the Stewart of Scotland, the son of David's elder sister Marjory; and a wish to exclude his nephew, against whom he entertained strong feelings of dislike, is supposed to have had a considerable share in influencing the conduct of the king. The proposal was rejected by the parliament unanimously and with indignation. A few months after this the death of Edward Balliol without issue removed all chance of any competitor arising to contest David's own rights, and he became of course a personage of more importance than ever to the purposes of the ambitious and wily king of England. David now repaired to London; and here it was agreed in a secret conference held between the two kings on the 23rd of November, that in default of the king of Scots and his issue male, the king of England for the time being should succeed to the crown of Scotland. In the meantime the king of Scots was to sound the inclinations of his people, and to inform the English king and his council of the result. (See the articles of the agreement, twenty-eight in number, in the sixth volume of Rymer's *Fœdera*.) From this time David acted with little disguise in the interests of the English king, and even spent as much of his time as he could in England. One effect of this policy was, that actual hostilities between the two countries ceased; but no public misery could exceed that of Scotland, distracted as it was by internal convulsions, exhausted by the sufferings and exertions of many preceding years, and vexed by the exactions necessary to defray the ransom of the king, his claim to which Edward artfully took advantage of as a pretext for many insults and injuries, and a cover for all sorts of intrigues. In 1365 however it was agreed that the truce (for the cessation from hostilities was as yet nothing more) should be prolonged till 1371.

In 1361 the Prince of Wales had married Joanna, styled the Fair, the daughter of his great uncle the Earl of Kent, who had been put to death in the beginning of the present reign. This lady had been first married to William de Montacute, earl of Salisbury, from whom she had been divorced; and she had now been about three months the widow of Sir Thomas Holland, who assumed in her right the title of Earl of Kent, and was summoned to parliament as such. Soon after his marriage the Prince of Wales was raised by his father to the new dignity of Prince of Aquitaine and Gascony (the two provinces or districts of Guienne); and in 1363 he took up his residence, and established a splendid court in that quality, at Bordeaux. Edward's administration of his continental principality was very able and successful, till he unfortunately became involved in the contest carried on by Pedro, surnamed the Cruel, with his illegitimate brother, Henry of Trastamare, for the crown of Castile. Pedro having been driven from his throne by Henry, applied to the Black Prince for aid to expel the usurper. At this call Edward, forgetting everything except the martial feelings of the age, and what he conceived to be the rights of legitimacy, marched into Spain, and defeated Henry at the battle of Najera, fought on the 3rd of April 1367. He did not however attain even his immediate object by this success. Pedro had reigned little more than a year when he was again driven from his throne by Henry, by whom he was soon after murdered. Henry kept possession of the throne which he had thus obtained till his death, ten years after. Prince Edward meanwhile, owing to Pedro's misfortunes, having been disappointed of the money which that king had engaged to supply, found himself obliged to lay additional taxes upon his subjects of Guienne, to obtain the means of paying his troops. These imposts several of the Gascon lords refused to submit to, and appealed to the king of France as the lord paramount. Charles on this summoned Edward to appear before the parliament of Paris as his vassal; and on the refusal of the prince, immediately confiscated all the lands held by him and his father in France. A new war forthwith broke out between the two countries. For a time the wonted valour of Prince Edward again shone forth; but among the other fruits of his Spanish expedition was an illness caught by his exposure in that climate, which gradually undermined his constitution, and at length compelled him, in January 1371, to return to England. He had just before this lost his eldest son, Edward, a child of six years old. King Edward's consort, Queen Philippa, had died on the 15th of August 1369.

On his departure from Guienne, Prince Edward left the government of the principality in the hands of his brother John of Gaunt, duke of Lancaster. The duke shortly after married a daughter of Pedro the Cruel, in whose right he assumed the title of King of Castile, and before the end of the year followed his brother to England. Affairs on the continent now went rapidly from bad to worse. The great French general, Duguesclin, drove the English everywhere before him. In the summer of 1372 two expeditions were fitted out from England, the first commanded by the Earl of Pembroke, the second by King Edward in person, accompanied by the Black Prince; but both completely failed. The forces of the Earl of Pembroke were defeated while attempting to land at Rochelle by the fleet of Henry, king of Castile; and those conducted by the king and his son, which were embarked in 400 ships, after being at sea for six weeks, were prevented from landing by contrary winds, and obliged to put back to England. At last, in 1374, when he had lost everything that had been secured to

him by the treaty of Bretigny, Edward was glad to conclude a truce for three years.

Thus ended the French wars of this king, which had cost England so much blood and treasure. Those which he waged against Scotland equally failed of their object. David II. had died in February 1371, and the Stewart of Scotland immediately ascended the throne without opposition under the title of Robert II. No serious attempt was ever made by Edward to disturb this settlement, though he at one time seemed inclined to threaten another Scottish war, and he never would give Robert the title of king; he contented himself with styling him "the most noble and potent prince, our dear cousin of Scotland."

The latter years of Edward's long reign presented in all respects a melancholy contrast to its brilliant commencement. The harmony which had hitherto prevailed between the king and his parliament gave way under the public misfortunes, and the opposition to the king's government was headed by his eldest son. The Black Prince however died in his forty-sixth year, on the 8th of June 1376. He was in the popular estimation the first hero of the age, and to this reputation his military skill, his valour, and other brilliant and noble qualities, may be admitted to have entitled him; but, with all his merits, he was not superior to his age, nor without his share of some of the worst of its faults. He left by his wife Joanna one son, Richard, a child in his tenth year; and he appears also to have had a daughter, who became the wife of Waleran de Luxemburg, count de Ligny: his illegitimate sons were Sir John Sounder and Sir Roger de Clarendon. King Edward, in the weakness of old age, had now for some time given up the entire management of affairs to his second son, the unpopular Duke of Lancaster, and fears were entertained that he intended the duke to inherit the crown; but these apprehensions were removed by his creating Richard of Bordeaux Prince of Wales, Duke of Cornwall, and Earl of Chester, and declaring him in parliament his heir and successor. Since the death of his queen also he had attached himself with doting fondness to Alice Perers, one of the ladies of her bed-chamber, and had excited great public disgust by the excesses to which this folly carried him. The last fortnight of his life he spent at his manor of Shene, now Richmond, attended only by this lady. But even she deserted him on the morning of his death; and no one, it is asserted, save a single priest, was by his bed-side, or even in the house, when he breathed his last. This event happened on the 21st of June 1377, in the sixty-fifth year of his age and the fifty-first of his reign.

Edward III. had by his queen, Philippa of Hainault, seven sons: 1, Edward prince of Wales; 2, William of Hatfield, born 1336, who died young; 3, Lionel, duke of Clarence, born at Antwerp 29th of November 1338; 4, John, duke of Lancaster, called of Gaunt, or Ghent, where he was born in 1340; 5, Edmund, duke of York, born at Langley, near St. Alban's, in 1341; 6, William, born at Windsor, who died young; 7, Thomas, duke of Gloucester, born at Woodstock 7th of January 1355; and five daughters: 1, Isabella, married to Ingelram de Courcy, earl of Soissons and Bedford; 2, Joanna, born in August 1354, who was contracted, in 1345, to Pedro the Cruel, afterwards king of Castile, but died of the plague at Bordeaux, in 1349, before being married; 3, Blanche, called De la Tour, from having been born in the Tower of London, who died in infancy; 4, Mary, married to John de Montford, duke of Bretagne; and 5, Margaret, married to John de Hastings, earl of Pembroke.

It has been observed, in regard to Edward III., by Sir James Mackintosh, that "though his victories left few lasting acquisitions, yet they surrounded the name of his country with a lustre which produced strength and safety; which perhaps also gave a loftier tone to the feelings of England, and a more vigorous activity to her faculties." "During a reign of fifty years," it is added, "Edward III. issued writs of summons, which are extant to this day, to assemble seventy parliaments or great councils: he thus engaged the pride and passions of the parliament and the people so deeply in support of his projects of aggrandisement, that they became his zealous and enthusiastic followers. His ambition was caught by the nation, and men of the humblest station became proud of his brilliant victories. To form and keep up this state of public temper was the mainspring of his domestic administration, and satisfactorily explains the internal tranquillity of England during the forty years of his effective reign. It was the natural consequence of so long and watchful a pursuit of popularity that most grievances were redressed as soon as felt, that parliamentary authority was yearly strengthened by exercise, and that the minds of the turbulent barons were exclusively turned towards a share in their sovereign's glory. - Quiet at home was partly the fruit of fame abroad."

The two great charters were repeatedly confirmed in this reign, and a greater number of important new laws were passed than in all the preceding reigns since the Conquest. Among them may be particularly noticed the celebrated statute (25 Ed. III., st. 5, c. 2) defining and limiting the offence of high treason; the numerous provisions made to regulate the royal prerogative of purveyance, and diminish the grievances occasioned by it; the law (1 Ed. III., c. 12) permitting tenants in chief to alienate their lands on payment of a reasonable fine; the several prohibitions against the payment of Peter's Pence; and the first statute (the 27th Ed. III., st. 1, c. 1) giving a writ of *præmunire* against such as should presume to cite any of the king's subjects to the court of Rome. In this reign also began the legisla-

tion respecting the poor, by the enactment of the statute of Labourers (23 Ed. III., c. 1), which was followed by several other acts of the same kind, setting a price upon labour as well as upon provisions. Trial by Jury also now began to acquire a decided ascendancy over the old modes of trial, and various regulations were made for improving the procedure of the courts and the administration of justice. Justices (at first called keepers) of the peace were established by the statute 34 Ed. III., c. 1. In 1362 was passed the important act (36 Ed. III., st. 5, c. 15) declaring that henceforth "all pleas should be pleaded, showed, defended, amended, debated, and judged in the English tongue," and no longer in the French, which is described as "much unknown in the realm." They were ordered still however to be entered and enrolled in Latin. The acts of parliament continued to be written sometimes in Latin, but most generally in French, long after this time. The science of legal pleading is considered by Coke to have been brought to perfection in this reign. The only law treatises which belong to this reign are those entitled the 'Old Tenures,' the 'Old Natura Brevium,' the 'Nova Narrationes,' and the book on the 'Diversity of Courts.' They are all in Norman French.

The commerce and manufactures of the country made some advances with the general progress of the age in the course of this reign; but they certainly were not considerable for so long a space of time. The woollen manufacture was introduced from the Netherlands, and firmly rooted in England before the close of the reign. Some augmentation also seems to have taken place in the shipping and exports of the country. On the other hand, the king's incessant wars operated in various ways to the discouragement of commerce. Sometimes foreign merchants were afraid to send their vessels to sea lest they should be captured by some of the belligerents. On one occasion at least (in 1336), Edward made a general seizure of the property belonging to foreign merchants within his dominions, to supply his necessities. At other times he resorted to the ruinous expedient of debasing the coin. Many acts were passed by the parliament on the subject of trade, but they involved for the most part the falsest principles; some prohibiting the exportation of money, of wool, and of other articles; others imposing penalties for forestalling; others attempting to regulate wages, prices, and expenditure. Of course such laws could not be executed; they only tormented the people, and aggravated the mischiefs they were intended to cure; but in consequence of being thus inefficient, they were constantly renewed. The most memorable invention of this age is that of gunpowder, or rather its application in war. It has been asserted that cannons were used at the battle of Crecy in 1346; and there is reason to believe that they were in use about twenty years earlier. They were certainly familiarly known before the close of the reign.

Among the more elegant arts, architecture was that which was carried to the greatest height. Edward III. nearly rebuilt the castle of Windsor, which however has undergone great improvements and alterations since his time; the chapel of St. George, built by this king, was reconstructed by Edward IV. Splendour and luxury generally made undoubtedly great advances among the wealthier classes, although it may be questioned if wealth was more generally diffused throughout the community, or if the poverty and wretchedness of the great body of the people were not rather increased than diminished. The increase of licentiousness of manners among the higher ranks appears to have kept pace with that of magnificence in their mode of living. This was the age of tournaments, and of the most complete ascendancy of the system of chivalry. The Order of the Garter was instituted by Edward III., it is generally supposed in the year 1349.

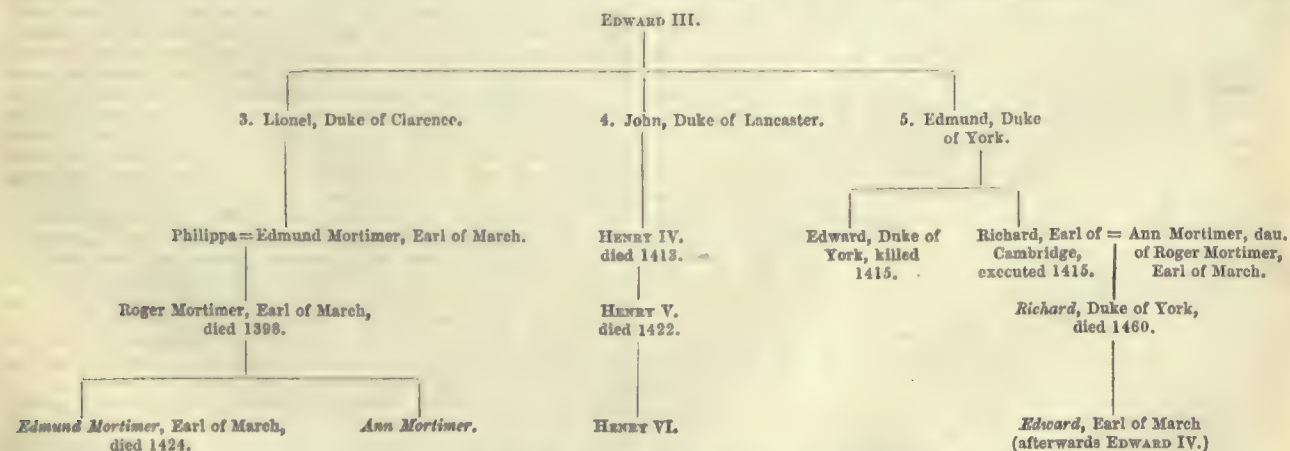

In literature, this was the age of Chaucer, the Morning Star of our poetry, and of his friend Gower, and also of Wicliffe, who first translated the Scriptures into English, and who has been called the Morning Star of the Reformation. The principal chroniclers of the time of Edward III. are Thomas Stubbs, William Thorn, Ralph Higden, Adam Merimuth, Henry de Knighton, and Robert de Avesbury.

The convulsion in the church, excited by Wicliffe, began in the last years of Edward III., but the history of it more properly belongs to the next reign, that of his grandson Richard II.

EDWARD IV., King of England. During the reign of Richard II. the heir presumptive to the crown was Roger Mortimer, earl of March, the son of Philippa Plantagenet, who was the only child of Lionel, duke of Clarence, the second of the sons of Edward III. that left any descendants. Roger, earl of March, died in Ireland, where he was lord-lieutenant, or governor, in 1398. His son, Edmund Mortimer, earl of March, was a child of only ten years of age at the deposition of Richard II. in 1399; but in his person resided the right to the crown by lineal descent so long as he lived. Although however his name was mentioned on several occasions in connection with his dangerous pretensions, and he more than once ran the risk of being made a tool of in the hands of persons more ambitious than himself, he never made any attempt against the house of Lancaster. We may here remark that much confusion has been introduced into the common accounts of Edmund Mortimer by his being confounded with his uncle Sir Edmund Mortimer. It was the latter personage, for instance, who, having married the daughter of Owen Glendower, engaged with the Percies in their insurrection in 1403, and performed the rest of the part assigned to the Lord Mortimer in Shakspeare's

play of the First Part of 'Henry the Fourth.' It is to him also we suppose that we are to attribute the pun put by the common histories into the mouth of his nephew the Earl of March at the coronation of Henry IV., when, on that king claiming the crown as the heir male of Henry III., he said that he was indeed *Heres Malus*. The young Earl of March, with the other children of his father, was detained in a sort of imprisonment at Windsor during all the reign of Henry IV., but on the accession of Henry V. he was set at liberty. In 1415 he became involved in the conspiracy planned against Henry V. by Richard, earl of Cambridge; but it is most probable that he was not answerable for the use which was made, or rather intended to be made, on this occasion, of his name. Indeed the common account makes him to have been the person who gave Henry information of the conspiracy, after he had been applied to by the Earl of Cambridge, who had married his sister, to join it. After the accession of Henry VI. he was sent as lord lieutenant to Ireland; and he died there, in the castle of Trim, in 1424. He left no issue, nor did his brother Roger, nor his sister Eleanor; but his sister Ann, married to the Earl of Cambridge, had a son named Richard, who consequently became his uncle's representative, and (at least after the death of his mother) the individual on whom had devolved the claim by lineal descent to the crown. This Richard was also the representative of Edward III.'s fifth son, Edmund, duke of York, his father, the Earl of Cambridge, having been the second son of that prince, whose eldest son and heir, Edward, duke of York, had fallen at the battle of Agincourt, leaving no issue, only a few months after his brother had been executed for the conspiracy mentioned above. At the time of his uncle's death, Richard, in consequence of his father's forfeiture, had no title; but he seems to have immediately assumed that of Earl of March, at least he is so called by some of the chroniclers, and the same title was also afterwards borne by his son, although the right of either to it may be questioned, inasmuch as it appears to have been only descendible to heirs male. Richard however is best known by his title of Duke of York, which he took in 1425, on being restored in blood and allowed to inherit the honours both of his father and uncle. But it is important to recollect that the claim of the house of York to the crown in opposition to the house of Lancaster was not derived from Edward III.'s fifth son, Edmund, duke of York, who was younger than John of Gaunt, the founder of the house of Lancaster, but from Lionel, duke of Clarence, who was that king's third son, John of Gaunt being his fourth.

As a clear notion of the above genealogical statement is important to the understanding of a considerable portion of English history, it may be proper once for all to exhibit it in the form most convenient for its ready apprehension and for future reference to it. The line of the eldest son of Edward III. having failed in Richard II., and his second son having died without issue, the contest for the crown in the 15th century lay among the descendants of his third, fourth, and fifth sons, whose connection with him and among themselves stood thus:—

The persons whose names are printed in Italics are those in whom successively the hereditary right vested. We cannot discover however how long Ann Mortimer survived her brother, or even that she survived him at all, although it seems to be usually assumed that she did.

Richard, duke of York, first makes his appearance in public affairs in the end of the year 1435, when he was appointed by Henry VI. to the regency of France on the death of the Duke of Bedford. By the time he entered upon his office however Paris had been evacuated, and their French dominion was fast passing out of the hands of the English. He was recalled in 1437, but was reappointed on the death of his successor, the Earl of Warwick, in July 1440. On the 29th of April 1441 (or, according to another account, in September 1442), his son Edward, earl of March, afterwards Edward IV., was born at Rouen. The Duke of York remained in France till after the conclusion of the king's marriage with Margaret of Anjou, in 1446; and his government was then prolonged for another term of five years;

but in 1447 he was recalled, through the influence of the queen and the favourite, the Marquis of Suffolk, and Edmund Beaufort, earl (afterwards duke) of Somerset, the chief of the younger branch of the Lancaster family, was appointed his successor. It is understood that before this the unpopular government of the queen and the favourite had turned men's minds to the claims of the Duke of York; and it is said that he himself, though he moved warily in the matter, was not idle by his emissaries in encouraging the disposition that began to grow up in his favour. The progress of events in course of time enabled him to take a bolder part in the promotion of the design he had already in all probability formed, of securing the crown for himself and his family. In 1449 he gained additional popularity by the able and conciliatory manner in which he suppressed an insurrection in Ireland. In the rising of the people of Kent the next year, their leader, Jack Cade, assumed the name of Mortimer as a sort of title. When he rode in triumph through the streets of the metropolis, he called out, as he struck London Stone with his sword, "Now is Mortimer lord of the city!" When the duke returned from Ireland, in August 1451, some steps seem to have been taken by the court to oppose his landing; but he made his way to London, and immediately entered there into consultations with his friends. It was determined to demand the dismissal and punishment of the Duke of Somerset, now the king's chief minister; but although this attempt was supported by an armed demonstration, it ended after a few months in the Duke of York dismissing his followers, returning to his allegiance, and agreeing to retire to his estate.

The king had now been married for several years without having any children, and it appears to have been generally expected that the duke, by merely waiting for his death, would obtain the crown without any risk or trouble. On the birth of the Prince of Wales however in October 1453, it became necessary to adopt another course. The spirit that showed itself in the parliament the following year forced the court to admit the Duke of York and his chief friends and confederates, the two Nevilles (father and son), earls of Salisbury and Warwick, into the council, where their first act was to arrest the Duke of Somerset and send him to the Tower. A few weeks after this (on the 3rd of April 1454), the Duke of York was appointed by the parliament protector and defender of the kingdom during the illness of the king, who had fallen into a state of mental as well as bodily imbecility. In the following spring however Henry partially recovered, and resuming the management of affairs, released Somerset. This brought matters to a crisis. The Duke of York now withdrew from court, and both parties collected their forces to decide their quarrel by the sword. The two armies met at St. Albans on the 23rd of May 1455, when the king was defeated, he himself being wounded and taken prisoner, and the Duke of Somerset and others of the royal leaders slain. Henry, detained in the hands of the victor, was obliged to call a parliament, which met at Westminster on the 9th of July; and here the helpless king declared the duke and his friends to be innocent of the slaughter at St. Albans, and greeted them as his "free and

faithful liegemen." The parliament met again, after prorogation, on the 12th of November, when the duke was a second time appointed protector. He was removed however by the king on the 23rd of February 1456; on which he again retired from court with his friends. The next two years passed without any further encounter, each party hesitating to attack the other. At last in the spring of 1458, York and his friends were invited by the queen to London to be reconciled to the Lancastrian party; an agreement to live for the future in peace was made with much solemnity; and the Duke of York and the Earls of Salisbury and Warwick were again admitted into the council. All this however seems to have been merely a stratagem of the queen's to get them into her power: their danger soon became

apparent; and before the end of the year they all again withdrew from court. The resort to the final arbitrament could not now be much longer deferred. Both parties again collected their armed strength. Their first meeting took place at Blore-heath, near Drayton, in Shropshire, on the 23rd of September 1459, when the royal forces under Lord Audley were defeated by the Earl of Salisbury, Audley himself being slain. On the 12th of October however the king's army met that of York and Warwick near Ludlow: ample offers of pardon were made to all who would come over to the royal side; and the consequence was, that so many of the insurgents deserted, that, almost without striking a blow, the rest threw down their arms, and their leaders were obliged to save themselves by flight. The Duke of York and his adherents were attainted and their estates confiscated, at a parliament which met at Coventry a few weeks after. By June 1460 however the dispersed insurgents were again in arms. York landed from Ireland and Warwick from France nearly at the same time; the latter, whose numbers had now increased to nearly 40,000 men, entered London on the 2nd of July; and on the 9th the royal forces, advancing from Coventry, were met near Northampton, by York's son Edward, the young earl of March, and signally defeated, the king being taken prisoner, and the queen and her son obliged to fly for their lives. This is the first appearance of Edward on the scene. Up to this time also the Duke of York had never disputed Henry's title to the crown; he professed to have taken arms only to compel the king to dismiss his evil counsellors and to govern according to the laws. Even now Henry's name was still made use of by the victorious party. He was made to call a parliament, which met at Westminster on the 2nd of October, and immediately annulled everything that had been done by the late parliament of Coventry. But at this point the duke at last threw off all disguise. On the 16th he delivered to the parliament by his counsel a written claim to the crown. The question was formally discussed, and it was at length determined that Henry should be allowed to remain king during his life, but that the Duke of York should be immediately declared his successor. Richard was accordingly, on the 1st of November, solemnly proclaimed heir-apparent and protector of the realm; being in the latter capacity invested with rights and powers which already threw into his hands all of royalty except the name. But his dignity and authority were soon brought to an end. The queen found means to assemble an army in the north; on hearing which news the duke, on the 2nd of December, marched from London to give her battle. They met on Wakefield Green on the 31st, and the issue of their encounter was the complete defeat of York. He himself and one of his younger sons were slain, and the Earl of Salisbury was taken prisoner, and executed the next day at Pomfret with twelve of his associates. Edward, now duke of York, was at Gloucester when he heard of this disaster. A formidable royal force, commanded by the Earls of Pembroke and Ormond, hung on his rear; this he attacked on the 2nd of February 1461, at Mortimer's Cross, near Hereford, and completely routed. He then set out for London, upon which the queen also was now directing her march. The next engagement that took place was at Bernard's Heath, near St. Albans, where the queen was met on the 17th by the Earl of Warwick: the earl, who had the king with him in the field, was defeated, and his majesty regained his liberty. The approach of the Duke of York however deterred Margaret from continuing her advances upon the capital; she retired to the north, while he entered London on the 28th, amid the congratulations of the citizens. On the 2nd of March he laid his claim to the crown, founded on King Henry's alleged breach of the late agreement, before an assembly of lay and clerical lords; on the same afternoon an assembly of the people was held in St. John's Fields, at which his nomination as king was received with unanimous acclamations of assent; and two days after he was solemnly proclaimed by the name of Edward IV. The 4th of March was considered as the day of his accession.

The first three years of the reign of Edward IV. were occupied by a prolongation of the contest that raged when he mounted the throne. The Lancastrians sustained a severe defeat from the king in person at Towton in Yorkshire, on the 29th of March 1461; but Queen Margaret was unwearied in her applications for assistance to France and Scotland, and she was at last enabled to take the field with a new army. That too however was routed and dispersed at Hexham by the forces of Edward under the command of Lord Montagu, on the 17th of May 1464. This victory, and the capture of Henry, which took place a few days after, put an end to the war. An event however occurred about the same time out of which new troubles soon arose. This was the marriage of the king with Elizabeth Woodville, the young and beautiful widow of Sir Thomas Gray, and the daughter of Sir Richard Woodville (afterwards created Earl Rivers) by Jacquetta of Luxembourg, whose first husband had been the late Duke of Bedford. The connections of the lady, both by her birth and by her first marriage, were all of the Lancastrian party; but Edward's passion was too violent to allow him to be stopped by this consideration; he was privately married to her at Grafton, near Stony Stratford, on the 1st of May 1464: she was publicly acknowledged as his wife in September; and she was crowned at Westminster on Ascension Day in the following year. The first effect of this marriage was to put an end to a negotiation, in which some progress had been made, with the

French King Louis XI. for Edward's marriage with his sister-in-law the Princess Bonne of Savoy, an alliance which it was hoped might have proved a bond of amity betwixt the two kingdoms. It at the same time alienated from the king the most powerful of his supporters, the Earl of Warwick, by whom the French negotiation had been conducted, and whose disapprobation of the king's conduct in a political point of view was consequently sharpened by the sense of personal ill-usage. Above all, the honours and bounties lavished by Edward upon the obscure family of his queen disgusted the old nobility, and raised even a national feeling against him. It was some time before matters came to extremities; but at last, Warwick and Queen Margaret having entered into close alliance, England was once more, in 1469, deluged with the blood of a civil war. Nearly the whole of that and the following year was a season of confusion, of which it is scarcely possible to derive any consistent or intelligible account from the imperfect documents of the time that remain, and the ill-informed chroniclers who have attempted to describe the course of occurrences. At last, in the beginning of October 1470, Edward found himself obliged to embark and fly to Holland. King Henry was now released from the Tower, in which he had been confined for the preceding six years, and the royal authority was again exercised in his name. This revolution earned for Warwick his well-known title of the King-maker. Henry's restoration however was a very short one. On the 14th of March 1471 Edward landed at the mouth of the Humber, with a force which he had raised in the Low Countries, made his way to London, was received with acclamations by the citizens, again obtained possession of the imbecile Henry, and shut him up in his old prison. He then, on the 14th of April, went out to meet Warwick, who was advancing from St. Albans: the two armies encountered at Barnet; and the result was that the forces of the earl were completely defeated, and both he and his brother Lord Montagu were left dead on the field. The war was finished by the second defeat of the Lancastrians on the 14th of May, at the great battle of Tewkesbury, where both Queen Margaret and her son Prince Edward fell into the hands of their enemies. Margaret was sent to the Tower, and was detained there till she was set at liberty in conformity with one of the articles of the treaty of Pecquigny, concluded with France in 1475, the French king paying for her a ransom of 50,000 crowns. Her unfortunate son was brought before Edward on the day after the battle, and brutally put to death in his presence by the hands of the dukes of Clarence and Gloucester (the king's brothers), assisted by two other noblemen. King Henry terminated his days in the Tower about three weeks after; and it has generally been believed that he was also violently taken off, and that his murderer was the Duke of Gloucester. Many executions of the members of the Lancastrian party followed, and confiscations of their property in all parts of the kingdom.

The remainder of the reign of Edward IV. was marked by few memorable events. One that may deserve to be noticed is the fate of the king's next brother, George, duke of Clarence, who was attainted of treason by a parliament which met in January 1478, and immediately after privately put to death, being drowned, it was generally believed, in a butt of malmsey. He had at one time taken part with Warwick against his brother, and had sealed his alliance with the earl by marrying his daughter; nor, although he afterwards saw it prudent to break this connection, had he and Edward ever probably been cordially reconciled. It seems to have been chiefly his nearness to the throne that at last fixed his brother in the determination of getting rid of him. Edward was at war both with Scotland and with France during the greater part of his reign; but the military operations that took place were unimportant, and are not worth relating: they were never carried on with any vigour, and were frequently suspended by long truces, which however, in their turn, were generally broken by the one nation or the other before the proper term. In June 1475, Edward having previously sent a herald to King Louis to summon him to surrender the whole kingdom of France, embarked with a large force, and landed at Calais; but the expedition ended within three months in the treaty of Pecquigny, or Amiens, already mentioned. By one of the articles it was agreed that the dauphin, Charles, should marry Elizabeth, the king of England's eldest daughter; and Louis also engaged to pay Edward an annuity of 50,000 crowns a year as long as they both lived. It appears that Edward's ministers as well as their royal master consented to receive pensions from the French king; large amounts of money were distributed among them from time to time; and in their case at least this foreign pay was a mere bribe to engage them in the interests of the power from which they received it. Edward however is asserted to have himself shared in their gains; indeed his own acknowledged annuity, though it might bear the appearance of a compensation for advantages which he had given up, was itself in reality nothing else than a bribe; it was a supply obtained independently of parliament and the country. He was driven indeed to many other shifts and illegal methods, as well as this, to raise money for his wasteful debaucheries and extravagant expenditure on the mistresses, favourites, and others that ministered to his personal pleasures. Louis however appears never to have had any intention of fulfilling his engagement as to the marriage; for some years he evaded Edward's importunities as well as he could; till at length, in 1482, he contracted the dauphin

in another quarter. Edward, incensed in the highest degree, was preparing to avenge this affront by a new descent upon France, in which the parliament had eagerly promised to assist him with their lives and fortunes, when he was suddenly cut off by a fever, on the 9th of April 1483, after a reign of twenty-two years.

Edward IV. had by his wife Elizabeth three sons—Edward, who succeeded him; Richard, duke of York, born in 1474; and George, duke of Bedford, who died in infancy; and seven daughters—Elizabeth, born 11th of February 1466, contracted to the dauphin, and afterwards married to Henry VII.; Cecilia, contracted to Prince James (afterwards James IV.) of Scotland, and afterwards married first to John, viscount Wells, secondly to Mr. Kyme, of Lincolnshire; Anne, contracted to Philip, son of the Archduke Maximilian of Austria and his wife the Duchess of Burgundy, and afterwards married to Thomas Howard, duke of Norfolk; Bridget, born at Eltham, 10th of November 1480, who became a nun at Dartford; Mary, contracted to John I., king of Denmark, Norway, and Sweden, but who died at Greenwich in 1482, before the marriage was solemnised; Margaret, born 19th of April 1472, who died 11th of December following; and Catherine, contracted to John, eldest son of Ferdinand and Isabella of Spain, and afterwards married to William Courtenay, earl of Devonshire. By one of his many mistresses, Elizabeth Lucy, he had two natural children—Arthur, surnamed Plantagenet, created Viscount Lisle by Henry VIII.; and Elizabeth, who became the wife of Thomas, lord Lumley.

Edward IV. has the reputation of having been zealous and impartial in the administration of justice; but with the exception of some statutes abridging the ancient jurisdiction of sheriffs, and transferring part of the powers of those officers to the quarter-sessions, no important innovations were made in the law during this reign. It is from this period however that the rise of what is called indirect pleading is dated. In this reign also the practice of suffering common recoveries by a tenant in tail, as a means of barring his estate tail, and also all the estates in remainder and reversion, was fully established by judicial decision (in the twelfth year of this king), after it had been interrupted for some time by the statute of Westminster 2, 13 Ed. I., c. 32. The reduction of the law and its practice to a scientific form is considered to have made great progress in the latter part of the reign of Henry VI. and in that of Edward IV. To the latter belong the treatise 'De Laudibus Legum Angliæ' of Sir John Fortescue, the celebrated treatise on 'Tenures' of Sir Thomas Littleton, and the work called Statham's 'Abridgment of the Law.' The Year Books also began now to be much more copious than in former reigns.

Many laws relating to trade and commerce passed in the reign of Edward IV. attest the growing consequences of those interests, but are not in other respects important, and do not show that more enlightened views began to be entertained than had heretofore prevailed. The manufacture of articles of silk, though only by the hand, was now introduced into this country; and we find the parliament endeavouring to protect it by the usual method of prohibiting the importation of similar articles made abroad. This reign is illustrious as being that in which the art of printing was introduced into England. [CAXTON.]

The testimony of historians concurs with the probabilities of the case in assuring us that the country must have been subjected to much devastation and many miseries during the bloody and destructive wars of York and Lancaster; but this contest was undoubtedly useful in shaking the iron-bound system of feudalism, and clearing away much that obstructed the establishment of a better order of things. The country seems to have very soon recovered from the immediate destruction of capital and property occasioned by these wars.

EDWARD V., the eldest son of Edward IV., was born on the 4th of November 1470, in the Sanctuary of Westminster Abbey, where his mother had taken shelter when her husband was obliged to fly to the continent on the return of Queen Margaret and the Earl of Warwick. He was consequently only in his thirteenth year when his father died. His reign is reckoned from the 9th of April 1483, the day of his father's decease; but during the few weeks it lasted he never was a king in more than name. The public transactions of his reign all belong properly to the history of his uncle, Richard III. Edward was at Ludlow in Shropshire at the time of his father's death, and possession of his person was obtained at Northampton by Richard (then Duke of Gloucester) as he was on his way to London in charge of his maternal uncle Anthony, earl Rivers. He appears not to have been brought to London till the beginning of May. In the course of that month, and probably between the 24th and 27th, Richard was declared at a great council protector of the king and the kingdom. On the 16th of June he contrived to obtain Edward's younger brother, the Duke of York, out of the hands of the queen his mother, who had taken refuge in Westminster Abbey with him and his sister. The two boys were forthwith removed to the Tower, then considered one of the royal palaces, there to remain, as was pretended, till the coronation of the young king, which was appointed to take place on the 22nd. Before that day arrived however Richard had completed his measures for placing the crown on his own head. The 26th of June is reckoned the commencement of his reign, and the close of that of his nephew. After this Edward and his brother were seen no more. They were however universally believed to have been made away with by Richard. The account which has been generally received is that given by Sir Thomas More, whose testimony may be regarded as that

of a contemporary, for he was born some years before the death of Edward IV. His statement is in substance that Richard, while on his way to pay a visit to the town of Gloucester after his coronation, sent one John Green, "whom he specially trusted," to Sir Robert Brackenbury, the constable of the Tower, with a letter desiring Sir Robert to put the children to death; that Brackenbury declared he would not commit so dangerous a deed; that Sir James Tyrrel was then despatched with a commission to receive the keys of the Tower for one night; and that under his directions the children were about midnight stifled in bed with their feather-beds and pillows, by Miles Forest, "one of the four that kept them, a fellow fleshed in murder beforetime," and John Dighton, Tyrrel's own horse-keeper, "a big, broad, square, and strong knave." The relation is given in the fullest and most particular form, not in the Latin translation of More's 'History,' or in the retranslation of that into English, published (with a strange ignorance that the work already existed in English) in Bishop Kennet's 'Collection of Histories' (3 vols. folio, 1708), but in the English work, which we believe is the original. It is printed in full from More's works in Holinshed, who describes it as written about the year 1513. More does not give the story as merely "one of the various tales he had heard concerning the death of the two princes" (Henry's 'History of Great Britain,' and Walpole's 'Historic Doubts on the Life and Reign of Richard III.'): he introduces it by saying, "I shall rehearse you the dolorous end of those babes, not after every way that I have heard, but after that way that I have so heard by such men and by such means, as methinketh it were hard but it should be true;" and he closes the narrative by repeating that it is what he had "learned of them that much knew, and little cause had to lie." It is perfectly evident that he had not himself a doubt of its truth. "Very truth it is," he says moreover, "and well known, that at such time as Sir James Tyrrel was in the Tower, for treason committed against the most famous prince, King Henry VII., both Dighton and he were examined, and confessed the murder in manner above written." The common story seems to be supported by the honours and rewards which were immediately bestowed by Richard upon Tyrrel, Brackenbury, Green, and Dighton. (See these stated in Strype's 'Notes on Sir George Buck's Life and Reign of Richard III,' book 3rd.) Symnel, or Sulford, who in the reign of Henry VII. assumed the character of Edward Plantagenet, son of George, duke of Clarence, seems to have originally intended to pass himself as Edward V. Perkin Warbeck, who appeared some years after, called himself Edward's brother, Richard, duke of York.

Buck and others, who have endeavoured to disprove King Richard's guilt, have rested much of their argument on the fact that the remains of Edward and his brother never could be found in the Tower, although much search had been made for them; but on the 17th of July 1674, in making some alterations, the labourers found covered with a heap of stones at the foot of an old pair of stairs a quantity of partially-consumed bones, which on examination appeared to be those of two boys of the ages of the two princes. They were removed by order of Charles II. to Henry VII.'s Chapel in Westminster Abbey, where the inscription placed over them recites that they appeared by undoubted indications to be those of Edward V. and his brother. ("Ossa desideratorum diu et multum quæsitæ, &c., scalarem in rudibus (scale ietæ ad scellum Turris Albæ nuper ducebant) alte defossæ, indicibus certissimis sunt reperta, &c.") This discovery is sufficiently in conformity with More's account, who tells us that Tyrrel caused the murderers to bury the bodies "at the stair foot, meetly deep in the ground under a great heap of stones." It is true he mentions a report that Richard "allowed not the burying in so vile a corner, saying that he would have them buried in a better place, because they were a king's sons; whereupon they say that a priest of Sir Robert Brackenbury's took up the bodies again, and secretly interred them in such place as, by the occasion of his death which only knew it, could never since come to light." This however is evidently a story both improbable in itself, and one which, although it might naturally enough arise and get into circulation, could never have rested on any trustworthy authority. More gives it as a mere rumour, and we may fairly infer, from the words ("as I have heard") with which it is introduced, that he did not himself believe it. He carefully adds, in his notice of the examination of Tyrrel and Dighton, "but whither the bodies were removed they could nothing tell." Tyrrel was executed for his treason; but Dighton still lived when More wrote. He says of him, "Dighton indeed yet walketh on alive, in good possibility to be hanged ere he die." According to Grafton, "Dighton lived at Calais long after, no less disdained and hated than pointed at." The reader may also compare upon this subject the account of the examinations of Tyrrel and Dighton given by Bacon in his 'History of King Henry VII.' (Montagu's edition of Bacon's Works, iii., 287, 288.) It agrees very closely with the story told by More. Bacon says that Dighton, who was set at liberty after the examinations, "was the principal means of divulging this tradition;" and from the use of that expression it has been inferred that Bacon regarded the whole as an idle tale; but he has in several places in this work distinctly expressed his belief of the guilt both of Richard and Tyrrel, especially in his notice (p. 386) of the execution of Tyrrel, "against whom," he says, "the blood of the innocent princes, Edward V. and his brother, did still cry from under the altar."

Tyrrel's examination, we may observe, appears to have taken place in 1493, but he was not executed till 1503. He was committed to the Tower in the first of these years on the appearance of Perkin Warbeck, expressly that he might be examined touching the murder; and it was on quite another charge that he was executed ten years after. More's account therefore of the circumstances of his confession is slightly inaccurate. He does not however expressly say, as Sir James Mackintosh makes him do (*'Hist. Eng.,' i. 59*), that Tyrrel "confessed his guilt when he was executed twenty years after for concealing the murder of the Earl of Suffolk." Bacon himself, who relates, in their proper places, both his first imprisonment and his execution, says, inaccurately, that he was beheaded "soon after" the examinations. [RICHARD III.]

EDWARD VI., the only son of Henry VIII. who survived him, was born at Hampton Court 12th of October 1537. His mother, queen Jane Seymour, died on the twelfth day after giving him birth. The child had three stepmothers in succession after this; but he was probably not much an object of attention with any of them. Sir John Hayward, who has written the history of his life and reign with great fulness, says that he "was brought up among nurses until he arrived to the age of six years." He was then committed to the care of Dr. (afterwards Sir Anthony) Cooke, and Mr. (afterwards Sir John) Cheke, the former of whom appears to have undertaken his instruction in philosophy and divinity, the latter in Greek and Latin. The prince made great proficiency under these able masters. Henry VIII. died at his palace at Westminster early in the morning of Friday the 28th of January 1547; but it is remarkable that no announcement of his decease appears to have been made till Monday the 31st, although the parliament met and transacted business on the intervening Saturday. Edward, who was at Hatfield when the event happened, was brought thence in the first instance to the residence of his sister Elizabeth at Enfield, and from that place, on the 31st, to the Tower at London, where he was proclaimed the same day. The council now opened the will of the late king (executed on the 30th of December preceding), by which it was found that he had (according to the powers granted him by the acts 23 Hen. VIII., ch. 7, and 35 Hen. VIII., ch. 1) appointed sixteen persons under the name of executors, to exercise the powers of the government during the minority of his son. One of these, the king's maternal uncle, Edward Seymour, earl of Hertford, was immediately elected by the rest their president, and either received from them in this character, or assumed of his own authority, the titles of governor of his majesty, lord protector of all his realms, and lieutenant-general of all his armies. He was also created Duke of Somerset, and soon after took to himself the office of lord high treasurer, and was further honoured by being made earl marshal for life. About the same time his brother, Sir Thomas Seymour, was created Baron Seymour of Sudley, and appointed lord high admiral. The elevation of Somerset had been opposed by the lord chancellor Wriothesley (now Earl of Southampton); but the protector in a few weeks got rid of his further interference by taking advantage of an informality into which the earl had fallen in the execution of his office of chancellor, and frightening him into a resignation both of the seals and of his seat in the executive council.

The period of the administration of the protector Somerset forms the first of the two parts into which the reign of Edward VI. divides itself. The character of the protector has been the subject of much controversy; but opinions have differed rather as to the general estimate that is to be formed of him, or the balance of his merits and defects, than as to the particular qualities, good and bad, by which he was distinguished. It may be said to be admitted on all hands that he was a brave and able soldier, but certainly with no pretensions in that capacity to a humanity beyond his age; that as a statesman he was averse to measures of severity, and fond of popular applause, but unstable, easily influenced by appeals either to his vanity or his fears, and without any fertility of resources, or political genius of a high order. It must be admitted also that he was both ambitious and rapacious in no ordinary degree. Add to all this, that with one of the two great parties that divided the country he had the merit, with the other the demerit, of being a patron of the new opinions in religion—and it becomes easy to understand the opposite feelings with which he was regarded in his own time, and the contradictory representations that have been given of him by party writers since.

One of the first acts of his administration was an expedition into Scotland, undertaken with the object of compelling the government of that country to fulfil the treaty entered into with Henry VIII. in 1543 for the marriage of the young Queen Mary to Edward. The Scottish forces were signally defeated by the English protector at the battle of Pinkie, fought 10th of September 1547; but the state of politics, as bearing upon his personal interests in England, compelled Somerset to hasten back to the south without securing any of the advantages of his victory. He returned to Scotland in the summer of the following year; but he wholly failed in attaining any of the objects of the war. The young queen was conveyed to France; and the ascendancy of the French or Catholic party in the Scottish government was confirmed, and continued unbroken during all the rest of the reign of Edward.

Meanwhile great changes were effected in the domestic state of England. The renunciation of the supremacy of the pope, the disso-

lution of the religious houses, and the qualified allowance of the reading of the Scriptures in English, were the principal alterations in religion that had been made up to the death of the late king. Only a few months before the close of the reign of Henry, Protestants as well as Catholics had been burned in Smithfield. Under Somerset and the new king measures were immediately taken to establish Protestantism as the religion of the state. Even before the meeting of Parliament, the practice of reading the service in English was adopted in the royal chapel, and a visitation, appointed by the council, removed the images from the churches throughout the kingdom. Bishops Gardiner of Winchester and Bonner of London, who resisted these measures, were committed to the Fleet. The parliament met in November, when bills were passed allowing the cup to the laity, giving the nomination of bishops to the king, and enacting that all processes in the ecclesiastical courts should run in the king's name. The statute of the Six Articles, commonly called the Bloody Statute, passed in 1539, was repealed, along with various other acts of the preceding reign for the regulation of religion. By the parliament of 1548 the use of the Book of Common Prayer was established, and all laws prohibiting spiritual persons to marry were declared void. At the same time an act was passed (2 and 3 Ed. VI., c. 19) abolishing the old laws against eating flesh on certain days, but still enforcing the observance of the former practice by new penalties, "the king's majesty," says the preamble, "considering that due and godly abstinence is a mean to virtue, and to subdue men's bodies to their soul and spirit, and considering also specially that fishers, and men using the trade of living by fishing in the sea, may thereby the rather be set on work, and that by eating of fish much flesh shall be saved and increased."

But Somerset's path was now crossed by a new opponent, in the person of his own brother, Lord Seymour. That nobleman, equally ambitious with the protector, but of a much more violent and unscrupulous temper, is supposed to have formed the design, very soon after the king's accession, of disputing the supreme power with his brother. It is said to have been a notice of his intrigues that suddenly recalled Somerset from Scotland after the battle of Pinkie. The crime of Seymour does not appear to have gone farther than caballing against his brother; but Somerset contrived to represent it as amounting to high treason. On this charge he was consigned to the Tower; a bill attainting him was brought into the House of Lords, and read a first time on the 25th of February 1549; it was passed unanimously on the 27th. The accused was not heard in his own defence, nor were any witnesses examined against him; the House proceeded simply on the assurance of his brother, and of other members of the council, that he was guilty. The bill was afterwards passed, with little hesitation, by the House of Commons; it received the royal assent on the 14th of March; and on the 20th Lord Seymour was beheaded on Tower-hill, with his last breath solemnly protesting his innocence.

During the summer of this year the kingdom was disturbed by formidable insurrections of the populace in Somerset, Lincoln, Kent, Essex, Suffolk, Devon, Cornwall, and especially in Norfolk, where a tanner of the name of Kett opposed the government at the head of a body of 20,000 followers. The dearth of provisions, the lowness of wages, the enclosure of common fields, and in some places the abolition of the old religion, with its monasteries where the poor used to be fed, and its numerous ceremonies and holidays that used to gladden labour with so much relaxation and amusement, were the principal topics of the popular clamour. It is worth noticing that the agency of the press was on this occasion employed, probably for the first time, as an instrument of government. Holinshed records that "while these wicked commotions and tumults, through the rage of the undisciplined commons, were thus raised in sundry parts of the realm, sundry wholesome and godly exhortations were published, to advertise them of their duty, and to lay before them their heinous offences." Among them was a tract by Sir John Cheke, entitled 'The Hurt of Sedition, how grievous it is to a Commonwealth,' which is a very able and vigorous piece of writing. It was found necessary however to call another force into operation: the insurgents were not put down without much fighting and bloodshed; and many of the rebels were executed after the suppression of the commotions. The institution of lords-lieutenants of counties arose out of these disturbances.

A few months after these events brought Somerset's domination to a close. His new enemy, John Dudley, formerly Viscount Lisle, and now Earl of Warwick, the son of that Dudley whose name is infamous in history for his oppressions in the reign of the seventh Henry, had probably been watching his opportunity, and carefully maturing his designs against the protector for a long time. It is supposed to have been through his dark and interested counsel that Somerset was chiefly impelled to take the course which he did against his brother; Warwick's object was to destroy both, and he probably counted that by the admiral's death, and the part which the protector was made to take in it, he both removed one formidable rival, and struck a fatal blow at the character and reputation of another. He himself meanwhile had been industriously accumulating popularity and power. He had greatly distinguished himself at the battle of Pinkie, and in other passages of the Scotch war; and it had been chiefly by him that the late insurrection in Norfolk had been so effectually quelled. The energy which he showed on this occasion was contrasted by the enemies of the protector with what they represented as the feebleness

of the latter, who had, they contended, encouraged the insurrection by the hesitation and reluctance which he manifested, on the first threatenings of it, to take the necessary measures for putting it down. The protector had at this time incurred considerable odium by his lavish expenditure (out of the spoils, as it was said, of the church) on his new palace of Somerset House, and certain violations both of public and of private rights, of which he was accused of having been guilty in procuring the space and the materials for that magnificent structure. A cry was also raised against him on account of a proposition he had made in the council for a peace with France on the condition of resigning Boulogne for a sum of money. In the beginning of October he learned that measures were about to be immediately taken against him. In fact Warwick and his associates in the council had collected their armed retainers, and were now ready to employ force if other means should fail. They had retired from Hampton Court, where the king resided, and fired themselves in London, where they had contrived to obtain possession of the Tower. Somerset, on the first notice of their proceedings, carried off the king to Windsor Castle, and shut himself up there as if with the intention of holding out; but he soon found himself nearly deserted by all; and after a few days the king himself was obliged to sanction the vote for his deposition passed by the majority of the council. On the 14th he was brought to London in custody, and sent to the Tower. From this moment Warwick, though without his title of protector, enjoyed his power. Somerset, reduced to insignificance by this usage, but especially by an abject submission which he made in the first moments of danger, was some time after this released from confinement, and was even allowed again to take his seat at the council-table; but he either engaged in designs to regain his lost place, or Warwick, now Duke of Northumberland, and possessed almost of undivided power in the state, felt that he should not be quite secure so long as his old rival lived. An apparent reconciliation had been effected between the two, and ratified by the marriage of Warwick's eldest son to Somerset's daughter; but this connection was no shelter to the overthrown protector: on the 1st of December 1551, he was brought to trial before the high steward and a committee of the House of Lords, on charges both of high treason and of felony; he was convicted of the latter crime, and was executed on Tower Hill, the 22nd of January 1552. He met his death with great manliness, and the popular sympathy was deeply excited in his favour, both by the feeling that, with some faults, he had fallen the victim of a much worse man than himself, and by the apprehension that in his destruction the great stay which had hitherto supported the Reformation in England was thrown down.

Warwick however (although at his death, a few years after this, he declared that he had always been a Catholic) did not feel himself strong enough to take any measures openly in favour of the ancient faith, opposed as he knew he would be in that course by the great mass of the nation. It is probable that he cared little which religion prevailed so that he remained at the head of affairs. The government accordingly continued to be conducted in all respects nearly as it had heretofore been. In March 1550 a peace had been concluded with France, one of the articles stipulating for the surrender of Boulogne, the support of which very proposition had been made the principal charge against Somerset a few months before. In the following July another treaty between the two countries was signed at Angers, by which it was agreed that the King of England should receive in marriage Elizabeth, the daughter of the King of France. Meanwhile at home the matter of religion continued to be treated by the new government much as it had been by the old. No Roman Catholics were put to death during this reign, though many were fined, imprisoned, and others not capitally punished; but on the 2nd of May 1550, an unfortunate fanatic, Joan Becher, commonly called Joan of Kent, was burnt for certain opinions considered to be neither Roman Catholic nor Protestant, in conformity with a warrant extorted by Cranmer from the king about a year before; and on the 2nd of May 1551, an eminent surgeon, named Von Pania, of Dutch extraction, but resident in London, paid the same penalty for his adherence to a similar heresy. Bishop Bonner was deprived of his see in September 1549; Gardiner in January 1551; and Day of Chichester, and Heath of Worcester, in October of the same year. The forty-two articles of belief, afterwards reduced to thirty-three, were promulgated in the early part of this year.

In April 1552, Edward was attacked by small-pox; and, although he recovered from that disease, the debility in which it left him produced other complaints, which ere long began to assume an alarming appearance. By the beginning of the following year he was very ill. Northumberland now lost no time in arranging his plans for bringing the crown into his own family. In May his son Lord Guildford Dudley married the Lady Jane Grey, the eldest daughter of the Duchess of Suffolk, who was herself the eldest daughter, by her second marriage with Charles Brandon, duke of Suffolk, of Mary Tudor, ex-queen of France, and the daughter of Henry VII., upon whose descendants Henry VIII. had by his will settled the crown on failure of the lines of his son Edward and of his daughters Mary and Elizabeth. This settlement, it is to be remembered, had been made by Henry under the express authority of an act of parliament, which empowered him to dispose of the kingdom to whomsoever he chose, on failure of

his three children. Northumberland now applied himself to induce Edward to make a new settlement excluding Mary and Elizabeth, who had both been declared illegitimate by parliament, and to nominate Lady Jane Grey (in whose favour her mother the Duchess of Suffolk, still alive, agreed to renounce her claim) as his immediate successor. The interest of the Protestant religion, which it was argued would be more secure with a sovereign on the throne whose attachment to the principles of the Reformation was undoubted, and on whose birth there was no stain, than if the succession were left to be disputed between the king's two sisters, one of whom was a bigoted Roman Catholic, and the legitimacy of either of whom almost implied the illegitimacy of the other, is believed to have been the chief consideration that was urged upon the dying prince. Edward at all events was brought over to his minister's views. On the 11th of June, Montague, the chief justice of the Common Pleas, and two of his brethren, were sent for to Greenwich, and desired to draw up a settlement of the crown upon the Lady Jane. After some hesitation they agreed, on the 14th, to comply with the king's commands, on his assurance that a parliament should be immediately called to ratify what was done. When the settlement was drawn up, an engagement to sustain it was subscribed by fifteen lords of the council and nine of the judges. Edward sunk rapidly after this, and lived only till the evening of the 6th of July, when he expired at Greenwich. His death however was concealed for two days, and it was not till the 9th that Lady Jane Grey was proclaimed.

Edward VI. is stated by the famous Jerome Cardan, who was brought to see him in his last illness, to have spoken both French and Latin with perfect readiness and propriety, and to have been also master of Greek, Italian, and Spanish. In his conversation with Cardan, which the latter has preserved, he showed an intelligence and dexterity which appear to have rather puzzled the philosopher. Walpole has set him down among his royal authors on the strength of his 'Diary,' printed by Burnet in his 'History of the Reformation,' and the original of which is still preserved among the Cottonian manuscripts; a lost comedy which is attributed to him, called 'The Whore of Babylon;' some Latin epistles and orations, of which specimens are given by Strype; a translation into French of several passages of Scripture, preserved in the library of Trinity College, Cambridge; a tract in French against popery, entitled 'L'Encontre des abus du monde;' and a few other productions of a similar kind which have not been printed.

The act of the 1st Edward VI. gave to the king all the colleges, free chapels, chauntries, hospitals, &c., which were not in the possession of his father by the act passed in the 37th year of Henry's reign. This act was much abused; for though one professed object of it was the encouragement of learning, many places of learning were actually suppressed under it. The king however afterwards founded a considerable number of grammar-schools, which still exist, and are popularly known as King Edward's Schools.

In 1556, in the reign of Queen Mary, a boy of the name of William Fetherstone, or Constable, a miller's son, was hanged at Tyburn for giving himself out to be Edward VI.

EDWARD THE BLACK PRINCE. [EDWARD III.]

* EDWARDES, HERBERT BENJAMIN, Major in the East India Company's service, was born in January 1820, at Frodesley in Shropshire. His father, the Rev. B. Edwardes, was rector of Frodesley. He completed his education at King's College, London. His uncle, Sir Henry Edwardes, of Ryton Grove, Shrewsbury, having procured him a nomination to a cadetship, he was examined and passed on the 26th of August 1840. He landed at Calcutta in January 1841, and was soon afterwards attached to the 1st European regiment. In November 1845 Lieutenant Edwardes was appointed aide-de-camp to Sir Hugh Gough (now Viscount Gough), then commander-in-chief of the British army in Hindustan, and was present at the battle of Moodkee, December 18, 1845, when he was wounded. Having recovered from his wound, and resumed his duties as aide-de-camp, he was actively engaged at the battle of Sohraon, February 10, 1846. Lieutenant Edwardes, having studied the native languages, was declared qualified to act as interpreter, and in April 1846 was appointed third assistant to the Commissioners of the Trans-Sutlej Territory, and in January 1847 first assistant to Sir Henry Lawrence, the Resident at Lahore.

Lieutenant Edwardes was employed to collect the revenue in the north-west of the Punjab, and here he commenced that series of skilful and energetic operations which, though limited to the short period of one year, have obtained for him a place among the most distinguished of the military officers of the present day. He has himself given a narrative of the operations in which he was engaged in a work which he published in 1851, 'A Year on the Punjab Frontier in 1848-49,' by Major Herbert B. Edwardes, C.B., 2 vols. 8vo. The services performed by Lieutenant Edwardes during the first three months of that eventful year are unknown in this country except by those who have read his own account of them. What those services were may be best stated in his own words, merely premising, that the valley of Bunnoo is in the north-west of the Punjab, and is estimated to yield a revenue of about 15,000*l*. He observes, that his object in writing the first part of his book "is to put on record a victory which I myself remember with more satisfaction than any I helped to gain

before Mooltan—the bloodless conquest of the wild valley of Bunnoo. It was gained neither by shot nor shell, but simply by balancing two races and two creeds. For fear of a Sikh army, two warlike and independent Muhomudan tribes levelled to the ground at my bidding the four hundred forts which constituted the strength of their country; and for fear of these same Muhomudan tribes, the same Sikh army, at my bidding, constructed a fortress for the crown, which completed the subjugation of the valley."

The operations by which Lieutenant Edwardes obtained his celebrity in Great Britain were commenced in April 1843. Mr. Vans Agnew of the Bengal Civil Service, and Lieutenant Anderson of the Bombay Fusiliers, having accompanied the newly-appointed governor of Mooltan from Lahore, arrived at the city of Mooltan on the 19th of April, and were murdered on the 20th by order of the Dewan Moolraj, who was to have been superseded in his government. On the following morning Moolraj began to make preparations for a war with the British, who, on the 9th of March 1846, had become by treaty the protectors of Dhuleep Sing, the Maharaja of Lahore. Lieutenant Edwardes, who was then on the west bank of the Indus, near Dera Fati Khan, having communicated with Sir Henry Lawrence, and received his authority to operate against Moolraj, immediately wrote to General Cortlandt, who was in the Bunnoo districts, to come to his assistance. Edwardes having been joined by Cortlandt, they descended the Indus on the western side, while 10,000 troops sent against them by Moolraj descended on the eastern side. Meantime the Nawab of Bhawalpoor had put his army in motion against Moolraj, and threatened Mooltan. Moolraj, fearing for his capital, recalled his army, which fell back to the left bank of the Chenab, between Mooltan and the nawab's troops. This retrograde movement having left open the passage of the Indus, Edwardes brought over his troops, and hastened to throw them across the Chenab, and form a junction with the Bhawalpoor army before it could be attacked by the forces of Moolraj. On the evening of the 17th of June, he got over with great difficulty, for want of boats, 3000 irregular infantry and 80 horse (mounted officers), but no guns, Cortlandt remaining behind to obtain boats and transport the guns with the remainder of the troops. The Bhawalpoor army was attacked at eight o'clock in the morning of the 18th of June, near Kenyree, and after fighting about two hours, withdrew to some strong ground out of range, leaving Edwardes with his small body of men to resist the attack of the whole Sikh army till Cortlandt could get the guns over the river. The enemy now bore down in front on Edwardes's position with about 10,000 men and ten guns, whilst about 2000 cavalry hovered on his flanks. Fortunately the ground was broken, and afforded good cover, and they resisted repeated attacks till the little band was in such danger of being swept away, that Edwardes, as a last effort to gain time, ordered the mounted officers to charge the foremost of the enemy. They obeyed his command nobly, with the loss of several of the small troop, but checking for a time the advance of the enemy. Edwardes, speaking of that critical moment, observed, "I did not think I had ten minutes to live." Short as the check was it gave time for one gun to be brought up, which was immediately opened, and was followed by a regiment of Cortlandt's infantry, then by another gun and another regiment, till there were six guns pouring in grape and round shot, and upwards of 4000 infantry in action. The Sikh army was put to flight, and never halted till it was safe within the defences of the city of Mooltan. For his conduct in this battle and the series of operations which preceded it Lieutenant Edwardes received the local rank of major in the Lahore territories.

Moolraj and his troops were confined within the fortifications of Mooltan, but not without incessant watching, fighting, and danger to the besiegers, during which, in the month of July, a pistol, which Major Edwardes was thrusting into his belt, exploded, and the contents passed through his right hand, shattering it in such a manner that amputation became necessary. General Whish's army reached Mooltan on the 18th and 19th of August, and regular siege was soon afterwards laid to the city, but on the defection of Shere Sing, who withdrew with all his troops and artillery, it was deemed prudent to suspend the siege, and wait for additional troops and guns from Bombay. These arrived on the 15th of December, and the siege was recommenced. The city was taken January 4, 1849, and the citadel, January 22. Major Edwardes's brother, a lieutenant in the Bengal Native Infantry, was killed by the falling of his horse at Ferozepoor, on the 13th of December 1848.

After the termination of the war Major Edwardes came to England, where he married. He spent a few months in Wales, wrote and published his 'Year on the Punjab Frontier,' and in 1851 returned to India. On the 20th of October 1849 he was created by special statute an extra member of the companions of the Order of the Bath. He is now Commissioner at Peshawar. He has a pension for his wound received at the battle of Moodkee, but none for the loss of his hand, that having been by accident and not in action. The East India Company have voted him an annuity of 100*l.*, and the Court of Directors have struck a gold medal in his honour.

EDWARDS, BRYAN, the historian of the British West India colonies, was born at Westbury, in Wiltshire, May 21, 1743. Family losses caused him, towards the end of 1759, to go to Jamaica, where he was kindly received by his mother's brother, Zachary Bayly, a rich, energetic, and enlightened planter, who, seeing the young man's fond-

ness for books, and thinking well of his talents, engaged a tutor to reside with him. His early instruction had been confined to reading, writing, and the French and English languages; and his studies in Jamaica, by his own account, were slight and desultory: still we may fairly ascribe to them no small share in preserving him from that intellectual listlessness into which Europeans sent out in early life to tropical climates are apt to fall. At this period the autobiography prefixed to the second and later editions of his 'History of the West Indies' ends; and the accounts given of his remaining life are extremely scanty. It appears however that in due time he succeeded to his uncle's estate, and became a wealthy merchant, and an active member of the House of Assembly. In 1784 he published a pamphlet in opposition to the government policy of limiting the trade between the West Indies and the United States to English bottoms, in which he maintains that "even the welfare of the planter concurs with the honour of government and the interests of humanity, in wishing for the total abolition of the slave-trade:" an opinion which he resented after the subject of the slave-trade had been brought before parliament. In 1791 he went to St. Domingo, on the breaking out of the insurrection of the negroes, and acquired the materials for his 'Historical Survey' of that island, published in 1797. Afterwards he removed to England, where, in 1796, we find him member of parliament for Grampound, which he represented until his death, July 15, 1800.

His principal work, the 'History, Civil and Ecclesiastic, of the British Colonies in the West Indies,' was published in 1793. It treats of the history, constitution, and political relations towards Britain, of these colonies; the manners and dispositions of the inhabitants, especially the negroes; the mode of agriculture and produce. It is a valuable contribution to our literature. The style is somewhat ambitious, but lively and attractive; the matter varied and interesting. The author enters largely into the question of the slave-trade, the cruelty of which he does not attempt to deny, though he is warm in defence of the planters against the charges of cruelty brought against them in England; but his arguments are evidently tinctured by the feeling that, lamentable as it may be, slaves must be had. Mr. Edwards has the merit of having carried a law to prevent cruelties to which slaves in Jamaica were at least legally exposed, whatever the practice might be.

The edition of 1819 contains also the history of St. Domingo, proceedings of the governor, &c., in regard to the Maroon negroes (1796), a continuation of the history down to that time, and one or two other pieces by other hands.

EDWARDS, JONATHAN, was born at East Windsor, in the province of Connecticut, on the 5th of October 1703. He was the only son, among eleven children, of Timothy Edwards, who was minister of East Windsor, or (as it was then) the eastern parish of Windsor, during a period of sixty-three years, and who, being a learned, exemplary, and devout man, was much beloved and respected by his flock. Until the age of thirteen Jonathan was educated at home. He began to learn Latin when six years old, under the care of his father and elder sisters, all of whom the father had made proficient in that language. He seems to have begun writing letters and essays at a very early age; and such of his early compositions as are preserved show a remarkable inquisitiveness concerning both mental and natural phenomena, and a by no means contemptible skill in explaining them. President Dwight, his biographer, has given a fragment written by him in the bantering style, when he could not have been more than twelve years old, against some one who had contended for the materiality of the soul, which shows considerable wit, reach of thought, and power of expression. There is also preserved an entertaining and instructive account of the habits of spiders, as observed by himself, which was written before he was thirteen. He was also led very early to religious meditation, and imbued with a deep sense of religion. He says of himself, in an account of his religious progress, written later in life for the benefit of his children:—"I had a variety of concerns and exercises about my soul from my childhood; but had two more remarkable seasons of awakening before I met with that change by which I was brought to those new dispositions, and that new sense of things, that I have since had. The first time was when I was a boy, some years before I went to college, at a time of remarkable awakening in my father's congregation. I was then very much affected for many months, and concerned about the things of religion and my soul's salvation; and was abundant in religious duties. I used to pray five times a day in secret, and to spend much time in religious conversation with other boys. . . . I, with some of my school-fellows, joined together, and built a booth in a swamp, in a very retired spot, for a place of prayer. And besides I had particular secret places of my own in the woods, where I used to retire by myself, and was from time to time much affected."

He went to Yale College, in Newhaven, at the age of thirteen. In the second year of his residence at the college, when only fourteen, he read through Locke's 'Essay on the Human Understanding;' and President Dwight has published some of his notes on the topics treated of in the essay, which show that he could then understand and appreciate it. The same biographer has published notes on the natural sciences and on theology, which were collected by Edwards during his stay at college. It was in the fourth and last year of his collegiate life that his second 'awakening' took place, an awakening which was

speedily followed by a second relapse. "But in process of time," he observes, in continuation of what has been already quoted, "my convictions and affections wore off; and I entirely lost all those affections and delights, and left off secret prayer, at least as to any constant performance of it; and returned like a dog to his vomit, and went on in the ways of sin. Indeed I was at times very uneasy, especially towards the latter part of my time at college; when it pleased God to seize me with a pleurisy, in which he brought me nigh to the grave, and shook me over the pit of hell. And yet it was not long after my recovery before I fell again into my old ways of sin." His final and entire conversion took place shortly after his taking his B.A. degree in September 1720. The chief symptom of his 'conversion' is thus described by him:—"From my childhood up, my mind had been full of objections against the doctrine of God's sovereignty in choosing whom he would to eternal life, and rejecting whom he pleased; leaving them eternally to perish, and be everlastingly tormented in hell. It used to appear like a horrible doctrine to me; but I remember the time very well when I seemed to be convinced, and fully satisfied, as to this sovereignty of God, and his justice in thus eternally disposing of men according to his sovereign pleasure. . . . And there has been a wonderful alteration in my mind with respect to the doctrine of God's sovereignty from that day to this; so that I scarce ever have found so much as the rising of an objection against it in the most absolute sense, in God showing mercy to whom he will show mercy, and hardening whom he will. God's absolute sovereignty and justice, with respect to salvation and damnation, is what my mind seems to rest assured of, as much as of anything that I see with my eyes; at least it is so at times."

Edwards stayed at college two years after taking his B.A. degree, preparing for the ministry. In August 1722 he went to New York, having been invited by the English Presbyterians in that town to become their minister. His diary records constant religious meditations during his eight months' stay at New York, and on the 12th of January 1723 he relates that he solemnly dedicated himself to God. "I made a solemn dedication of myself to God, and wrote it down, giving up myself, and all that I had, to God; to be for the future in no respect my own; to act as one that had no right to himself in any respect." He left New York in April 1723, and returned home. In September of the same year he took his M.A. degree, and shortly after he was chosen tutor of Yale College, an office which he filled with great credit. Two years after he accepted an invitation from Northampton, in Massachusetts, to assist his maternal grandfather, the Rev. Solomon Stoddard, in the ministry; and, having resigned his tutorship, he was ordained colleague to his grandfather at Northampton in February 1727, in the twenty-fourth year of his age. Shortly after, he married.

Between the time of his going to New York and his settlement at Northampton, Edwards wrote out seventy resolutions, which he kept before him as his guides through the remainder of his life. They are published in President Dwight's 'Life.' They mostly refer to the governing of his morals and the performance of religious exercises.

He remained at Northampton first as assistant to his grandfather, and after his grandfather's death as sole minister for twenty-three years. He was all this while indefatigable in the discharge of his duties as minister, and diligent in self-improvement. He was an effective preacher, and acquired much fame on the occasion of a very general 'revival' in the years 1740 and 1741: ministers and congregations from all parts of New England applied to Edwards for assistance, and solicited him to come among them and preach. It was at the time of this revival, and in order to moderate men's zeal, that he wrote his treatise on 'Religious Affections.' A revival had previously taken place in his own parish of Northampton in 1734, an account of which was at the time published by himself under the title, 'A Faithful Narrative of the Surprising Work of God, in the Conversion of many hundred Souls in Northampton:' this work excited much interest among what is known as the religious public of England, where it was republished in 1736 under the editorship of Dr. Isaac Watts.

On the 22nd of June 1750, Edwards was dismissed ignominiously from his charge at Northampton. He had offended a large and influential part of his congregation, no less than six years previously, by taking some very active and, as they appeared, arbitrary measures, in consequence of a reported circulation of obscene books among the younger members of his flock. He was openly resisted in his attempts to make a public example of the offenders, and from that time his influence over his flock was greatly weakened. But the cause of the final rupture between himself and his flock, and of his dismissal, was a different one. It was a refusal to admit "unconverted" persons, or (in other words) persons who either could or would not say that they had really embraced Christianity, to a participation in the sacrament. The custom of admitting such persons had been introduced by his predecessor, and not without opposition; and now, after the custom had been established some time, a fiercer opposition was raised by an attempt to get rid of it. On Edwards's first announcement of his disapprobation of the custom, and of his determination to end it, his dismissal was immediately clamoured for. This was in the spring of 1744; and the six intervening years having been spent in continual disputes, and fruitless attempts to effect a reconciliation, he was dismissed in 1750. A council had been appointed, consisting of ten

neighbouring ministers, to adjudicate between Edwards and his flock; and this council determined by a majority of one "that it is expedient that the pastoral relation between Mr. Edwards and his church be immediately dissolved, if the people still persist in desiring it." On its being put to the people, more than two hundred voted for his dismissal, and only twenty against it.

In August 1751 Edwards went as missionary to the Indians at Stockbridge, a town in the western part of Massachusetts Bay, having been applied to for the purpose by the Boston Commissioners for Indian Affairs, and having also received an invitation from the inhabitants of Stockbridge. Here he had much leisure; and it was during his stay at Stockbridge that he wrote his 'Inquiry into the Freedom of the Will,' and his Treatise on 'Original Sin.' The first of these works, and that on which his fame chiefly rests, was written in nine months, and was published in 1754. In 1757 he was chosen, without any solicitation on his part, and much to his surprise, president of Princeton College, New Jersey. Having after some deliberation accepted the appointment, he went to Princeton in January 1758, and was installed president. He died of the small-pox on the 22nd of the following March.

It may be inferred, from the account which we have given of his life, that the character of Jonathan Edwards was eminently estimable. He was an industrious, meek, conscientious, kind, and just man. In religion he was a Calvinist; and his principal work, that on the Will, was written in defence of the Calvinistic views on that subject and against those entertained by Arminians.

Edwards's chief works are:—1, 'A Treatise concerning Religious Affections;' 2, 'An Inquiry into the modern prevailing notions respecting that Freedom of the Will which is supposed to be essential to Moral Agency, Virtue, and Vice, Reward and Punishment, Praise and Blame;' 3, 'The Great Christian Doctrine of Original Sin defended; containing a Reply to the Objections of Dr. John Taylor;' 4, 'The History of Redemption;' 5, 'A Dissertation concerning the end for which God created the World;' and 6, 'A Dissertation concerning the true nature of Christian Virtue.' The three last works were published after his death.

Jonathan Edwards's works on the 'Freedom of the Will' and 'Original Sin' are the acknowledged authorities in defence of the leading views of what is generally known as Calvinistic Divinity. The 'Inquiry into the Freedom of the Will' is beyond dispute the most comprehensive and masterly treatise in which that subject is regarded as a question of metaphysical theology; and whatever may be the opinion arrived at by the reader as regards either the principal or secondary conclusions of the author, there can be no question as to the profundity of his reasoning, or the clearness and force with which he sets forth his arguments. Edwards was in fact one of the greatest metaphysicians and most powerful reasoners of his age, and his writings, though deficient in the graces of style, will, apart from their value as exponent of the views of a great theological party, be of permanent value as examples of comprehensive investigation and acute logic.

The best and most complete edition of Edwards's works is that edited by President Dwight, in ten volumes. There is also an edition in eight volumes, published in London, 1817. The 'Inquiry into the Freedom of the Will' has been published separately, with an 'Introductory Essay' by Mr. Taylor, the author of 'The Natural History of Enthusiasm.'

EDWARDS, RICHARD, one of our earliest dramatic writers, was born in Somersetshire in 1523. He was educated at Oxford, in Corpus Christi College, where he was successively a scholar and fellow: he took his degree of Master of Arts in 1547. Removing to Lincoln's Inn, he was made, in the beginning of Elizabeth's reign, one of the gentlemen of the Queen's Chapel, and master of the children there, a post which engaged him in theatrical management. He is first heard of as a dramatic poet in the year 1564-5; and his death is said to have taken place in 1566. Although he is highly commended for his dramatic works by Pattenham (no very competent judge), who sets him down as one of the two best writers in comedy and interlude, we learn the names of no more than two of his dramas. One of these, 'Palamon and Arcite,' was never printed, and is lost: the other, 'The excellent comedie of two the most faithfull frendes Damon and Pithias,' was printed in a black-letter 4to, in 1571, again in black-letter 4to, 1582, and is included in the first volume of Dodsley's 'Old Plays.' Edwards also wrote some of the poems inserted in 'The Paradise of Dainty Devises,' 1575, reprinted in the 'British Bibliographer,' and a death-bed poem, called 'Edwards' Soul-Knell.' His name is interesting as belonging to one of the rude founders of our drama; but his surviving play, in its artificial structure and unpoetical and undramatic details, offers little that can attract any but the student of literary antiquity.

EDWIN, King of Northumbria, was the son of Ella, who appears to have reigned in that kingdom from about A.D. 559 to 589. On the death of Ella the throne was seized by Edlfrid, or Ethilfrith, the husband of his daughter Acoo, and Edwin, an infant, of only three years old, was conveyed to the court of Cadvan, the king of North Wales. Edlfrid on this made war upon Cadvan, and defeated him near Chester, on which occasion it is said that 1200 monks of the monastery of Bangor, who had assembled on a neighbouring hill to

offer up their prayers for the success of Cadvan, were put to death by the pagan victor. After this Edwin wandered about for some years till he was, at last, received and protected by Redwald, king of the East Angles. It appears to have been while resident here that he married Cwenburgha, the daughter of Ceorl, king of Mercia. Edilfrid however, who had made himself by his military success very formidable to all the neighbouring princes, still pursued him, and partly by threats, partly by promises, had nearly induced Redwald to give him up, when (by a miraculous interposition, as Bede would have us believe) more generous counsels prevailed, and the East Anglian king determined to brave the hostility of Edilfrid. Redwald is the fifth in the list of the Bretwaldas, or supreme kings of Britain, as given by Bede; and as he succeeded Ethelbert of Kent, who died in 616, he probably now held that dignity. The consequence of his refusal to deliver up Edwin was a war with Edilfrid; they met on the right bank of the Idel in Nottinghamshire in 617, and in a great battle which was there fought, Edilfrid was defeated and slain. His children, of whom the names of six are recorded, fled, and Edwin ascended the throne of Northumbria. His valour and abilities eventually acquired for him great power. On the death of his friend Redwald in 624, he was acknowledged as his successor in the dignity of Bretwaldas; and two years after he made war upon the powerful state of Wessex, whose king Cuicelm is accused of having attempted to take him off by assassination, and reduced it for the moment to subjection, though it does not appear that he retained his conquest. Bede affirms that his sovereignty extended over all the English, excepting only the people of Kent, and that he also subjected to his dominions all the Britons, and the islands of Man and Anglesey. It is probable that he was accounted the leading power among the sovereigns of Britain in his time. Bede says that he was addressed by Pope Boniface as 'Rex Anglorum.'

The event for which the reign of Edwin in Northumbria is chiefly memorable is the introduction of Christianity into that kingdom. The legend is related at great length by Bede in the second book of his 'History.' Of the dreams or visions, the prophecies, and the supernatural visitations, which constitute the greater part of it, it is impossible to make anything in the absence of all other testimony except that of the credulous historian; but the result appears to have been brought about by the exertions of Edwin's second wife, Edilberga, the daughter of Augustine's patron, Ethelbert, king of Kent, and of Paulinus, a Roman missionary whom she had been allowed to bring with her from her father's court. Edwin had long stood out against the persuasions of his queen and Paulinus; but his escape from the attempt against his life by the King of Wessex, or of the West Saxons, and the birth of a daughter, happening simultaneously, powerfully affected him, and Edilberga and her chaplain, taking advantage of the moment of emotion, prevailed with him to call a meeting of his witan to discuss the question of the two religions. When the nobility of Northumbria assembled, Coifi, the high priest, was himself the first to profess his disbelief in the deities he had been accustomed to serve. This ended the dispute; the chief temple of the idols, which stood at a place still called Godmundham (that is, the hamlet of the inclosure of the God), was profaned and set fire to by the hand of Coifi; the king and all the chief men of the country offered themselves to be baptized, and the commonalty soon followed their example. Paulinus was made bishop of Northumbria, his residence being established at York, in conformity with the design of Gregory the Great, when the original mission to England was arranged. The archiepiscopal dignity was soon after conferred upon Paulinus by Pope Honorius. Edwin however did not long survive these events. The Mercians, under their king Penda, revolted against the supremacy claimed by Northumbria; and a war which arose in consequence was ended on the 12th of October 633 by a battle fought at Heathfield, or Hatfield, in Yorkshire, in which Edwin was defeated by Penda and his ally Cadwalla, king of North Wales, and lost at once his kingdom and his life. His eldest son was slain at the same time; another, whom he also had by his first wife, was afterwards put to death by Penda; and Edilberga, with her children and Paulinus, was compelled to fly to the court of her brother in Kent. One of Edwin's daughters, Eanfled, afterwards married Oswio, a son of Edilfrid, who mounted the throne of Northumbria in 642 and reigned till 670. He defeated Penda, and regained the title of Bretwaldas, which Edwin had first brought into his house.

EDWY, or EADWIG, called the Fair, King of the Anglo-Saxons, was the eldest of the two sons of Edmund I., but, being only in his seventh or eighth year at his father's death in 946, he and his brother Edgar were set aside for the present in favour of their uncle Edred. On Edred's death in 956, Edwy became king, and his brother appears to have been at the same time appointed subregulus of Mercia. About two years after, the Mercians and Northumbrians rose in revolt, with Edgar as their leader, and a war ensued, which terminated in an agreement between the two brothers that Edwy should retain the country to the south of the Thames, and that Edgar should be acknowledged king of all England to the north of that river. In this revolt Edgar, a mere boy, seems to have been an instrument in the hands of the clerical party, whom Edwy had made his enemies almost from the moment of his accession. In whatever it was that the quarrel began, it soon led to the dismissal of Dunstan and his friends,

who had acquired so great an ascendancy in the government in the reign of the preceding king. The writers upon whom we are dependent for the history of this period were all monks, and, as he was the only obstacle to the triumph of their order, their testimony is to be cautiously received. They concur in representing Edwy as a prince of the most dissolute manners, and the kingdom as given up to oppression and anarchy under his rule. Henry of Huntingdon however says, "This king wore the diadem not unworthily; but after a prosperous and becoming commencement of his reign, its happy promise was cut short by a premature death." The tragical story of Elgiva (or Ælgyfu), as commonly told, is familiar to most readers. Edwy is said to have married this lady, though they were related within the prohibited degrees, and to have incurred the enmity of the ecclesiastics by that violation of canonical law more than by any other part of his conduct. On the day of his coronation Dunstan tore him rudely from the arms of Elgiva, to whose apartment he had retired from the drunken revelry of the feast. Dunstan's friend, Archbishop Odo, subsequently broke into one of the royal houses with a party of soldiers, and, carrying off the lady, had her conveyed to Ireland, after having disfigured her by searing her face with a red-hot iron; and when some time after she ventured to return to England, some of the archbishop's retainers seized her again, and put her to death by the barbarous process of cutting the sinews of her legs with their swords. This story has been the subject of some controversy, and the defence of Dunstan and Odo has been undertaken by Dr. Lingard, who does not however deny the main facts of the conduct imputed to them. "Ham-stringing," he says, "was a cruel but not unusual mode of punishment in that age." He attempted to show that the lady was not the wife but the mistress of Edwy; and, that being the case, he contends that Odo was justified, first, in sending her to Ireland, by a law of King Edward the Elder, which declared that "if a known whore-queen be found in any place, men shall drive her out of the realm;" and then in having her put to death on her return, inasmuch as "he believes that, according to the stern maxims of Saxon jurisprudence, a person returning without permission from banishment might be executed without the formality of a trial." But Mr. Kemble has found a document in which "Ælgyfu, the king's wife," was an attesting witness, along with her mother, and several bishops, to an exchange of lands, "by leave of King Eadwig, between Bishop Byrthelm and Abbot Ethelwold;" and, as he justly observes, "This was not a thing done in a corner, and the testimony is conclusive that Ælgyfu was Eadwig's queen." For the full discussion the reader is referred to Lingard, 'Antiquities of the Anglo-Saxon Church,' 'History of England,' and 'Vindication of his History,' 8vo; 'Letter to Francis Jeffrey, Esq.,' by John Allen, Esq., 8vo, 1827; and the articles on Dr. Lingard's two works in the 'Edinburgh Review,' vol. xxv. pp. 346-364, and vol. xlii. pp. 1-31, both in that letter acknowledged to be by Mr. Allen: see also Kemble, 'Saxons in England,' vol. ii.; and Knight, 'Pop. Hist. of Eng.,' i. 134, &c.

Edwy died in 958, within a year after the pacification with his brother. It is difficult to say whether the expressions of the chroniclers imply that he was murdered, or only that he died of a broken heart. Edgar now became sole king.

ECKHOUT, ANTHONY VANDER, was born at Brussels in 1658. It is not known under whom he studied; but he went to Italy with his brother-in-law, Lewis Deyster, a very eminent artist, and painted in conjunction with him during his residence abroad—Deyster painting the figures, and Eckhout the fruit and flowers: yet there was such a harmony in their style of colouring and touch, that their works appear to be all by one hand. Though he was received with great marks of distinction on his return to Brussels, and appointed to an honourable office, he was resolved to leave his friends and country, and the brilliant prospects which he had before him, in order to return to Italy, intending to spend there the remainder of his days. The vessel however chanced to touch at Lisbon, and he was induced to stop in that city. His pictures sold at excessively high prices; and he had made so many sketches of fine fruit and flowers in Italy, that he had sufficient for all his future compositions, in which he arranged them with infinite variety and great taste. He had not been above two years in Lisbon when a young lady of quality and large fortune married him. Unhappily his success and his wealth excited the envy of some miscreants, who, in 1695, shot him as he was taking an airing in his carriage. The assassins were never discovered.

ECKHOUT, GERBRANT VANDER, born at Amsterdam in 1621, was a disciple of Rembrandt, whose manner of designing, colouring, and pencilling, he imitated with such felicity, that it is difficult to distinguish some of his paintings from those of his master; and he rather excelled him in the extremities of his figures. His principal employment was for portraits, in which he was admirable, and he especially surpassed all his contemporaries in the power of portraying the mind in the countenance. His masterpiece was the portrait of his own father, which astonished even Rembrandt.

But though his excellence in portraits brought him continual employment in that branch, he greatly preferred painting historical subjects, in which he was equally successful. His composition is rich and judicious; and his distribution of light and shade excellent. His back-grounds are in general clearer and brighter than those of Rem-

brandt; and he was by far the best disciple of that master: on the other hand, it must be allowed that he shared in his defects, being incorrect in drawing, deficient in elegance and grace, and negligent of costume, while he was wanting in Rembrandt's originality and marvellous vigour. He died in 1674.

EFFEN, JUSTUS VAN, a Dutch man of letters of the 18th century who was connected in various ways with the literature of France and England, was born on the 11th of February (old style) at Utrecht, and studied at that university and at Leyden, where he finally took his degree as Doctor of Law. So early as at the age of fifteen he became private tutor to the son of a nobleman at the university, and spent the greater part of his life in the same line of occupation, for which he seems to have been peculiarly qualified. It was not till he was seventeen that he became acquainted with the French language, of which he made himself such a master that some of his anonymous productions in it had the honour of being attributed to Fontenelle. His first work of any consequence was 'Le Misanthrope,' a series of periodical essays in French on the plan of the English 'Spectator.' The original had been commenced at London in March 1711, and the imitation made its appearance at the Hague in May—a striking proof of the rapid popularity of the masterpieces of Addison. Three years afterwards Van Effen visited England in the capacity of secretary of embassy to the Baron Van Wassenaer Duivenwoorde, the father of his first pupil, who was sent by the States to congratulate George I. on his accession to the throne. He afterwards made a second visit as secretary of embassy to Count Van Welderen, who was sent on a similar occasion to congratulate George II. These journeys, and one which he made to Sweden as a companion to the Prince of Hesse-Philippsthal, seem to have been the only occasions of his leaving Holland.

When he was first in London he heard so much in society of Swift's 'Tale of a Tub,' and of the difficulty, if not impracticability, of transferring its force and humour to any other language, that he resolved to make the attempt, and produced a successful French translation. He afterwards rendered the same service to the 'Guardian' when it appeared, and to 'Robinson Crusoe.' His most important literary labours however were in connection with the 'Journal Littéraire,' a review published in the Hague, in which Van Effen took the principal part, sometimes writing whole numbers, and in which he had for a colleague, among others, Dr. Maty, who afterwards resided in England, and became principal librarian of the British Museum. All these works and some others, 'La Bagatelle,' 'Le Nouveau Spectateur,' &c., were in French, and Van Effen, who had never been in France, was forty-seven years of age before he published anything in his native language. In 1731 he commenced, and, as was usual with him anonymously, 'De Hollandsche Spectator,' or 'Dutch Spectator,' a fresh imitation of the English work, which he had begun his literary career by imitating. He kept it up with very little assistance till the 8th of April 1736, and he died on the 18th of September in the same year at Bois-le-duc, where he had been living for some time in easy competence, on the profits of a place which had been secured for him by one of his patrons.

The French works of Van Effen were collected and published at Amsterdam in 1742, in five volumes, with his life prefixed. Another and fuller life by Verwer is given in the second edition of his 'Hollandsche Spectator,' published at Amsterdam in 1756. The French works have long ceased to be reprinted; the Dutch one, which is by much Van Effen's best, is still in high repute for the beauty and lucidity of its style, in regard to which Van Effen may be considered as the Addison of Holland. In the select collation of the Dutch classics now publishing by Fuhri at the Hague, one volume is formed by 'Jest and Earnest, from the Dutch Spectator.' The pieces which have been taken in this selection are chiefly ethical essays or pictures of manners, one of which 'Kobus en Agnietje,' a sketch of courtship among the middle classes, is especially popular; but to an English reader some of the most interesting portions of the 'Spectator' are those which are omitted, the frequent references to English society, manners, and language, which have the recommendations of coming from an enlightened foreigner who had seen the London of Addison and Pope.

EGBERT, styled the Great, king of the West Saxons, was, according to the Saxon Chronicle, the son of Alcmund, whose descent is traced up through Eea, or Eata, and Eoppa, to Ingisil, or Ingild, the brother of the great Ina, and the undoubted descendant of Cerdic. The 'Chronicle' states Alcmund to have reigned in Kent; but this point, as well as the whole of the genealogy of Egbert, must be considered as doubtful. All that can be certainly affirmed is, that he was of the blood of Cerdic, and that he eventually came to be regarded as the representative, if not the only remaining male descendant of that founder of the royal house of Wessex. When Beorhtic, or Brihtic, became king in 755, Egbert, then very young, or his friends for him, had claimed the throne. Brihtic is said to have soon after made an attempt on his life, upon which he took refuge at the court of Offa, the powerful king of Mercia. After a short time however he lost Offa's protection, on Brihtic marrying Eadburga, the daughter of that king. Egbert then fled to France, where he was received by the Emperor Charlemagne, and at his court he abode till the death of Brihtic in 800. He was then recalled, and by the unanimous vote of the witan appointed to the vacant throne. William of Malmesbury,

who wrote in the 12th century, is the only authority for this history of Egbert's early life. He says, that besides other accomplishments he learned the art of war under Charlemagne, in whose armies he served for three years.

At the date of Egbert's accession the Saxon states in England were reduced to three independent sovereignties: Northumbria, comprehending what had occasionally been the separate kingdoms of Deira and Bernicia; Mercia, which had reduced to subjection Kent, Essex, and East Anglia; and Wessex, with which Sussex had become incorporated. Of these three powers, Northumbria was torn by internal dissensions, and probably was indebted for the preservation of its independence chiefly to the rivalry between the other two. The conquests and the able rule of Offa however had raised Mercia to a decided pre-eminence over Wessex; and at this time the Mercian throne was occupied by Cenwulf, who was well qualified to wield the sceptre of Offa, and who had even extended the territory which he had inherited from that king. The two states were at war when Egbert became king; but a peace was soon concluded between them; and so long as Cenwulf lived Egbert made no attempt at conquest over any part of Saxon England. For the first nine years of his reign indeed he seems not to have drawn his sword. He then (809) engaged in war against the alien tribes that still remained unsubdued in the west; and between that year and 814 he is recorded to have subjugated, or at least overrun and reduced to temporary submission, all Cornwall (including Devon) and South Wales. But soon after the death of Cenwulf in 819 we find him entering upon a new career. In 823 a dispute about the succession to the Mercian crown raised the East Angles in revolt. Egbert's aid, upon being applied for, was readily given to the insurgents; and a great battle took place at Ellendune (supposed to be Wilton), which ended in the complete defeat of the Mercians. Essex and Kent were immediately seized by Egbert, or voluntarily submitted to him. The East Angles in the meantime he professed to leave independent; and Mercia itself he did not think yet sufficiently weakened to be attacked with effect. A continuance of the dispute about the succession however, and another revolt of the East Angles, soon produced the state of things he waited for. In 827 he marched against Mercia; Wiglaf, the king, fled on his approach to the monastery of Croiland, but soon after made his submission, and was permitted to retain his kingdom as the vassal or tributary of Egbert. Egbert appears to have now taken East Anglia under his own immediate government. He is affirmed by Bede to have subjected to his rule all England to the south of the Humber. Without loss of time also he led his army against the Northumbrians; their king, Eanred, offered no resistance; but meeting Egbert at a place called Dore, to the north of the Humber, acknowledged him as Bretwalda. He is the eighth Saxon king who is stated to have acquired this dignity; the last was the Northumbrian king Oswio.

In the last year of the reign of Egbert several of those descents of the Danes or northern pirates were made upon the English coasts, which produced so much public confusion and calamity when renewed in the times of his son and his grandsons. In 832 they ravaged the Isle of Sheppey; and next year, appearing with a fleet of five-and-thirty sail in the river Dart, they landed and defeated a force that Egbert sent against them. When they returned however in 835, and landed in Cornwall, they and a number of the people of that district whom they had induced to join them, sustained a decisive overthrow from the king of Wessex in person. Egbert died the next year (836), after a reign of thirty-seven years and seven months, leaving his dominions between his eldest son Ethelwulf and Athelstane, who appears to have been the son of Ethelwulf. [ETHELWULF.]

Egbert is commonly said to have been the first Anglo-Saxon king who called himself 'King of the Angles,' or of England; but though a charter exists in which he is styled Rex Anglorum, in general both he and his successors down to Alfred inclusive call themselves only kings of the West Saxons. And although Egbert asserted a supremacy over the other states, which remained ever after with his kingdom of Wessex, it is to be recollected that he did not incorporate either Mercia or Northumbria with his own dominions. It does not appear that he even assumed to himself the appointment of the kings of those states. The reigning families seem to have continued in possession, with merely an acknowledgment of his supremacy as Bretwalda.

EGEDE, HANS, the apostle of Greenland, from whose arrival in that country the Greenlanders date a new era, was by birth a Norwegian. His father, a sorenskriver, or village judge, at Harstad, in the district of Nordlandene, in Norway, was the son of a Dane, the parish priest of Vester-Egede in Sieland, who was the first of the family to assume the surname of Egede, which he took from his parish. Hans Egede was born at Harstad on the 31st of January 1686, studied at Copenhagen, which, before the foundation of the University of Christiania, was the only university open to the natives of Norway; and in 1707, at the age of twenty-one, was ordained priest of Vaagen in northern Norway, and married a neighbour's daughter, Gertrude Rask, of the age of thirty-four. He had been married about a year when his mind began to dwell on the circumstance which he had seen mentioned in a description of Norway, that formerly there had been Christians in Greenland, where now there were only heathens, and he could not help considering with interest if it were possible that some descendants of the old Norwegians who had colonised the country

might be living ignorant of the Gospel. Greenland had in fact been discovered and colonised, not long before the year 1000, by the Norwegians settled in Iceland, who, conscious of the bad effect of the name of 'Iceland,' had taken care to give to their new, and still less attractive, discovery the seductive appellation of 'Greenland,' which had probably a great effect in drawing to those coasts the emigration which might otherwise have set in to their third discovery, Vinland, supposed by modern northern antiquaries to be Massachusetts. The 'black death,' or destructive plague of the year 1349, and the attacks of the native Skrællings, or Esquimaux, had put an end to the main or 'western colony' of the Norwegians in Greenland, but in the time of Egede the eastern coast had been for some centuries almost inaccessible from ice, and it was supposed by many that the 'eastern colony,' spoken of by the old Icelandic writers, was on the eastern coast, and might therefore be still existing unknown to the rest of the world. Egede, after receiving some suggestions to this effect from a friend in Bergen, became so enthusiastic on the subject, that he wrote to the bishops of Bergen and Trondhjem in 1710, proposing an expedition to convert the Greenlanders; and on its striking him that such a recommendation would come with an ill grace from one who did not offer to undertake it himself, he made the offer, supposing however, as he himself tells us, that as it was war-time, and the expedition would require some money, the proposal would not be accepted. He received in reply a strange letter from the bishop of Trondhjem, Krog, in which the prelate suggested that "Greenland was undoubtedly a part of America, and could not be very far from Cuba and Hispaniola, where there was found such abundance of gold;" concluding that it was very likely that those who went to Greenland would bring home "incredible riches." Egede had made this offer, very oddly, without acquainting his wife; and as soon as she became aware of it, by the receipt of the bishop's letters, she with her mother and his mother assailed Egede with such strong remonstrances, that, he says in his own account, he was quite conquered, and repulsed his folly with a promise to remain in the land which "God had placed him in."

Matters remained in this state till some quarrels with a neighbouring clergyman, and the trouble they occasioned, led Egede, "fishing," as he says, "in troubled waters," to mention the project again to his wife, when he no longer found her so unwilling, and having obtained her consent he thought lightly of any other obstacle. So strongly were both their minds now set on the undertaking that in 1717 he threw up his benefice at Vaagen, and went with his wife and four children to Bergen to endeavour to find a company to trade with Greenland, which he considered an indispensable part of his plan for founding a mission. Most of the merchants laughed at his project, and some considered him mad; but just about this time Charles XII. of Sweden was killed at Frederikshald, when apparently on the point of conquering Norway, peace was restored, and Egede determined to lay his plans before the king at Copenhagen. Frederick IV. of Denmark, who had already in 1714 founded a college for the propagation of the Gospel, sent Egede back to Bergen with his approbation; a company was formed, to which Egede put down his name for the first subscription of 800 dollars, and finally on the 3rd of May 1721, a ship called 'Haabet,' or 'The Hope,' set sail for Greenland, with forty-six souls on board, including Egede and his family. On the 3rd of July, after a dangerous voyage, they set foot on shore at Baalrevier on the western coast, and were on the whole hospitably received by the natives. The very appearance of the Greenlanders at once put a negative on the supposition that they were descended from the Northmen, and their language, which it was now the missionary's business to learn, was found to be entirely of a different kind, being in fact nearly related to that spoken by the Esquimaux of Labrador. The climate and the soil were both harsher and ruder than the Norwegians had expected, and the only circumstance that was in their favour was the character of the inhabitants, which, though at first excessively phlegmatic, so as to give the idea that their feelings had been frozen, was neither cruel, nor, as was found by further experience, unadapted to receive religious impressions. The natives however grew apprehensive when they found that their visitors built a house and intended to stay out the winter, and they were encouraged in their fears by the Dutch captains who visited the coast for the purposes of trade. The Dutchmen, Egede remarked, did more trade in half an hour with the natives than the Danes could succeed in doing in half a year, by the simple expedient of giving more wares in exchange and of better quality. For some years following both the mission and the factory had a hard battle for life. The settlers, unable to obtain sufficient food by fishing and the chase, were entirely dependent on the supply of provisions sent them by annual store-ships from Denmark, and when this supply was delayed, were reduced to short rations and the dread of starvation. On one occasion even Egede's courage gave way, and he had made up his mind to abandon the mission and return to Europe unless the provisions arrived within fourteen days. His wife alone opposed the resolution and refused to pack up, persisting in predicting that the store-ship would arrive in time, and ere the time had elapsed the ships, which had missed the coast, found their way, and brought tidings that rather than give up the attempt to Christianise Greenland, the king had ordered a lottery in favour of it, and on the lottery's failing had imposed a special tax on Denmark and Norway under the name of the Greenland Assessment.

In 1727 the Bergen company for trading with Greenland was dissolved, from the losses it had sustained, and the Danish government then resolved on founding a colony in Greenland, and sent in 1728 a ship of war, with a body of soldiers under the command of a Major Paars, and several horses, a sufficient proof that the nature of the country was not understood in Denmark, as horses among the rocks of Greenland were totally useless. The soldiers grew mutinous when they saw to what a country they had been sent, and Egede found his life in more danger from his countrymen than it had ever been from the natives. The death of King Frederick IV. in 1731 occasioned a change of affairs. The new king, Christian VI., determined to break up the colony and recall all his subjects from Greenland, with the exception of such as chose to remain of their own free will, to whom he gave directions that provisions were to be allowed for one year, but that they were to be led to expect no further supply. Egede had then been ten years in Greenland, and his labours were beginning to bear fruit. His eldest son Paul, who was a boy of twelve when they landed, had been of much assistance in learning the language and in other ways; his wife and the younger children had aided greatly in producing a favourable effect on the natives, who had seen no Europeans before except the crews of the Dutch trading-vessels. The Angeloks, or conjurers, who might almost be called the priests of the native religion, had been awed, some into respect and others into silence, by the mildness and active benevolence of the foreign Angelok; the natives had seen with wonder the interest he took in their welfare, and if they refused to believe the new doctrines themselves, had not forbidden them to their children, of whom Egede had a hundred and fifty baptised. The elder Greenlanders, when Egede told them of the efficacy of prayer, asked him to pray that there should be no winter, and when he spoke of the torment of fire said they should prefer it to frost. Egede, confirmed by his wife, resolved to remain, and this resolution greatly increased his influence over the Greenlanders, who knew that it could only proceed from zeal in their behalf.

The king of Denmark, unable to resist his constancy, sent another year's provision beyond what he had promised, and finally, in 1733, announced that he had changed his mind and determined to devote a yearly sum to the Greenland mission. A dreadful trial was approaching. The Greenland children, of whom some had occasionally been sent to Denmark, almost all died of the small pox. Two of them were returning home from Copenhagen in the vessel which came in 1733, one of them died on the voyage, the other brought the disorder to Greenland, and the mortality was dreadful. From September 1733 to June 1734 the contagion raged to a degree that threatened to depopulate Greenland. When the trading agents afterwards went over the country they found every dwelling-house empty for thirty leagues to the north of the Danish colony, and the same devastation was said to have extended still farther south: the number of the dead was computed at 3000. That winter in Greenland offered a combination of horrors which could seldom be equalled, but they were met with admirable constancy by Egede and his indefatigable wife. The same ship that brought the small pox had brought the assistance of some Moravian missionaries, the first of that devoted band who were to continue in Greenland the work that Egede had begun. In the year 1734 his son Povel Egede returned from Copenhagen, whither he had been sent to study, and the elder Egede, finding his health begin to fail, applied for leave to return home. He was now unable to continue his active labours as a missionary, but thought he might be of use in instructing in the language those who might devote themselves to the work, and would otherwise have to lose a portion of their time on arriving at the spot in studying the rudiments. The permission reached him in 1735, but his return was delayed from the illness of his wife, who longed to see her native land again, but was denied that gratification, dying finally in Greenland on the 21st of December 1735, at the age of sixty-two. Egede carried her coffin with him to Denmark, and she was buried in Copenhagen, where she was followed to the grave by the whole of the clergy of the city. A seminary for the Greenland mission was established there in 1740, and Egede was appointed superintendent with the title of bishop. In the same year he preferred a memorial for an expedition to be sent out to discover the lost 'eastern colony' of the old Norwegians, and offered to accompany it in person, but the proposal was not adopted. He had when in Greenland made a land expedition with a similar view, and discovered some ruins of buildings of a different character from those of the Greenlanders. It is now generally believed, since the researches of Graah and others, that the 'eastern colony' or 'Osterbygd' was so named merely from its position with regard to the other, and that both the 'eastern' and 'western' colonies were on the western coast. In 1747 Egede retired from his office at Copenhagen, and spent most of the remainder of his life at the house of his daughter Christine, who was married to a clergyman of the island of Falster. While he was at Copenhagen he had married a second wife, who accompanied him to Falster, but before his last illness he expressed his wish that he should be buried by the side of his first wife at Copenhagen, and said that if they would not promise to carry this wish into effect, he would go to Copenhagen to die there. He died at Falster on the 5th of November 1758.

Egede was the author of two works on the subject that occupied his life. One, the history of his mission, 'Omstændelig Relation

angaaende den Gronlandske Missions Begyndelse,' published at Copenhagen in 1738, is rich in materials, but is in itself of a somewhat dry and unattractive character. Its chief recommendation is its plain sincerity. The reader is disposed to give entire confidence to the missionary, who not only tells him that on one occasion he laboured earnestly in his vocation, but that on another he occupied himself for days in the study of alchemy, who not only speaks of the ardour of his faith at times, but tells us that at others he was seized with a hatred of his task and of religion altogether. This book has been translated into German, but not as yet into any other language. Egede's second work, 'Den gamle Gronlands nye Perlestrat' (Copenhagen, 1741-4), was translated into English in 1745 under the title of 'A Description of Greenland,' and the translation was reprinted in 1818. It comprises his observations on the geography and natural history of Greenland, and the manners of its inhabitants.

The account of the mission was continued by his son PAVEL or PAUL EGEDE, who, as has been stated, had gone to Greenland in 1720 in his twelfth year, had afterwards studied at Copenhagen, returned to Greenland in 1784, finally left it in 1740, became like his father superintendent of the mission with the title of bishop, and died in 1789. He wrote and published a Greenland Grammar and Dictionary, which have been since improved by Fabricius, translated the New Testament into the language, and was the author of a work 'Efterretninger om Gronland' ('Information on Greenland'), which is one of the most interesting in Danish literature. It gives a history of the mission from 1720 to 1788 in a more interesting style than his father was master of.

Another son of Hans Egede, NIELS EGEDE, who had spent his youth in Greenland, returned there in 1738 from Denmark, disgusted with the coldness of the reception he met with in Europe, and wished to spend the rest of his life among the Greenlanders, but was compelled to return by the state of his health in 1743. He founded the settlement of Egedesminde, so named in remembrance of his father.

EGERTON, THOMAS, Lord Chancellor of England, was born in 1540, in the parish of Doddlestone, Cheshire. He was the natural son of Sir Richard Egerton, of an ancient family in that county. Having been well grounded in Latin and Greek by private tuition, he was entered in 1556 of Brasenose College, Oxford, where he remained three years; and then, having taken his Bachelor's degree, removed to Lincoln's Inn, London. In due time he was called to the bar, and soon acquired reputation and practice. It was not long before Queen Elizabeth discovered his value, and made him one of her counsel, which entitled him to wear a silk gown, and to have precedence of the other barristers. He was appointed solicitor-general June 28, 1581, and he held this office till June 2, 1592, when he became attorney-general. Meantime, in 1582, he was chosen Lent Reader to Lincoln's Inn; he was also made one of the governors of that society, and so continued for twelve years successively. He was knighted in 1598, and was appointed chamberlain of the county-palatine of Chester. On the 10th of April 1594 he was made Master of the Rolls; and on the 6th of May 1596 he succeeded Sir John Puckering as Lord Keeper, the queen herself delivering the great seal to him at Greenwich. As a special mark of her favour, he continued to hold the office of Master of the Rolls, together with that of Keeper of the Great Seal, during the remainder of her reign. He was also sworn of her Majesty's privy council. Besides the performance of his duties as a lawyer and a judge, he was consulted and employed by the queen in her most secret councils and most important state affairs, and continued an especial favourite till her death. In August 1602 she paid him a visit of three days at his country-house of Harefield, near Uxbridge, Middlesex, where, among other entertainments provided for her, Shakespeare's tragedy of 'Othello' was played by Burbidge and his company. In her last illness at Richmond, in March 1603, she named to him the King of Scotland as her successor.

After Elizabeth's death, King James, by sign-manual, dated Holyrood House, Edinburgh, April 5, 1603, directed him to retain the office of Lord Keeper till further orders; and, having arrived in London, James, on the 19th of July caused the great seal to be broken, and placed a new one in Sir Thomas Egerton's hands, accompanied by a paper in his own writing, by which he created him Baron of Ellesmere, "for his good and faithful services, not only in the administration of justice, but also in council." On the 24th of July 1603 he was named Lord High Chancellor of England. After being made Lord Chancellor, he resigned the office of Master of the Rolls, which he had held nine years. In 1605 Lord Ellesmere was appointed High Steward of the City of Oxford, and on the 2nd of December 1610 was elected Chancellor of the University of Oxford.

On the 7th of November 1616, the king, with much reluctance, granted him permission to retire from office, and at the same time created him Viscount Brackley. On the 3rd of March 1617 he resigned the great seal, when Lord Bacon was appointed his successor. While he lay ill the king sent Buckingham and Lord Bacon to offer him the title of Earl of Bridgewater, and a pension of 8000*l.* a year. He refused both, saying "these things were now to him but vanities." He expired at York House, London, March 15, 1617, in the seventy-seventh year of his age, having held the great seal for a longer period continually than any of his predecessors or successors. He was

buried in the chancel of Doddlestone Church, Cheshire. His son, John Egerton, was created Earl of Bridgewater.

Thomas Egerton was a tall and athletic man, and very handsome, and retained his good looks to the last. Ben Jonson says, "He was a grave and great orator, and best when he was provoked." Lord Campbell, speaking of him as an equity-judge, makes the following observations:—"With a knowledge of law equal to Edward the Third's lay-chancellors Parmyng and Knyvet, so highly eulogised by Lord Coke, he was much more familiar with the principles of general jurisprudence. Not less noted for despatch and purity than Sir Thomas More, he was much better acquainted with the law of real property, as well as the practice of the court, in which he had long practised as an advocate; and exhibiting all the patience and suavity of Sir Nicholas Bacon, he possessed more quickness of perception, and a more vigorous grasp of intellect." ('Lives of the Chancellors,' vol. ii.)

*EGG, AUGUSTUS, A.R.A., was born in London in 1816. After the usual educational course in the schools of Mr. Sass and of the Royal Academy, Mr. Egg became for the first time in 1838 a contributor to the Academy exhibition by sending a 'Spanish Girl;' he also in these early years sent pictures to the Society of British Artists, and to the provincial exhibitions. The peculiar turn of his mind was perhaps first distinctly shown by the picture he exhibited at the Academy in 1840, 'A Scene in the Boar's Head, Cheapside;' and he has since been a pretty constant contributor of pictures illustrating scenes of humour from the pages of Shakespeare, Scott, Le Sage, &c., of the order technically styled 'genre.' Their clear bright colouring, vivacity, and a certain coarse theatrical freedom and geniality, made them favourites with those who relish a less refined fare than was afforded by Mr. Leslie, previously the chief caterer in the same walk. Without any marked departure from his original manner, Mr. Egg has shown a steady advance in the mechanical departments of his art, and he has on more than one occasion shown too that he has as yet done but imperfect justice to his talents. The following are the principal works he has contributed to the Royal Academy exhibitions since 1840:—"Scene from Romeo and Juliet," and an 'Italian Festa,' in 1841; 'Cromwell discovering his chaplain Jeremiah White making love to his daughter Frances,' 1842; 'The Introduction of Sir Pierce Shafton to Herbert Glendinning,' 1843; 'Scene from the Devil on Two Sticks,' 1844, now in the Vernon Gallery; 'Scene from the Winter's Tale,' 1845; 'Buckingham Rebuffed,' 1846; 'The Wooing of Katherine—from the Taming of the Shrew,' 1847; 'Queen Elizabeth discovers she is no longer young,' 1848, a ridiculous caricature in the very lowest grade of broad farce; 'Henrietta Maria in Distress relieved by Cardinal du Retz,' and 'Launce's substitute for Proteus's Dog,' 1849; 'Peter the Great sees Katherine, his future Empress, for the first time,' 1850; 'Pepys's Introduction to Nell Gwynne,' 1851, like the last, a very clever rendering of a subject not remarkable for its pictorial capability; 'Dame Ursula and Margaret,' 1854; and 'The Life and Death of Buckingham,' 1855. The 'Life and Death of Buckingham' is represented in dramatic fashion—within the same frame the profligate duke and his sovereign revelling with the courtiers and the courtizans of "the merry monarch," and the death of the debauchee, according to Pope's version of it, "in the worst inn's worst room"—both scenes being wrought out with uncompromising fidelity. In power it far surpassed any of Mr. Egg's previous productions, but it was sickening and repulsive, exactly in proportion to its truth and force. Mr. Egg was elected an associate of the Royal Academy in 1848.

EGINHARDT, a native of Austrasia or East France, was instructed by Alcuin, and by him introduced to Charlemagne, who made him his secretary, and afterwards superintendent of his buildings. His wife Emma, or Imma, is said by some to have been a daughter of that prince, and a curious story is related of their amours previous to their marriage, but the whole seems an invention. Eginhardt himself does not reckon Emma in his enumeration of the children of Charles. After the death of that monarch, Eginhardt continued to serve his successor, Louis le Débonnaire, who entrusted him with the education of his son Lotharius. But after a time Eginhardt resigned his offices, left the court, and withdrew to the monastery of Fontenelle, of which he became abbot: his wife also retired into a nunnery. After remaining seven years at Fontenelle, he left it about A.D. 823, and went to another monastery, but in 827, having received from Rome the relics of the martyrs Marcellinus and Petrus, he placed them in his residence at Mulinheim, which he converted into an abbey, which took afterwards the name of Seligenstadt, where he fixed his residence. ('De Translatione SS. martyrum Marcellini et Petri,' in the 'Acta Sanctorum' of Bollandus. The account is written by Eginhardt.) Eginhardt seems to have still repaired to court from time to time, when his advice was needed, and he appears by his own letters to have endeavoured to thwart the conspiracy of Louis's sons against that unfortunate monarch. He spent his latter years in retirement and study: according to one account he was still living in 848, when he attended the council of Mayence, but by others he is said to have died about 841. His wife had died before him, a loss by which he was greatly grieved, although they had lived separately for many years. Eginhardt wrote, 1, 'Vita et Conversatio gloriosissimi Imperatoris Karoli Regis magni,' divided into two parts, one relating to

the public and the other to the private life of his hero. It has gone through many editions, and has been also translated into various languages. The style is remarkably good for the times. 2, 'Annales Regum Francorum, Pipini, Karolomagni, et Ludovici Pii, ab anno 741 ad annum 820.' 3, 'Epistolæ,' which are found in Duchesne's 'Historiæ Francorum Scriptores,' vol. ii. These letters, of which only sixty-two have been preserved, show Eginhardt's character to great advantage, and afford considerable information on the manners of that period. 4, 'Breviarium Chronologicum ab orbe condito ad ann. D. 829,' which is an abridgment of Bede's Chronicle. There is a notice of Eginhardt by Duchesne, prefixed to his life of Charlemagne, in the collection already mentioned. There is also a life of Eginhardt by M. Teulet, prefixed to his edition, with a translation into French, of the works of Eginhardt, in 2 vols. 8vo, Paris, 1840.

EGMONT, Count of Lamoral, Prince of Gavre, a descendant of those dukes of Guelders who had signalized themselves against the house of Austria, was born in 1522 in Amsterdam. The fame of his ancestors is celebrated in the annals of his country, one of whom enjoyed, during the reign of Maximilian, the supreme magistracy of Holland.

Egmont's marriage with Sabina, duchess of Bavaria, reflected additional lustre upon his noble birth, and increased his influence by powerful alliances. In the year 1546 Charles V. conferred upon him the order of the Golden Fleece. Under this emperor he learned the art of war, and, being appointed by Philip II. commander of the cavalry, he gathered his first laurels in the fields of St. Quentin and Gravelingen (1557, 1558).

The Flemish people, chiefly occupied with commerce, and indebted for the preservation of their prosperity to these victories, were justly proud of their countryman, whose fame was spread through all Europe. The circumstances of Egmont being the father of a numerous family served also to increase their affection, and they saw with delight the prospect of this illustrious family being perpetuated among them.

Egmont's demeanour was courteous and noble; his open countenance was an index of the singleness of his mind; his life was one of mercy and philanthropy; far from being a bigoted Romanist, or a reckless reformer, he elevated himself above the contending parties, and laboured to bring about a peaceful reconciliation. It was only towards the close of his life, when all attempts to disarm the fury of the Spaniards against his Protestant countrymen had failed, that he showed himself willing to defend them against their oppressors. His motives however do not appear to have been any predilection for the Protestant doctrine, but pure love of justice, peace, and humanity.

A man possessed of such qualities, and enjoying so much popular influence, naturally awoke suspicion and jealousy in the hearts of the Spanish despots whenever the interests of the Flemish came into collision with those of the crown. Philip however, in order to conceal his dark designs against the supposed protectors of the religion of his rebellious subjects, on visiting Brabant gave to Egmont the government of Artois and Flanders, and exempted his estates from taxation. But upon his return to Madrid the tyrant changed his plans, and sent his favourite, Alva, to Flanders, with instructions to get rid of Egmont and his friend Count Horn.

In order to secure them both, Alva invited them to dinner, under the pretence of wishing to consult them on public affairs. When they had entered his private room, they were seized, and thrown into prison in Ghent, where they remained during nine months. At the expiration of this time they were carried to Brussels under an escort of ten companies of Spanish soldiers. Here Alva, invested with the power of captain-general and supreme judge, compelled the criminal court to pronounce Egmont guilty of high treason and rebellion, and to sentence him to be beheaded. This sentence was pronounced on the 4th of June 1568, without any substantial evidence, and was supported only by the depositions of his accusers. His estates were also confiscated. During his imprisonment the emperor of Germany, the knights of the Golden Fleece, the electors, the duchess of Parma, and his wife, used every possible exertion to save his life; but Philip was immovable. The sentence was executed on the 5th of June 1568, and both Egmont and Horn fell by the sword of the executioner on a scaffold erected in one of the principal squares of Brussels. Egmont died with courage, after having written a dignified letter to the king and a tender one to his wife.

He was but forty-six years of age. The people, who assembled in crowds to witness this mournful spectacle, were loud in their lamentations; they rushed towards the scaffold and dipped their handkerchiefs in the blood of the martyrs of Flemish independence. His friend, Count Horn, was executed immediately after him. Egmont's wife died the 19th of June 1568. It is said that the bishop of Ypres, a most pious and upright prelate, who had been deputed by Alva to prepare the two prisoners for their execution, after hearing the confession of Egmont, was so persuaded of his innocence that he went to Alva and begged him on his knees to suspend the execution. But Alva, besides his natural ferocity, bore a mortal enmity to Egmont on account of his military reputation, and rejected the bishop's intercession with insolent contempt. When Philip II. heard that these two noble lords had been executed he exclaimed, "I have caused these two heads to fall because the heads of such salmon are worth more

than many thousand frogs." But the perfidy of the monarch proved to be an ill policy. The judicial murder of Egmont and Horn exasperated the people beyond all endurance, and the revolt became general and irrepressible, and the last years of Philip were rendered miserable by the failure of all his efforts to restore his authority in the Netherlands.

The death of Egmont has supplied to Göthe an admirable subject for one of the best of his historical tragedies, for which Beethoven composed one of his finest overtures and some beautiful melodies to the songs interspersed through the play.

The latest life of Egmont is that by Clouet, 'Éloge historique du Comte d'Egmont,' Bruxelles, 1825.

* EHRENBERG, CHRISTIAN GODFREY, the celebrated German naturalist and microscopist, was born on the 19th of April 1795, at Delitzsch in Prussian Saxony. He received his early education at Schulpforte, and commenced the study of medicine at Leipzig in 1815. In 1817 he was called to Berlin by the law of military service. Here he became acquainted with the celebrated Hemprich, and afterwards accompanied him in his travels in the East. At Berlin Ehrenberg gave himself up to the study of organic life, and his first essay was 'On the Structure and Classification of the Fungi.' This paper appeared in the 'Annales des Botanique' of Schroeder, Sprengel, and Link in the year 1818. He took his degree of Doctor of Medicine the same year, taking as the subject of his inaugural thesis, 'Sylvæ Mycologię Berolinensium.' In this paper he described two hundred and forty-eight species of cryptogamic plants, sixty-two of which were new. In 1819 and 1820 he published other papers on cryptogamic botany, more especially one on the Flora of Ratisbon, in the 10th volume of the 'Memoirs of the Leopoldine Academy of Naturalists of Berne,' of which academy he had at that time been elected a member.

In April 1820 he embarked with his friend Hemprich on his travels in Egypt. They first visited Alexandria, and explored the coasts of Libya, and in 1821 visited Middle Egypt, especially the Pyramids. They arrived at Dongola in February 1822, where the governor was so much struck with the genius of M. Ehrenberg that he insisted on his giving him a plan of a fortress. The naturalist pleaded in vain his want of knowledge, and at last gave the plan of the fortress of Kasr-Dongola-el-Gedide, which to this day is the residence of the governor. Under the protection of the governor, the travellers penetrated as far as Ambukohl, in Upper Dongola. The travellers after returning to Cairo visited Sinai, the height of which mountain Ehrenberg accurately ascertained by means of the thermometer. Various scientific expeditions were made into Syria and Arabia, and Ehrenberg returned to Berlin in 1826. He lost however his friend Hemprich, who died of a fever at Massawa, an island in the Arabian Gulf. Berghaus has given to two groups of islands to the south and north of Dhalak the names of the islands of Hemprich and the islands of Ehrenberg.

On his return Ehrenberg was named one of the professors of the Faculty of Medicine, a position he still occupies. Soon after arranging his materials he commenced publishing his observations upon various departments of natural history. Besides a complete history of his travels he produced many monographs on various branches of natural history. The principal series was the 'Symbolæ Physicæ seu Icones et Descriptiones Animalium ex Itinere per Africam borealem et Asiam occidentalem,' &c., published at Berlin from 1828 to 1832. Another paper should be mentioned, 'On the Acalephs of the Red Sea,' in which he contributed largely to the existing knowledge of the *Medusa*. During his travels Ehrenberg made many observations, which have been published, on the useful plants growing in the districts which he visited.

In 1829 he accepted an invitation to join in the journey of Alexander von Humboldt into the Ural Mountains, an expedition which was prolonged into the Altai. It was during this journey that Ehrenberg's attention was more especially directed to the importance of investigations with the microscope. This instrument, which was gradually attracting attention, more especially through the important labours of our own countryman, Robert Brown [BROWN, ROBERT], became in his hands a mighty instrument of research. It would not be consistent with our present notice to refer to all Ehrenberg's papers on microscopic objects. Between sixty and seventy are referred to in Agassiz's 'Bibliography,' and probably as many more are extant. They are diffused throughout the transactions of the scientific societies and the pages of the scientific journals of Europe. When Ehrenberg commenced his labours, little had been done towards studying the structure of or classifying the organic beings whose existence could only be learned by the aid of the microscope. This instrument opened up to his view a new world, and if in his enthusiasm he too rapidly interpreted some of the phenomena, it should never be forgotten that Ehrenberg was the first to demonstrate the existence of the large mass of beings known as microscopic plants and animals. His observations, as far as they had gone, were published in his great folio work in 1838, entitled 'Die Infusionsthierehen als vollkommene Organismen an den Grenzen der Seh-Kraft.' This work comprised a general history, with a detailed account, of the structure of several hundred species of organic beings. He regarded these all as animals, and included them all in one group, which he called *Infusoria*. Since the publication of this work it has been shown that a portion of these

organisms, the Wheel-Animalcules [ROTIFERA, in NAT. HIST. DIV.], are much higher in organisation than the rest. His division *Polygastrica*, or many-stomached, has also been shown to be unfounded; whilst a large number of them have been demonstrated to belong to the vegetable kingdom. [INFUSORIA, DIATOMACEÆ, DESMIDÆ, in NAT. HIST. DIV.]

A very imperfect idea would be formed of Ehrenberg's labours from his great work on 'Infusorial Animalcules.' Since the publication of that work he has devoted himself with great success to the investigation of the fossil forms of microscopic organic beings, and shown that their siliceous and calcareous skeletons constitute a very important element in the constitution of many of the strata of the earth's surface. These researches he has also published in a large work entitled 'Micro-geologie.'

EICHHORN, JOHANN GOTTFRIED, an eminent professor of oriental and biblical literature in the University of Göttingen, and one of the most learned and distinguished scholars of Germany, was born in October 1752 at Dorrenzimmern, in the principality of Hohenlohe Oeringen, and at first was rector of the school at Ohrdruf, in the principality of Gotha. Having applied with great success to the study of the oriental languages, he obtained in 1775 a professor's chair in the University of Jena, where he continued thirteen years, giving instruction in Hebrew, Arabic, &c., and was made in 1783 a court councillor by the Duke of Saxe-Weimar. In 1788 he was appointed to the professorship previously held by Michaelis in the University of Göttingen, of which institution he continued a very distinguished ornament during the remainder of his life, as professor of oriental and biblical literature.

His reputation was equally high as a proficient in oriental, classical, and scriptural antiquities; in philosophical criticism; in the history of nations, and of ancient and modern literature and science; and in universal bibliography. He was made in 1811 a doctor of divinity; in 1813 the directorship of the Royal Scientific Society of Göttingen was conferred on him, and he received the appointment of pro-rector of the University of Göttingen; in 1819 he was appointed privy councillor of justice for the kingdom of Hanover (Geheimer Justizrath). He died on the 25th of June 1827, at the age of seventy-five. In completing the present notice it is only necessary to enumerate the principal works of Eichhorn, and to give a brief and general account of his doctrines as a divine and a critic.

While at Jena, Eichhorn first displayed his knowledge of oriental literature in a history of East Indian commerce prior to the time of Mohammed ('Geschichte des Ostindischen Handels vor Mohammed'), Gotha, 1775. This was followed by a survey of the most ancient monuments of the Arabs ('Monumenta antiquissima Historiæ Arabum, post Schultensium collecta atque edita, cum animadversionibus'), Gotha, 1775; and a treatise on the ancient numismatical history of Arabia, Gotha, 1775. He next published a large collection of learned and valuable treatises, entitled a repository of biblical and oriental literature ('Repertorium für biblische und morgenländische Litteratur'), 18 vols., Leipzig, 1777-86. After removing to Göttingen he devoted his attention almost exclusively to the archaeology of biblical literature, and the results of his studies appeared in a general repository of biblical literature ('Allgemeine Bibliothek der biblischen Litteratur'), 10 vols., 1788-1801; and in a disquisition on primitive history ('Urgeschichte'), 2 vols., Altdorf and Nürnberg, 1790-93, with an introduction and notes by the learned Gabler. This work contains a searching and bold criticism of the Mosaic Pentateuch. The two next are among the most important of the author's productions, namely, the introduction to the Old Testament ('Einleitung in das Alte Test'), of which he published a fourth and improved edition in 5 vols., at Gotha, in 1824; and the introduction to the New Testament ('Einleitung in das Neue Test'), new edition, in 2 vols., 1827. These were accompanied with an introduction to the apocryphal writings of the Old Testament ('Einleitung in die apokryphischen Schriften des Alten Test'), Leipzig, 1795, Göttingen, 1798; and a revised and uniform edition of the three, with the title of critical writings ('Kritische Schriften'), was published at Leipzig in 7 vols., 1804-14.

The other works of Eichhorn on biblical criticism and philology are a commentary on Revelations ('Commentarius in Apocalypsin Joannis'), 2 vols., Göttingen, 1791; a revised and enlarged edition of Professor Simon's Hebrew and Chaldaic Lexicon, Halle, 1793; a critical translation and exposition of the writings of the Hebrew prophets ('Die Hebräischen Propheten'), 3 vols., Göttingen, 1816-20; commentaries on the prophetic poetry of the Hebrews ('Commentationes de Prophetica Poesi Hebræorum'), 4to, Göttingen, 1823; preface to the 'Nova Bibliotheca Hebraica' by Koecherus; and numerous critical treatises in a learned periodical work entitled 'Mines of the East' ('Fundgruben des Orients'), and in the Commentaries of the Göttingen Royal Society of Sciences ('Commentarii Societatis Reg. Scientiarum Göttingensis').

In 1796 he published the plan of a comprehensive history of arts and sciences from their revival in Europe to the end of the 18th century, and wrote as a part of the work a general history of civilisation and literature in modern Europe ('Allgemeine Geschichte der Cultur und Litteratur des neuern Europa'), 2 vols., Göttingen, 1796-99. The 'History of Modern Poetry and Eloquence' by Bouterwek, and the 'History of Military Science' by Hoyer, constituted other parts of the undertaking, which was left unfinished. The first three parts, and

the fifth part, of a similarly extensive and uncompleted work, were written by Eichhorn, namely, the history of literature, ancient and modern, from its commencement to the present time ('Geschichte der Litteratur von ihrem Ursprunge bis auf die neuesten Zeiten'), 6 vols., Göttingen, 1805-11. He also wrote literary history ('Literargeschichte'), 2 vols., Göttingen, 2nd edition, 1813-14; a history of all parts of the world during the last three centuries ('Geschichte der drey letzten Jahrhunderte,' &c.), 6 vols., Göttingen, 3rd edition, 1818; an historical survey of the French revolution ('Uebersicht der franz. Revolution'), 2 vols., Göttingen, 1797; and a universal history ('Weltgeschichte') on the plan of Gatterer's universal statistics ('Weltstatistik'), 4 vols., Göttingen, 3rd edition, 1818-20. The two following laborious and judicious compilations have obtained a high repute in the schools of Germany, namely, a history of ancient Rome, composed entirely of connected passages from the ancient Roman writers ('Antiqua Historia ex ipsis veterum script. Roman. narrationibus contexta'), 2 vols., Göttingen, 1811; and a history of ancient Greece, constructed on the same plan, from the ancient Greek historians ('Antiqua Historia,' &c.), 4 vols., Leipzig, 1812. His last historical work was a curious research on the early history of the illustrious house of the Guelphs, in which the ancestors of the present royal family of England are traced up to the middle of the 5th century ('Urgeschichte des erlauchten Hauses der Welfen, von 449-1055'), 4to, Hanover, 1817. From the year 1813 to his death in 1827, Professor Eichhorn was the editor of the Göttingen 'Literary Gazette' ('Göttingische gelehrte Anzeigen'). His critical writings display extensive and exact learning, which in his biblical treatises he employs for the development of doctrines often the reverse of those which are generally regarded as orthodox. Eichhorn applies to the Hebrew Scriptures the principles on which Heyne explained the mythology of the Greeks, and his name is conspicuous in the theological school commenced by Michaelis and Semler, and extended by Rosenmüller, Kuhnöl, Döderlein, Rohr, Teller, Schmidt, Henke, Ammon, Steinbart, Wegscheider, &c., as an ultra-rationalist, and a promoter of the system of logical religion and morality, founded on the Kantian transcendental theory of ideology, at that time so generally prevalent in the universities of Germany, and which in truth is a system of mere moral philosophy and philosophical theism, exhibited under the ostensible profession of Christianity; since all traditional doctrines and statements are made to give way to the operation of "abstract, universal, and eternal principles of reason." By his superior knowledge of oriental antiquities, and by his bold mode of thinking, Eichhorn established a new system of scriptural explication, in which he displays a degree of learned and philosophical scepticism much beyond that of his predecessor Michaelis. He denies all supernatural revelation to the Hebrew prophets, believing them to have been clever and experienced persons, who, from their peculiar abilities, were likely to foresee political and other events. He examines, questions, and rejects the authenticity of several books of the Old Testament, and of some of the epistles in the New Testament; and asserts generally that miraculous appearances, visions, voices, &c., are explainable by the laws of nature and the principles of human physiology and psychology, and that supernatural communications are chiefly referable to the mysterious traditions and superstitious notions common to all people in a state of ignorance and barbarism. His theory of the origin of the canonical gospels, which regards them as compilations from anterior documents, has been adopted by many subsequent critics. (See Dr. Schleiermacher's work on the 'Gospels.') Many of the sceptical positions of Eichhorn have been attacked in Germany by the anti-rationalist class of divines. On this point see 'The Present State of Protestantism in Germany,' by the Rev. Hugh Rose, 2nd edition, 1829, and the controversial publications which it elicited.

EICHHORN, CHARLES FREDERICK, son of the preceding, obtained considerable celebrity as an able and learned juriconsult. He was born at Jena on the 20th of November 1781; and after passing through the usual course of academic and legal training, was named in 1805 Professor of German Law at Frankfurt-on-the-Oder. In 1811 he removed to Berlin, and in 1817 to Göttingen, in each place holding the same chair as at Frankfurt. Ill-health however compelled him in 1823 to resign, and to retire to an estate he possessed near Tübingen. Having somewhat recovered, he was in 1831 again summoned to Berlin, and along with his professorship he received an appointment in the ministry of foreign affairs. At length in 1833 he resigned his professorship, and devoted himself entirely to his official duties and to writing. About this time he was made a member of the Prussian council of state, and of the commission of legislation. He died in July 1854.

Charles Eichhorn was one of the most erudite expounders of the ancient Germanic law, of its origin, its growth, and its various bearings. As the associate and fellow-labourer of Savigny, though taking a somewhat different branch of the subject as the main object of his investigations, and as holding the chair of German law for so many years, Eichhorn exercised an important influence on the study of law in Prussia. His principal writings are—'Deutsche Staats und Rechtsgeschichte,' 4 vols. 8vo, Göttingen, 1808-18, which work has passed through eight editions; 'Grundsätze des Kirchenrechts der Katholischen und Evangelischen Religionspartei in Deutschland,' 2 vols. 8vo, Göttingen, 1831-33; and 'Einleitung in das Deutsche Privatrecht mit Einschluss des Lehnrechts.' In conjunction with Savigny and

Goschen he also carried on the 'Zeitschrift für geschichtliche Rechtswissenschaft,' Berlin, 1815-1843.

EICHWALD, EDWARD, a Russian naturalist, was born at Mittau on the 4th of July 1795, and was educated in the gymnasium of that town till 1814, when he went to Berlin, where he studied medicine and natural history. In 1817 he began to travel, and visited Germany, Switzerland, France, and England. After residing at Wilna and Dorpat during the years 1819-23, he was appointed professor of zoology and midwifery in the university of Casan. Two years afterwards he undertook a scientific journey to the Caspian Sea, to the Caucasus, and into Persia. On his return in 1827 he was made professor of zoology and comparative anatomy in the university of Wilna, and again set out to investigate the western provinces of Russia as far as the Black Sea. The university of Wilna was suppressed, but Eichwald remained as secretary of the Medico-Chirurgical Academy there till 1838, when he removed to St. Petersburg as professor of mineralogy and zoology in the academy of that city. On receiving the appointment he undertook a new journey and traversed Esthonia, Finland, the government of St. Petersburg, and the Scandinavian provinces. In 1840 he made a geological journey through Italy, Sicily, and Algeria. The results of his journeys have been published in numerous works, of which the more important are—'Zoologia specialis,' 1829; 'Sketches of Natural History from Lithuania, Volhynia, and Podolia,' 1830; 'Plantarum novarum quas in Itinere Caspio-Caucasico observavit,' 1831-33; 'Memoria Bojani,' 1835; 'Treatise on the Mineral Wealth of the Western Provinces of Russia,' 1835; 'Ancient Geography of the Caspian Sea, of the Caucasus, and of the Southern Provinces of Russia,' 1838; 'On the Strata of the Silurian System of Esthonia,' 1840; 'Fauna Caspio-Caucasica,' 1846; 'Observations in Natural History during a Journey through the Tyrol,' 1851; 'The Paleontology of Russia,' 1851. Eichwald has been created a councillor of state by the Emperor of Russia, and he is member of a number of scientific societies.

ELAGABALUS, called also HELIOGABALUS, was the grandson of Mæsa, sister to the empress Julia, the wife of Septimius Severus. Mæsa had two daughters, Sémis, or Semiamira, the mother of Varius Avitus Bassianus, afterwards called Elagabalus, who was reported to be the illegitimate son of Caracalla and Mamma, mother of Alexander Severus. Elagabalus was born at Antioch A.D. 204. Mæsa took care of his infancy and placed him, when five years of age, in the temple of the Sun at Emesa to be educated by the priests; and through her influence he was made, while yet a boy, high priest of the Sun. That divinity was called in Syria 'Elagabal,' which name the boy assumed. After the death of Caracalla and the elevation of Macrinus, the latter having incurred by his severity the dislike of the soldiers, Mæsa availed herself of this feeling to induce the officers to rise in favour of her grandson, whom she presented to them as the son of the murdered Caracalla. Elagabalus, who was then in his fifteenth year, was proclaimed emperor by the legion stationed at Emesa. Having put himself at their head he was attacked by Macrinus, who at first had the advantage, but he and his mother Sémis, with great spirit, brought the soldiers again to the charge, and defeated Macrinus, who was overtaken in his flight and put to death A.D. 218. Elagabalus having entered Antioch, wrote a letter to the senate, professing to take for his model Marcus Aurelius Antoninus, a name revered at Rome: Elagabalus also assumed that emperor's name. The senate acknowledged him, and he set off for Rome, but tarried several months on his way amidst festivals and amusements, and at last stopped at Nicomedia for the winter. In the following year he arrived at Rome, and began a career of debauchery, extravagance, and cruelty, which lasted the remaining three years of his reign, and the disgusting details of which are given by Lamprius, Herodianus, and Dion. Some critics have imagined, especially from the shortness of his reign, that there must be some exaggeration in these accounts, for he could hardly have done in so short a time all the mischief that is attributed to him. That he was extremely dissolute and totally incapable is certain; and this is not to be wondered at, from his previous eastern education, his extreme youth, the corrupt example of his mother, his sudden elevation, and the general profligacy of the times. He surrounded himself with gladiators, actors, and other base favourites, who made an unworthy use of their influence. He married several wives, among others a vestal. The imperial palace became a scene of debauch and open prostitution. Elagabalus being attached to the superstitions of the East, raised a temple on the Palatine hill to the Syrian god whose name he bore, and plundered the temples of the Roman gods to enrich his own. He put to death many senators; he established a senate of women, under the presidency of his mother Sémis, which body decided all questions relative to female dresses, visits, precedence, amusements, &c. He wore his pontifical vest as high priest of the Sun, with a rich tiara on his head. His grandmother Mæsa, seeing his folly, thought of conciliating the Romans by associating with him as Cæsar his younger cousin, Alexander Severus, who soon became a favourite with the people. Elagabalus, who had consented to the association, became afterwards jealous of his cousin, and wished to deprive him of his honour, but he could not obtain the consent of the senate. His next measure was to spread the report of Alexander's death, which produced an insurrection among the prætorians, and Elagabalus having repaired to their camp to quell the mutiny, was murdered together

with his mother and favourites, and his body was thrown into the Tiber, March, A.D. 222. He was succeeded by Alexander Severus. [SEVERUS.] The coins of Elagabalus bear the names of Marcus Aurelius Antoninus, like those of Caracalla, with which they are often confounded. The names of Varius Avitus Bassianus, which he also bore before his elevation to the throne, are not found on his medals. He took the name of Varius from Sextus Varius Marcellus, who was his mother's husband.

Coin of Elagabalus.

British Museum. Actual size. Copper. Weight 380 grains.

ELDON, JOHN SCOTT, EARL OF, rose to the eminent station which he ultimately held from a humble beginning. All that is known about his ancestry is that his grandfather is reported by tradition to have been a clerk in the office of a coal-fitter at Newcastle, and a man of very good repute; he is described in a written document, of the year 1716, as William Scott, of Sandgate (one of the streets of that town), yeoman. His son, Mr. William Scott, the father of Lord Eldon, followed the business of what is called a coal-fitter, defined by his son's biographer to be "the factor who conducts the sales between the owner and the shipper, taking the shipper's order for the commodity, supplying the cargo to him, and receiving from him the price of it for the owner." In this line he prospered so much that at his death, at the age of seventy-nine, 6th November 1776, he appears to have left to his family, including what some of them had previously received from him, property to the amount of between thirty and forty thousand pounds. Mr. William Scott was twice married. By his first wife, Isabella Noble, who died January 1784, he had three children, all of whose descendants are extinct; by his second, Jane Atkinson, daughter of Henry Atkinson, Esq., of Newcastle, whom he married in August 1740, he had thirteen children, of whom the eldest son, William, afterwards Lord Stowell, was born in 1745, and of whom John, the future chancellor, was the eighth.

John Scott was born in 1751—as he believed, on the 4th of June—at his father's house in Love-lane, Newcastle, the site of which is now partly occupied by other smaller houses, partly taken in to widen Forster-street. He was educated, with his elder brothers, William and Henry, at the grammar school of his native place, commonly called the Head School, where the head master was the Rev. Hugh Moises, a respectable scholar and an excellent teacher, but one who did not spare the rod. William went to Oxford in 1761. [STOWELL, LORD.] It was their father's intention to bring up John to his own business; but when he was making arrangements for that purpose in 1768, William wrote home from Oxford, advising that he should be sent up to him: "I can," he said, "do better for him here." Accordingly, on the 15th of May of that year, he was entered a commoner of University College. On the 11th of July 1767, he was elected to a fellowship in his college, having then just completed his sixteenth year; he took his Bachelor's degree 20th February 1770; gained, in 1771, the chancellor's prize of 20*l.* for an English prose essay on 'The Advantages and Disadvantages of Foreign Travel' (published in 'Talbot's Collection of the Oxford English Prize Essays,' 1830); but forfeited his fellowship by running off, on the 18th of November 1772, with Miss Elizabeth Surtees, daughter of Aubone Surtees, Esq., banker of Newcastle, whom he married at Blackhills, in Scotland, the next day. The lady's father was very angry; and it was some little time before he was reconciled; but at last he agreed to give his daughter a portion of 1000*l.*, Mr. Scott making over to his son an equal sum. Meanwhile, it is said, a grocer of Newcastle, a friend of the family, who was well to do in the world, had kindly offered to take the young man into partnership; and it was only another interference of his older brother William which prevented the father closing with this proposal. It was then determined that he should enter into holy orders if a University College living fell vacant during the twelve months of grace, as they are called, for which he was still allowed to hold his fellowship; that event did not happen, and he then made up his mind, it is said with some reluctance, to try the profession of the law. He had entered himself a student of the Middle Temple in January 1773; and he took his degree of Master of Arts on the 13th of February in the same year.

During the years 1774 and 1775 he held the office of a tutor of University College, where his brother William was at the time senior tutor; but it is believed that all he did in that capacity was to attend to the law studies of some of the members of the college. He received none of the emoluments of the office. One or both of these

years also he read the law lectures, as deputy for Sir Robert Chambers, the Vinerian professor; and for this service he had 60*l.* a year. Awkwardly enough, the first lecture he had to read was upon the statute 4 and 5 Phil. and M., c. 8, "Of young men running away with maidens;" and it so chanced that he had to deliver it immediately after it was put into his hands, and without knowing a word that was in it. "Fancy me reading," he said, when telling the story long afterwards, "with about 140 boys all giggling at the professor. Such a tittering audience no one ever had."

Mr. Scott was called to the bar on the 9th of February 1776, on which he came up with his wife to London, and took a small house in Cursitor-street, from which he soon after removed to another in Carey-street. He naturally joined the Northern Circuit; but it was, as usual, some time before he began to make much by his practice. Indeed after a trial of two or three years his prospects of success in London seemed so unpromising, that he had made arrangements for settling as a provincial counsel in his native town, when, in July 1778, he was brought into considerable notice by his argument in the cause of *Ackroyd v. Smithson* (1 Bro. C. C. 503), heard before Sir Thomas Sewell, Master of the Rolls; and he obtained still more repute when Sir Thomas's judgment, which was adverse to his client, was reversed in March 1780, by Lord Chancellor Thurlow, in accordance with Scott's reasoning, which has decided all similar questions ever since. The question was what should be done with one of a number of shares into which a testator had directed that the money obtained by the sale of his real estates should be divided, the party to whom he had given the share by his will having died in the testator's lifetime. Mr. Scott contended that the share, being land, at the death of the testator came to the heir-at-law. Even for some time after this success however he still retained the idea of settling in Newcastle; and had actually made a house be taken for him in that town, of which he had also accepted the Reordership. One year, apparently 1780, he did not go the circuit, because he could not afford it; he had already, to use his own words, borrowed of his brother for several circuits, without getting adequate remuneration. But when matters were in this state he unexpectedly found such an opportunity of distinguishing himself in an election case (that of Clitheroe) before a committee of the House of Commons as at once changed his position, and with that his plans for the future. Having been applied to in the absence of the counsel who was to have led, Mr. Scott, upon the refusal of the next counsel to lead because he was not prepared, was persuaded to take the conduct of the case at a few hours' notice. It lasted for fifteen days. "It found me poor enough," said he, relating the circumstances in his old age, "but I began to be rich before it was done: they left me fifty guineas at the beginning; then there were ten guineas every day, and five guineas every evening for a consultation—more money than I could count. But, better still, the length of the cause gave me time to make myself thoroughly acquainted with the law." He was beaten in the committee by one vote; but the ability he had shown did not the less establish his reputation.

All thought of leaving London was now abandoned; his practice from this time increased rapidly; and in June 1783, on the formation of the coalition ministry of Lord North and Mr. Fox, and the great seal on Lord Thurlow's resignation being put into commission, he was one of several junior counsel who were called within the bar. Erskine was another; and it was at first intended to give precedence to him and Mr. Pigott, both of whom were Scott's juniors; but to this arrangement the latter firmly refused to submit; and his patent, as ultimately drawn out, gave him precedence next after the king's counsel then being, and after Harry Peckham, who had been made one a few days previously, and had been placed before Erskine, though Erskine's patent was of earlier date. A few days after he received this promotion, he was made a bencher of his Inn of Court.

About the same time he was returned to parliament for the borough of Weobly, through the patronage of Lord Weymouth, with whom however he stipulated that he should not be expected uniformly, or as a matter of course, to represent his lordship's opinions. The election took place on the 16th of June. He and Erskine both made their maiden speeches in the same debate, that on the 20th of November, about a week after the opening of the session, on a motion connected with the famous India Bill, which eventually upset Fox's government. The two young lawyers were however on opposite sides—Erskine with ministers, Scott with Pitt and the party destined soon after to come into power. The Coalition ministry was turned out on the 18th of December; and on the 24th of March 1784, the king prorogued, and the next day dissolved parliament, after the opposition to Pitt and the new government had been gradually brought down in the course of a long series of divisions to a majority of one. Mr. Scott was again returned for Weobly; and in the new parliament he took a prominent part in most of the legal questions that came before the House. In the session of 1785, on the 9th of March, he spoke and voted with Fox against ministers on one of the questions connected with the great Westminster scrutiny; and his speech was considered to have established the doctrine "that the election must be finally closed before the return of the writ, and that the writ must be returned on or before the day specified in it." This principle the government soon after consented to enact as law by the statute 25 Geo. III. c. 84, "To limit the duration of polls and scrutinies."

In March 1787 Mr. Scott was appointed chancellor of the bishopric and county palatine of Durham, by the bishop, who was a brother of Lord Thurlow, and had just been translated to the see. In June 1788, on Lord Mansfield's resignation and the appointment of Sir Lloyd Kenyon as his successor in the chief-justiceship of the King's Bench, the attorney-general, Mr. Pepper Arden, was made master of the rolls, in room of Kenyon; the solicitor-general, Sir Archibald Macdonald, became attorney-general; and the office of solicitor-general was conferred on Scott. At the same time he was also knighted. A few days afterwards he was re-elected for Weobly; and he was a fourth time returned for the same place to the new parliament which met in November 1790. He held the office of solicitor-general till February 1793, when he was made attorney-general on the promotion of Sir Archibald Macdonald to the place of Chief Baron of the Exchequer. On this occasion he was returned a fifth time for Weobly. To the next parliament, which met in September 1796, the last in which he sat as a member of the House of Commons, he was returned, along with Sir Francis Burdett, for the Duke of Newcastle's borough of Boroughbridge.

The period of Sir John Scott's tenure of the office of attorney-general extends to the year 1799. It is memorable for the state trials connected with the political excitement produced in this country by the breaking out of the French Revolution. Muir, Palmer, Skirving, Margat, and Gerald, had all been convicted of sedition in Scotland, and sentenced to fourteen years transportation, when in October 1794, Hardy, Horne Tooke, Thelwall, Holcroft, and their associates, were indicted for high treason at the Old Bailey. Only Hardy, Tooke, and Thelwall were tried; all three were acquitted; and the prosecutions against the other prisoners were dropped. There has been much difference of opinion as to the wisdom of the course taken by the government on this occasion, but perhaps too much stress has commonly been laid on the single fact that none of the trials issued in a conviction. There can be no doubt that the evidence, although it was held insufficient to support the charge of high treason, produced an immense effect upon the public mind; and the accused were dismissed from the bar unharmed, but to a great extent disarmed. The attorney-general naturally came in for a principal share of the obloquy which the proceedings excited; but his demeanour in the conduct of the trials was admitted on all hands to have been characterised by moderation and good temper. His answer to the question so often asked,—Why he had not prosecuted for a misdemeanour? always was, that in his deliberate opinion the offence was treason or nothing; but he never could get over the next question, How could anyone expect a jury to convict of treason, when it required a speech of eleven hours to state the charge? In his own written account however, as quoted by Mr. Twiss from the *Anecdote-Book*, vol. i. pp. 282-86, he lays the principal stress upon the desirableness of bringing out all the evidence. His words are, "The mass of evidence, in my judgment, was such as ought to go to the jury for their opinion, whether they were guilty or not guilty of treason. Unless the whole evidence was laid before the jury, it would have been impossible that the country could ever have been made fully acquainted with the danger to which it was exposed; . . . and it appeared to me to be more essential to securing the public safety that the whole of their transactions should be published, than that any of these individuals should be convicted."

In July 1799, on the death of Sir James Eyre, chief justice of the Common Pleas, Sir John Scott claimed and obtained that office, agreeing at the same time to go into the House of Lords. His title of Baron Eldon was taken from a manor of that name, consisting of above 1300 acres, in the county of Durham, which he had purchased for 22,000*l.* in 1792. It appears from Lord Eldon's fee books, as far as they have been preserved, that his annual receipts when at the bar had been in 1785, 6054*l.*; in 1786, 6833*l.*; in 1787, 7600*l.*; in 1788, 8419*l.*; in 1789, 9559*l.*; in 1790, 9684*l.*; in 1791, 10,213*l.*; in 1792, 9080*l.*; in 1793, 10,330*l.*; in 1794, 11,592*l.*; in 1795, 11,149*l.*; in 1796, 12,140*l.*; in 1797, 10,961*l.*; and in 1798, 10,557*l.* His removal to the bench was a great sacrifice of income, but he considered that his health and comfort required his retirement from the laborious office of attorney-general. His claim however was at first opposed by both Pitt and Loughborough the chancellor, who were desirous of giving the office to Sir R. Pepper Arden, then master of the rolls.

When it became known that Sir John Scott was to be the new chief justice of the Common Pleas, Lord Kenyon, then chief justice of the King's Bench, publicly congratulated the profession upon the appointment of one, who, he said, would probably be found "the most consummate judge that ever sat in judgment;" and Lord Eldon proved an admirable common law judge. "On the bench of a common law court," it is remarked by his biographer, "no scope was allowed to his only judicial imperfection, the tendency to hesitate. . . . Compelled to decide without postponement, Lord Eldon at once established the highest judicial reputation; a reputation indeed which afterwards wrought somewhat disadvantageously against himself when lord chancellor, by showing how little ground there was for his diffidence, and consequently how little necessity for his doubts and delays." He was also much attached to his office, and to the end of his life used to express the strong regret with which he had left the Court of Common Pleas.

But on Lord Loughborough's resignation of the great seal in April 1801, about a month after Mr. Pitt had been succeeded as prime minister by Mr. Addington, Lord Eldon became lord chancellor (April 14th). His own account was, that when he was made chief justice of the Common Pleas, the king had insisted upon his giving a promise, that whenever he should be called upon to take the office of chancellor he would do so. He continued to hold this office till the 7th of February 1806, when, on the accession of the Whig ministry of Mr. Fox and Lord Grenville, he was succeeded by Lord Erskine; he resumed it on the 1st of April 1807, on the return of his party to power; and he finally resigned it on the 30th of April 1827, when Mr. Canning became prime minister, and the great seal was given to Lord Lyndhurst. He was raised to the dignities of Viscount Encombe and Earl of Eldon in 1821.

Lord Eldon's judicial character has been elaborately drawn by several competent pens. The reader may be especially referred to the volumes of his biographer, Mr. Twiss; to a series of articles in the 'Law Magazine,' Nos. 41 to 44 inclusive; to the second series of Lord Brougham's 'Historical Sketches of Statesmen who flourished in the time of George III. ;' and to Lord Campbell's 'Lives of the Chancellors.' It is admitted on all hands that in legal learning he never had a superior, if he had an equal, in Westminster Hall; and, although his intellect was not capacious, nor his general powers of mind of a commanding order, in the acuteness and subtlety with which he applied his professional knowledge he was perhaps unrivalled by any judge that ever sat upon the bench. The great fault that is imputed to him is the hesitation which he showed in coming to a decision, or at any rate, as has been said to have been rather the case, in pronouncing one. But this habit, however distressing to individual suitors, was not so permanently mischievous as might be feared. Indeed the anxious consideration with which his judgments were formed enhances their value and authority.

During nearly all the time that Lord Eldon sat on the woolsack he took a leading part in the general debates of the House of Lords; he was also understood to be one of the most influential members of the cabinet; and he was certainly one of the staunchest and most uncompromising supporters of all the great principles of the old Tory or Conservative party. The two great measures of Parliamentary Reform and Roman Catholic Emancipation in particular were steadily opposed by him on all occasions, and to the last. Indeed it was his inflexibility on the latter question that occasioned his final retirement from office.

Opinions will of course be divided on Lord Eldon's character as a public man. The facts of his long career are now generally known; and sufficient time has elapsed to enable the present generation to form a tolerably correct estimate of the men who directed affairs in the eventful period of the latter part of the reign of George III. and the regency. So much we may affirm without incurring the imputation of judging in a mere party spirit; that the reputation of Lord Eldon as a profound lawyer will be permanent, while his career as a statesman was not marked by any measure that places him among the great men of his age or country.

Lord Eldon survived in retirement till the 18th of January 1838, and was succeeded in his peerage by his grandson, the late earl, the son of his eldest son John, who was born at Oxford on the 8th of March 1774, and died on the 24th of December 1805. Lord Eldon's other children were Elizabeth, born in 1788, who married George Stanley Repton, Esq.; Edward William, born in 1791, and Henry John, born in 1798, who both died in infancy; William Henry John, born in 1795, who died in 1832; Frances Jane, born in 1798, who married the Rev. Edward Bankes, rector of Corfe Castle and prebendary of Gloucester and Norwich, and died in 1838. Lady Eldon died in 1831. John, second earl of Eldon, was declared of unsound mind in 1858, and died in September 1864. His son John, the present earl, was born in 1845, and succeeded to the title on the death of his father.

(*The Public and Private Life of Lord Chancellor Eldon, with Selections from his Correspondence*, by Horace Twiss, Esq., one of her Majesty's Counsel, 3 vols. 8vo, Lond., 1844.)

ELGIN, EARL OF. THOMAS BRUCE, seventh earl of Elgin and Kincardine, was descended from the royal family of Bruce, and was born in 1777. After having passed some years at Harrow and Westminster, he went to the University of St. Andrews; thence he proceeded to Paris, where he studied law; and he afterwards prosecuted military studies in Germany. He subsequently entered the army, in which he rose gradually to the rank of general. The greater part of his life however was spent in diplomatic posts. He was appointed envoy at Brussels in 1792, and accompanied the Prussian army during its operations in Germany in the following year. In 1796 he was sent to Berlin as envoy extraordinary, and in 1799 to Constantinople in the same capacity. Here he continued until the French were driven out of Egypt in 1802. On his appointment to the embassy to Turkey it had been suggested to him as desirable to obtain some better knowledge of the remains of art at Athens than then existed. Lord Elgin submitted the proposition to the British government, but it was not encouraged. On his way however he stopped at Palermo, where he was persuaded by Sir William Hamilton to pursue the design, and accordingly he engaged six artists at his own expense,

who reached Athens in August 1800, and they were eventually able to secure and to bring over to England a large number of casts, monuments, statues, bas-reliefs, medals, and fragments of architecture of the best age of Athenian art. In spite of considerable censure and opposition, in 1816 the collection was purchased by the government, and placed in the British Museum, where it is known as the 'Elgin Marbles.' From this time forward Lord Elgin held no public appointment. He was a Scotch representative peer for fifty years, but, except when employed as a diplomatist, he lived a very private and retired life. He died at Paris, in November 1841.

* ELGIN, EARL OF. JAMES BRUCE, eighth earl of Elgin and Kincardine, son of the preceding nobleman, was born in 1811, and received his early education at Eton, and at Christchurch, Oxford, where he graduated B.A. in 1833, as a first class in classical honours. He was subsequently elected Fellow of Merton College. In 1841 he was chosen one of the representatives for Southampton, but succeeded to the Scottish earldom on his father's death before the close of the year. In 1842 he was appointed governor of Jamaica, and held that post for four years. The ability which he here displayed induced the existing government to select him as successor of Lord Cathcart in the still more arduous post of governor-general of Canada, whither he proceeded in 1846. Here his policy was liberal and enlightened, and correspondingly popular. He carried out the principles of administration recommended by the late Earl of Durham, by cherishing a representative system and self-government. Maintaining a dignified neutrality among the extremes of contending parties in Canadian politics, he interested himself in the development of the agricultural and commercial resources of the province, and especially in its export manufactures, thus securing the good opinion at once of the colonists themselves and of more than one ministry at home. In 1849 he was rewarded with an English peerage, and the lord-lieutenancy of Fife-shire was conferred upon him in 1854. He has been twice married; his present wife is a daughter of the first earl of Durham.

ELI, the High Priest of the Jews, who succeeded Samson as judge of Israel, or, as is generally supposed, was his colleague for the last twenty years of his government. He was the first high priest of the race of Ithamar, the second son of Aaron—the race of Eleazar, which was not extinct, being for some reason superseded, and it was not restored till the time of Solomon, who expelled Abiathar, and appointed Zadok, of the elder race, in his place. Eli flourished, according to Hales, about B.C. 1182, and his government endured for about thirty years. He was a good and pious man, but deficient in firmness. We first hear of him in the first book of Samuel, when he mistook the fervour of Hannah for drunkenness, as she prayed for issue in the temple. But she remonstrated, "Count not thine hand-maid for a daughter of Belial; for out of the abundance of my complaint and grief have I spoken hitherto:" and Eli blessed her, saying, "Go in peace; and the God of Israel grant thee thy petition that thou hast asked of him." As Eli advanced in years he delegated much of his power to his two sons, Hophni and Phinehas. They were dissolute and violent young men, who not only abstracted the sacrifices brought to the temple, but were guilty of other enormities, so that "men abhorred the offering of the Lord." A prophet was sent, who told Eli of the misconduct of his sons, and denounced vengeance upon their crimes. This seems to have been ineffectual in restraining them, for, still later, "when his eyes began to wax dim, and he could not see," Samuel was commissioned to announce to him that his house would be judged, "because his sons made themselves vile, and he restrained them not;" to which he answered, "Let the Lord do what seemeth him good." A war with the Philistines occurred shortly afterwards, and the Israelites were defeated at Eben-essur, whereupon they fetched the ark from Shiloh, and it was accompanied by Hophni and Phinehas. Another battle took place; the ark was captured; and Hophni and Phinehas were slain, together with thirty thousand Israelites. On learning this disastrous news, Eli fell back from his chair and broke his neck, at the age of ninety-eight. He was succeeded as judge by Samuel, who held the office until the nomination of Saul as king.

* ELIE DE BEAUMONT, JEAN-BAPTISTE-ARMAND-LOUIS-LÉONCE, was born at Canon, in the department of Calvados, on the 25th of September, 1798. He was educated at the Lycée Henri IV., where he gained the first prize in mathematics in 1817, and with it the privilege of entering the École Polytechnique. On quitting this in 1819 he studied for two years in the École des Mines, and then commenced the series of mineralogical and geological travels that have given him renown. In 1823, in company with M. Dufrenoy, he visited England and Scotland. In 1825, again in conjunction with M. Dufrenoy, he prepared a geological chart of France on a large scale. From this time his studies have been chiefly devoted to geology, although in January 1852 he was nominated by the President to a seat in the Senate, but M. de Beaumont has always abstained from politics. His chief works are 'Coup d'œil sur les Mines,' 1824; 'Observations Géologiques sur les différentes Formations qui, dans le Système des Vosges, séparent la Formation Houillère de celle du Lias,' 1829; 'Sur la Constitution Géologique des Îles Baléares,' 1829; 'Recherches sur quelques-unes des Révolutions de la Surface du Globe,' 1829; 'Leçons de Géologie,' 1845. M. de Beaumont was elected a foreign member of the Royal Society of London in 1835; he is also a member of several

other scientific societies; and on the death of Arago in 1853 he succeeded him as perpetual secretary to the Académie des Sciences.

ELIOT, JOHN, often called the 'Apostle of the Indians,' was a native of England, born in 1604. He was educated at the University of Cambridge, and distinguished himself by proficiency in theology and in ancient languages. Having seceded from the established church and embraced the ministry, he emigrated, like many other sufferers for conscience, to New England, and arrived at Boston in 1631. In the following year he married, and finally established his abode at Roxbury, only a mile distant, as minister of a small congregation, composed chiefly of friends to whose religious service he had previously engaged himself, in case they should follow him across the Atlantic. In discharging the duties of his function he was zealous and efficient; and he was also earnest in spreading the blessings of education, by promoting the establishment of schools. One of his occupations was the preparing, in conjunction with Richard Mather and another minister named Wilde, a new metrical version of the Psalms for congregational use.

Having qualified himself, by learning their language, to become a preacher to the Indians, he commenced his missionary labours on the 28th of October 1646, before a large assemblage collected by his invitation on the site of what is now the town of Newton, a few miles from Roxbury. Many, it is said, on this and on a subsequent occasion seemed deeply touched; and it is evident, by the questions asked of the preacher, that the understandings as well as the feelings of his audience, were roused. From the chiefs and priests, or medicine-men, both of whom felt interested in maintaining ancient manners and superstitions, he usually met with opposition. Still no small number were converted: and these, abandoning their savage life, united in communities, to which lands were granted by the provincial government. In 1674 there were seven Indian 'praying-towns,' containing near 500 persons, thus settled in Massachusetts, under the care of Eliot, besides a still greater number of converts, to whom land had not been thus assigned.

In travelling among the woods Eliot underwent great physical labour and hardship, and his mental labour was unremitting. He translated the Old and New Testament, and several religious treatises, into the Indian tongue, which were printed for distribution chiefly at the expense of the Society for Propagating the Gospel; he composed an Indian grammar, and several treatises on subjects not directly religious, for the use of his converts and pupils, and also wrote a number of English works. Nevertheless, he lived to the age of eighty-six, and resigned his pastoral charge at Roxbury only two years before his death, which took place on the 20th of May 1690. A colleague had been appointed to assist him in 1650, in consequence of his necessary and frequent absence. His private character appears to have been very beautiful: he was not only disinterested and zealous, but benevolent, self-denying, and humble. Baxter says, in one of his letters, "There was no man on earth whom I honoured above him." A handsome memorial to the 'Apostle of the Indians, and the pastor for fifty-eight years of the first church in Roxbury,' has been erected in the picturesque 'Forest Hills Cemetery,' Roxbury.

(Cotton Mather, *Ecc. Hist.*, b. iii., and *Life of John Eliot*. A modern *Life of John Eliot*, Edinburgh, 12mo, 1823, contains a good deal of information concerning the early attempts to convert the Indians.)

ELIOTT, GEORGE AUGUSTUS, LORD HEATHFIELD, was born at Stobbs in Scotland in 1718. He studied the mathematics and other sciences at Edinburgh, and afterwards went to the University of Leyden, where he made great proficiency in classical literature, and was remarkable for the elegance and fluency with which he spoke the French and German languages. His knowledge of tactics was acquired in the celebrated school at La Fère. Having attained the rank of lieutenant-colonel, he accompanied George II. to Germany in 1743 as his majesty's aide-de-camp, and was wounded in the battle of Dettingen. In the Seven Years War, he fought in 1757 under the Duke of Cumberland and Prince Ferdinand of Brunswick, and greatly distinguished himself at the head of his celebrated regiment of light-horse, raised and formed by himself, and called by his name. He was second in command in the expedition against the Havannah, the capture of which important place was highly honourable to the courage and perseverance of the British troops. After the peace he obtained the rank of lieutenant-general, and was appointed in 1775 to the government of Gibraltar. His memorable defence of that important fortress against the combined efforts of France and Spain was the last exploit of his life, the splendour of which so far eclipsed all that had preceded it, that he is most familiarly known as 'the gallant defender of Gibraltar.' This last and most memorable of all the sieges of Gibraltar was commenced in 1779, and did not terminate till the 2nd of February 1783. For a detailed account of the siege the reader is referred to the interesting work of Captain John Drinkwater and M. Bourgoing, to the 'Life of General George Augustus Elliott (afterwards Lord Heathfield),' and to chap. lxiv. of Malvón's 'History of England.' The conduct of the governor and brave defender of Gibraltar throughout forms one great example of moral virtue and military talent. The grand attack took place on the 13th of September 1782. On the land side, besides stupendous batteries mounting 200 pieces of heavy ordnance, there was an army of 40,000 men, commanded by a victorious general, the Duc de Crillon, and

animated by the immediate presence of two princes of the crown of France. In the bay lay the combined fleets of France and Spain, consisting of 47 sail-of-the-line, numerous frigates and smaller armed vessels, besides 10 battering ships, which alone had cost upwards of 500,000*l.* Four hundred pieces of the heaviest artillery (reckoning both sides) were playing at once. The battering ships were found to be of so formidable a construction that the heaviest shells rebounded from them. Eventually however two of them were destroyed by the incessant discharge of red-hot shot from the garrison, and the remaining eight were burnt by the enemy to prevent them from falling into the hands of the besieged. The remainder of the enemy's squadron also suffered considerably; but notwithstanding their failure the assailants kept up a less vivid fire for more than two months, and the siege did not finally terminate till the 2nd of February 1783, when it was announced that the preliminaries of a general peace had been signed. The expenditure of the garrison exceeded 8300 rounds (more than half of which were hot balls), and 716 barrels of powder. That of the enemy could not be ascertained, but their loss, including prisoners, was estimated at 2000, while that of the garrison only amounted to 16 killed and 68 wounded. While the floating batteries were on fire a detachment of British marines under Brigadier Curtis, was humanely and successfully employed in rescuing numbers of the enemy from their burning citadels. The failure of this memorable attempt to wrest Gibraltar from the possession of England has been partly attributed to a want of co-operation among the enemy's forces, but the principal cause was, no doubt, the gallant defence made by General Elliott and his brave garrison, notwithstanding their frequent and extreme suffering from want of provisions and from the prevalence of disease.

After the peace General Elliott was created a peer by the title of Lord Heathfield of Gibraltar. His lordship died at his favourite country seat Kalkofen, near Aix-la-Chapelle, whither he had gone in 1790, in the seventy-third year of his age.

ELIZABETH, Queen of England, the daughter of Henry VIII. by his second wife, Anne Boleyn, was born at Greenwich, 7th of September 1533. She was not three years old therefore when her mother was brought to the block in May 1536. Very soon after her birth it was declared, by the Act 25 Henry VIII., c. 22, that if Queen Anne should decess without issue male, to be begotten of the body of the king, then the crown, on the death of the king, should go "to the Lady Elizabeth, now princess, and to the heirs of her body lawfully begotten." By this act therefore Henry's female issue by his present queen was placed in the order of succession before the male issue he might have by any future wife. By the 28 Henry VIII., c. 7, however, passed after his marriage with Jane Seymour, his two former marriages were declared to be unlawful and void, and both Elizabeth and her elder sister Mary were bastardised. But finally, by the 35 Henry VIII., c. 1, passed soon after his marriage with his last wife, Catharine Parr, it was declared that if Prince Edward should die without heirs, then the crown should remain first to the Lady Mary, and, failing her, to the Lady Elizabeth. This was the last legal settlement of the crown, by which her position was affected, made previous to Elizabeth's accession; unless indeed she might be considered to be excluded by implication by the Act 1 Mary, st. 2, c. 1, which legitimatised her sister Mary, declared the validity of Henry's first marriage, and pronounced his divorce from Catherine of Aragon to be void.

In 1535 a negotiation was entered into for the marriage of Elizabeth to the Duke of Angoulême, the third son of Francis I. of France; but it was broken off before any agreement was come to. In 1546 also Henry proposed to the Emperor Charles V., with the view of breaking off a match then contemplated between the emperor's son, the prince of Spain, afterwards Philip II., with a daughter of the French king, that Philip should marry the Princess Elizabeth; but neither alliance took place. Elizabeth's next suitor, though he does not seem to have formally declared his pretensions, was the protector Somerset's unfortunate brother, the Lord Seymour of Sudley. He is said to have made some advances to her even before his marriage with Queen Catharine Parr, although Elizabeth was then only in her fourteenth year. Catharine, who died a few months after her marriage (poisoned, as many supposed, by her husband), appears to have been made somewhat uncomfortable while she lived by the freedoms the princess continued to allow Sudley to take with her, which went beyond ordinary flirtation; the scandal of the day indeed was, that "the Lady Elizabeth did bear some affection to the admiral." After his wife's death he was accused of having renewed his designs upon her hand; and it was part of the charge on which he was attainted that he had plotted to seize the king's person and to force the princess to marry him; but his execution in the course of a few months stopped this and all his other ambitious schemes.

In 1550, in the reign of Edward VI., it was proposed that Elizabeth should be married to the eldest son of Christian III. of Denmark; but the negotiation seems to have been stopped by her refusal to consent to the match. She was a favourite with her brother, who used to call her his 'sweet sister Temperance;' but he was nevertheless prevailed upon by the artful and interested representations of Dudley to pass over her, as well as Mary, in the settlement of the crown which he made by will a short time before his death. [EDWARD VI.]

Camden gives the following account of the situation and employments of Elizabeth at this period of her life, in the introduction to his history of her reign. She was both, he says, "in great grace and favour with King Edward, her brother, as likewise in singular esteem with the nobility and people; for she was of admirable beauty, and well deserving a crown, of a modest gravity, excellent wit, royal soul, happy memory, and indefatigably given to the study of learning; inasmuch, as before she was seventeen years of age she understood well the Latin, French, and Italian tongues, and had an indifferent knowledge of the Greek. Neither did she neglect music, so far as it became a princess, being able to sing sweetly, and play handsomely on the lute. With Roger Ascham, who was her tutor, she read over Melancthon's 'Common-Places,' all Tully, a great part of the histories of Titus Livius, certain select orations of Isocrates (whereof two she turned into Latin), Sophocles's Tragedies, and the New Testament in Greek, by which means she both framed her tongue to a pure and elegant way of speaking, &c." ('English Translation in Kennet's Collection.')

It appears from what Ascham himself tells us in his 'Schoolmaster' that Elizabeth continued her Greek studies after she ascended the throne: "After dinner" (at Windsor Castle, 10th December 1558), he says, "I went up to read with the Queen's Majesty: we read there together in the Greek tongue, as I well remember, that noble oration of Demosthenes against Æchines for his false dealing in his embassy to king Philip of Macedonia."

On the death of Edward, Camden says that an attempt was made by Dudley to induce Elizabeth to resign her title to the crown for a sum of money, and certain lands to be settled on her: her reply was, "that her elder sister, the Lady Mary, was first to be agreed withal; for as long as the said Lady Mary lived she, for her part, could challenge no right at all." Burnett says that both she and Mary, having been allured by messages from Dudley, who no doubt wished to get them into his hands, were on their way to town, when the news of Edward's approaching end induced them to turn back. When Mary came to London after being proclaimed queen, the Lady Elizabeth went to meet her with 500 horse, according to Camden, others say with 2000. Fox, the martyrologist, relates that "Queen Mary, when she was first queen, before she was crowned, would go no whither, but would have her by the hand, and send for her to dinner and supper." At Mary's coronation, in October 1553, according to Holinshed, as the queen rode through the city towards Westminster, the chariot in which she sat was followed by another "having a covering of cloth of silver, all white, and six horses trapped with the like, wherein sat the Lady Elizabeth and the Lady Anne of Cleve." Another account says that Elizabeth carried the crown on this occasion.

From this time Elizabeth, who had been brought up in their religion, became the hope of the Protestant party. Her position however was one of great difficulty. At first she refused to attend her sister to mass, endeavouring to soothe Mary by appealing to her compassion: after some time however she yielded an outward compliance. The act passed by the parliament, which, although it did not mention her by name, bastardised her by implication, by annulling her father's divorce from his first wife, could not fail to give her deep offence. Availing herself of an order of Mary, assigning her a rank below what her birth entitled her to, as an excuse for wishing to retire from court, she obtained leave to go to her house at Ashridge, in Buckinghamshire, in the beginning of December. About the same time Mary has been supposed to have been irritated against her sister by the preference shown for Elizabeth by her kinsman Edward Courtenay, whom, after releasing from the Tower, the queen had restored to his father's title of Earl of Devon, and is said to have had some thoughts of marrying. It appears to have been part of the design of the rash and unfortunate attempt of Wyatt, in the beginning of the following year, to bring about a marriage between Elizabeth and Courtenay, who was one of those engaged in the revolt. This affair involved Elizabeth in the greatest danger. On the 8th of February, the day after the suppression of the insurrection, certain members of the council were sent with a party of 250 (other accounts say 600) horse to Ashridge, with orders to bring her to London "quick or dead." They arrived during the night, and although they found her sick in bed, they immediately forced their way into her chamber, and informed her that she must "prepare against the morning, at nine of the clock, to go with them, declaring that they had brought with them the queen's litter for her." She was so ill however that it was not till the fourth night that she reached Highgate. "Here," says Fox, "she being very sick, tarried that night and the next day; during which time of her abode there came many pursuivants and messengers from the court, but for what purpose I cannot tell." When she entered London great multitudes of people came flocking about her litter, which she ordered to be opened to show herself. The city was at this time covered with gibbets; fifteen had been erected in different places, on which fifty-two persons were hanged; and it appears to have been the general belief that Elizabeth would suffer, as Lady Jane Grey had done a few days before. From the time of her arrival in town she was kept in close confinement in Whitehall. It appears that her case was twice debated in council; and although no evidence had been obtained by all the exertions of the crown lawyers which went farther than to make it probable that Wyatt and Courtenay had solicited her to give her

assent to their projects of revolt, her immediate destruction was strongly advised by some of the members. Elizabeth long afterwards used to declare that she fully expected death, and that she knew her sister thirsted for her blood. It was at last determined however that for the present she should only be committed to the Tower, although she seems herself still to have been left in doubt as to her fate. She was conveyed to her prison by water on the morning of the 11th of March, being Palm Sunday, orders being issued that, in the meantime, "every one should keep the church and carry their palms." In attempting to shoot the bridge the boat was nearly swamped. She at first refused to land at the stairs leading to the Traitor's Gate; but one of the lords with her told her she should have no choice; "and because it did then rain," continues Fox, "he offered to her his cloak, which she (putting it back with her hand with a good dash) refused. So she coming out, having one foot upon the stair, said, 'Here landeth as true a subject as ever landed at these stairs; and before thee, O God, I speak it, having none other friends but thee alone.' She remained in close custody for about a month, after which she was allowed to walk in a small garden within the walls of the fortress. On the 19th of May she was removed, in charge of Sir Henry Bedingfield, to Woodstock. Here she was guarded with great strictness and severity by her new jailor. Camden says that at this time she received private letters both from Henry II. of France, inviting her to that country, and from Christian III. of Denmark (who had lately embraced the Protestant religion), soliciting her hand for his son Frederick. When these things came to the ears of her enemies, her life was again threatened. "The Lady Elizabeth," adds the historian, "now guilting herself as a ship in blustering weather, both heard divine service after the Romish manner, and was frequently confessed; and at the pressing instances and menaces of cardinal Pole, professed herself, for fear of death, a Roman Catholic. Yet did not Queen Mary believe her." She remained at Woodstock till April 1555, when she was, on the interposition, as it was made to appear, of King Philip, allowed to take up her residence at the royal palace of Hatfield, under the superintendence of a Roman Catholic gentleman, Sir Thomas Pope, by whom she was treated with respect and kindness. Philip was anxious to have the credit of advising mild measures in regard to the princess, and perhaps he was really more disposed to treat her with indulgence than his wife. According to Camden, some of the Roman Catholic party wished to remove her to a distance from England, and to marry her to Emanuel Philibert, duke of Savoy; but Philip opposed this scheme, designing her for his eldest son Charles (the unfortunate Don Carlos). Elizabeth also was herself averse to a marriage with the Savoyard.

She continued to reside at Hatfield till the death of Mary, which took place on the 17th of November 1558. The news was communicated the same day, but not till after the lapse of some hours, to the House of Lords, which was sitting at the time. "They were seized at first," says Camden (or rather his translator), "with a mighty grief and surprise, but soon wore off those impressions, and, with an handsome mixture of joy and sorrow, upon the loss of a deceased and the prospect of a succeeding princess, they betook themselves to public business, and, with one consent, agreed that the Lady Elizabeth should be declared the true and lawful heir of the kingdom according to the act of succession made 35 Henry VIII." It is probable that Elizabeth's outward compliance in the matter of religion had considerable effect in producing this unanimity, for the majority of the lords were Catholics, and certainly both the bishops and many of the lay peers would have been strongly inclined to oppose her accession if they had expected that she would venture to disturb the established order of things. The members of the lower house were now called up, and informed of what had been done by Archbishop Heath, the chancellor. He concluded by saying that, since no doubt could or ought to be made of the Lady Elizabeth's right of succession, the House of Peers only wanted their consent to proclaim her queen. A vote to that effect immediately passed by acclamation; and, as soon as the houses rose, the proclamation took place. Elizabeth came to London on Wednesday the 23rd: she was met by all the bishops in a body at Highgate, and escorted by an immense multitude of people of all ranks to the metropolis, where she took up her lodgings at the residence of Lord North, in the Charter House. On the afternoon of Monday the 28th she made a progress through the city in a chariot to the royal palace of the Tower: here she continued till Monday the 5th of December, on the morning of which day she removed by water to Somerset House.

Elizabeth was twenty-five years of age when she came to the throne; and one of her earliest acts of royalty, by which, as Camden remarks, she gave proof of a prudence above her years, was what we should now call the appointment of her ministers. She retained of her privy council thirteen Roman Catholics, who had been of that of her sister; including Heath, archbishop of York and lord chancellor; William Paulet, marquis of Winchester, the lord high treasurer; Edward, Lord Clinton, the lord high admiral; and William, Lord Howard of Effingham, the lord chamberlain. But with these she associated seven others of her own religion, the most eminent of whom was the celebrated William Cecil, afterwards Lord Burleigh, whom she appointed to the office of secretary of state, which he had already held under Edward VI. Soon after, Nicholas Bacon (the father of the great

chancellor) was added to the number of the privy councillors, and made at first lord privy seal, and next year lord keeper of the great seal, on the resignation of Archbishop Heath. Cecil became lord high treasurer on the death of the Marquis of Winchester in 1572, and continued to be Elizabeth's principal adviser till his death in 1598, when he was succeeded by Thomas Sackville, Lord Buckhurst (afterwards made Earl of Dorset by James I.). Of the other persons who served as ministers during Elizabeth's long reign, by far the most worthy of note were Sir Francis Walsingham (who was principal secretary of state from 1573 till his death in 1590, and was all the time they were in office together the confidential friend and chief assistant of Cecil the premier, under whose patronage he had entered public life), and Burleigh's son, Robert Cecil (afterwards Earl of Salisbury), who succeeded Walsingham as secretary of state, and held that office till the end of the reign. Among the other persons of ability that were employed in the course of the reign, in different capacities, may be mentioned Sir Nicholas Throckmorton; "a man," says Camden, "of a large experience, piercing judgment, and singular prudence, who discharged several embassies with a great deal of diligence and much to his praise, yet could he not be master of much wealth, nor rise higher than to those small dignities (though glorious in title) of chief cupbearer of England and chamberlain of the Exchequer; and this because he acted in favour of Leicester against Cecil, whose greatness he envied;" Sir Thomas Smith, the learned friend of Cheke, who had been one of the secretaries of state along with him under Edward VI., and held the same office again under Elizabeth for some years before his death in 1577; and Sir Christopher Hatton, who was lord chancellor from 1587 till his death in 1591, and whom Camden, after having related his singular rise from being one of the band of gentlemen pensioners, to which he was appointed by the queen, who was taken with his handsome shape and elegant dancing at a court masque, characterises as "a great patron of learning and good sense, and one that managed that weighty part of lord chancellor with that equity and clearness of principle as to be able to satisfy his conscience and the world too."

The affair to which Elizabeth first applied her attention on coming to the throne, and that in connection with which all the transactions of her reign must be viewed, was the settlement of the national religion. The opinions of Cecil strongly concurred with her own in favour of the reformed doctrines, to which also undoubtedly the great mass of the people was attached. For a short time however she kept her intentions a secret from the majority of the council, taking her measures in concert only with Cecil and the few others who might be said to form her cabinet. She began by giving permission, by proclamation, to read part of the church-service in English, but at the same time strictly prohibited the addition of any comments, and all preaching on controversial points. This however was enough to show the Roman Catholic party what was coming: accordingly, at her coronation, on the 15th of January 1559, the bishops in general refused to assist, and it was with difficulty that one of them, Oglethorpe of Carlisle, was prevailed upon to set the crown on her head. The principal alterations were reserved to be made by the parliament, which met on the 25th of this month. Of the acts which were passed, one restored to the crown the jurisdiction established in the reign of Henry VIII. over the estate ecclesiastical and spiritual, and abolished all foreign powers repugnant to the same; and another restored the use of King Edward's book of common prayer, with certain alterations, that had been suggested by a royal commission over which Parker (afterwards archbishop of Canterbury) presided. In accordance with this last statute public worship began to be performed in English throughout the kingdom on Whit-Sunday, which fell on the 8th of May. By a third act the first fruits and tenths of benefices were restored to the crown; and by a fourth, her Majesty was authorised, upon the avoidance of any archbishopric or bishopric, to take certain of the revenues into her own hands; and conveyances of the temporalities by the holder for a longer term than twenty-one years, or three lives, were made void. The effect of these laws was generally to restore the church to the state in which it was in the reign of Edward VI., the royal supremacy sufficing for such further necessary alterations as were not expressly provided for by statute. A strong opposition was made to the bills in the House of Lords by the bishops; and fourteen of them, being the whole number, with the exception of Anthony, bishop of Llandaff, were now deprived for refusing to take the oath of supremacy. About one hundred prebendaries, deans, archdeacons, and heads of colleges, were also ejected. The number of the inferior clergy however that held out was very small, amounting to no more than eighty rectors and other parochial ministers, out of between nine and ten thousand. On this subject it is only necessary further to state that the frame of ecclesiastical polity now set up, being in all essential particulars the same that still subsists, was zealously and steadily maintained by Elizabeth and her ministers to the end of her reign. The Church of England has good reason to look upon her and Cecil as the true planters and rearsers of its authority. They had soon to defend it against the Puritans on the one hand as well as against the Roman Catholics on the other, and they yielded to the former as little as to the latter. The Puritans had been growing in the country ever since the dawn of the Reformation, but they first made their appearance in any considerable force in the parliament

which met in 1570. At first their attempts were met on the part of the crown by evasive measures and slight checks; but in 1587, on four members of the House of Commons presenting to the house a bill for establishing a new Directory of Public Worship, Elizabeth at once gave orders that they should be seized and sent to the Tower, where they were kept some time. The High Commission Court also, which was established by a clause in one of the acts for the settlement of religion passed in the first year of her reign, was, occasionally at least, prompted or permitted to exercise its authority in the punishment of what was called heresy, and in enforcing uniformity of worship with great strictness. The determination upon which the queen acted in these matters, as she expressed it in a letter to the Archbishop of Canterbury, was, "that no man should be suffered to decline either to the left or to the right hand, from the drawn line limited by authority, and by her laws and injunctions." Besides the deprivation of their livings, which many of the clergy underwent for their refusal to comply with certain particulars of the established ritual, many other persons suffered imprisonment for violations of the Statute of Uniformity. It was against the Roman Catholics however that the most severe measures were taken. By an act passed in 1585 (the 27th Eliz., c. 2), every Jesuit or other popish priest was commanded to depart from the realm within forty days, on pain of death as a traitor, and every person receiving or relieving any such priest was declared guilty of felony. Many priests were afterwards executed under this act.

It was the struggle with popery that moved and directed nearly the whole policy of the reign, foreign as well as domestic. When Elizabeth came to the throne she found the country at peace with Spain, the head of which kingdom had been her predecessor's husband, but at war with France, the great continental opponent of Spain and the Empire. Philip, with the view of preserving his English alliance, almost immediately after her accession offered himself to Elizabeth in marriage; but, after deliberating on the proposal, she determined upon declining it, awayed by various considerations, and especially, as it would appear, by the feeling that, by consenting to marry her sister's husband on a dispensation from the pope, she would in a manner be affirming the lawfulness of her father's marriage with Catharine of Aragon, the widow of his brother Arthur, and condemning his subsequent marriage with her own mother, the sole validity of which rested on the alleged illegality of that previous connection. A general peace however, comprehending all the three powers and also Scotland, was established in April 1559, by the treaty of Cateau Cambresis. By this treaty it was agreed that Calais, which had been taken by France in the time of Queen Mary, and formed the only difficult subject of negotiation, should be restored to England in eight years, if no hostile act should be committed by Elizabeth within that period. Scarcely however had this compact been signed when the war was suddenly rekindled, in consequence of the assumption by the new French king, Francis II., of the arms and royal titles of England, in right, as was pretended, of his wife, the young Mary, queen of Scots. Elizabeth instantly resented this act of hostility by sending a body of 5000 troops to Scotland, to act there with the Duke of Chatelherault and the Lords of the Congregation, as the leaders of the Protestant party called themselves, against the government of the queen and her mother, the regent, Mary of Guise. The town of Leith soon yielded to this force; and the French king was speedily compelled both to renounce his wife's pretensions to the English throne and to withdraw his own troops from Scotland, by the treaty of Edinburgh, executed 7th of July 1560. The treaty however never was ratified either by Francis or his queen, and in consequence the relations between the three countries continued in an unsatisfactory state. Charles IX. succeeded his brother on the throne of France before the end of this year, and in a few months afterwards Mary of Scotland returned to her own country.

Meanwhile, although the two countries continued at peace, Elizabeth's proceedings in regard to the church had wholly alienated Philip of Spain. The whole course of events, and the position which she occupied, had already in fact caused the English queen to be looked upon as the head of the Protestant interest throughout Europe as much as she was at home. When the dispute therefore between the Roman Catholics and the Huguenots, or reformed party, in France came to a contest of arms in 1562, the latter immediately applied for assistance to Elizabeth, who concluded a treaty with them, and sent them succour both in men and money. The war that followed produced no events of importance in so far as England was concerned, and was terminated by a treaty signed at Troyes, 11th of April 1564. A long period followed, during which England preserved in appearance the ordinary relations of peace both with France and Spain, though interferences repeatedly took place on each side that all but amounted to actual hostilities. The Protestants alike in Scotland, in France, and in the Netherlands (then subject to the dominion of Philip), regarded Elizabeth as firmly bound to their cause by her own interests; and she on her part kept a watchful eye on the religious and political contentions of all these countries, with a view to the maintenance and support of the Protestant party, by every species of countenance and aid short of actually making war in their behalf. With the Protestant government in Scotland, which had deposed and imprisoned the queen, she was in open and intimate alliance; in favour of the French Huguenots she at one time negotiated or threatened, at another even

went the length, scarcely with any concealment, of affording them pecuniary assistance; and when the people of the Netherlands at length rose in revolt against the oppressive government of Philip, although she refused the sovereignty of their country, which they offered to her, she lent them money, and in various other ways openly expressed her sympathy and goodwill. On the other hand, Philip, although he refrained from any declaration of war, and the usual intercourse both commercial and political long went on between the two countries without interruption, was incessant in his endeavours to undermine the throne of the English queen, and the order of things at the head of which she stood, by instigating plots and commotions against her authority within her own dominions. He attempted to turn to account in this way the Roman Catholic interest, which was still so powerful both in England and in Ireland—the intrigues of the Scottish queen and her partisans materially contributing to the same end.

The history of Mary Stewart and of the affairs of Scotland during her reign and that of her son must be reserved for a separate article. But it is necessary to observe here, that Mary was not merely the head of the Roman Catholic party in Scotland, but as the descendant of the eldest daughter of Henry VII., had pretensions to the English crown which were of a very formidable kind. Although she was kept in confinement by the English government after her flight from the hands of her own subjects in 1568, the imprisonment of her person did not extinguish the hopes or put an end to the efforts of her adherents. Repeated rebellions in Ireland, in some instances openly aided by supplies from Spain—the attempt made by the Duke of Alva in 1569, through the agency of Vitelli, to concert with the Roman Catholic party the scheme of an invasion of England—the rising of the Roman Catholics of the northern counties under the earls of Northumberland and Westmoreland the same year—the plot of the Duke of Norfolk with Ridolfi in 1571, for which that unfortunate nobleman lost his head—the plots of Throgmorton and Creighton in 1584, and of Babington in 1586—to omit several minor attempts of the same kind—all testified the restless zeal with which the various enemies of the established order of things pursued their common end. Meanwhile however events were tending to a crisis which was to put an end to the outward show of friendship that had been so long kept up between parties that were not only fiercely hostile in their hearts, but had even been constantly working for each other's overthrow behind the thin screen of their professions and courtesies. The Queen of Scots was put to death in 1587, by an act of which it is easier to defend the state policy than either the justice or the legality. By this time also, although no actual declaration of war had yet proceeded either from England or Spain, the cause of the people of the Netherlands had been openly espoused by Elizabeth, whose general, the Earl of Leicester, was now at the head of the troops of the United Provinces, as the revolted states called themselves. An English fleet at the same time attacked and ravaged the Spanish settlements in the West Indies. At last, in the summer of 1588, the great Spanish fleet, arrogantly styled the Invincible Armada, sailed for the invasion of England, and, as is noticed below [see the end of this article], was in the greater part dashed to pieces on the coasts which it came to assail. From this time hostilities proceeded with more or less activity between the two countries during the remainder of the reign of Elizabeth. Meanwhile Henri III., and after his assassination in 1589 the young King of Navarre, assuming the title of Henri IV., at the head of the Huguenots, had been maintaining a desperate contest in France with the Duke of Guise and the League. For some years Elizabeth and Philip remained only spectators of the struggle; but at length they were both drawn to take a principal part in it. The French war however, in so far as Elizabeth was concerned, must be considered as only another appendage to the war with Spain; it was Philip chiefly, and not the League, that she opposed in France—just as in the Netherlands, and formerly in Scotland, it was not the cause of liberty against despotism, or of revolted subjects against their legitimate sovereign, that she supported, or even the cause of Protestantism against Roman Catholicism, but her own cause against Philip, her own right to the English throne against his, or that of the competitor with whom he took part. Since the death of Mary of Scotland, Philip professed to consider himself as the rightful king of England, partly on the ground of his descent from John of Gaunt, and partly in consequence of Mary having by her will bequeathed her pretensions to him should her son persist in retaining a heretic. Henri IV., having previously embraced Catholicism, made peace with Philip by the treaty of Vervins, concluded in May 1598; and the death of Philip followed in September of the same year. But the war between England and Spain was nevertheless still kept up. In 1601 Philip III. sent a force to Ireland, which landed in that country and took the town of Kinsale; and the following year Elizabeth retaliated by fitting out a naval expedition against her adversary, which captured some rich prizes, and otherwise annoyed the Spaniard. Her forces continued to act in conjunction with those of the Seven United Provinces both by sea and land.

Elizabeth died on the 24th of March 1603, in the seventieth year of her age and the forty-fifth of her reign. In the very general account to which we have necessarily confined ourselves of the course of public transactions during the long period of the English annals with

which her name is associated, we have omitted all reference to many subordinate particulars, which yet strongly illustrate both her personal conduct and character and the history of her government. One of the first requests addressed to her by the parliament after she came to the throne was that she would marry; but for reasons which were probably various, though with regard to their precise nature we are rather left to speculation and conjecture than possessed of any satisfactory information, she persisted in remaining single to the end of her days. Yet she coquetted with many suitors almost to the last. In the beginning of her reign, among those who aspired to her hand, after she had rejected the offer of Philip of Spain, were Charles, archduke of Austria (a younger son of the Emperor Ferdinand I.); James Hamilton, earl of Arran, the head of the Protestant party in Scotland; Erick XIV., king of Sweden (whom she had refused in the reign of her sister Mary); and Adolphus, duke of Holstein (uncle to Ferdinand II. of Denmark). "Nor were there wanting at home," adds Camden, "some persons who fed themselves (as lovers use to do) with golden dreams of marrying their sovereign;" and he mentions particularly Sir William Pickering, "a gentleman well born, of a narrow estate, but much esteemed for his learning, his handsome way of living, and the management of some embassies into France and Germany;" Henry, earl of Arundel; and Robert Dudley (afterwards the notorious earl of Leicester), a younger son of the Duke of Northumberland, "restored by Queen Mary to his honour and estate; a person of youth and vigour, and of a fine shape and proportion, whose father and grandfather were not so much hated by the people, but he was as high in the favour of Queen Elizabeth, who out of her royal and princely clemency heaped honours upon him, and saved his life whose father would have destroyed her's."

Leicester continued the royal favourite till his death in 1588, disgracing by his profligacy the honours and grants that were lavished upon him by Elizabeth, who, having appointed him commander-in-chief of the forces which she sent to the assistance of the Dutch, insisted upon maintaining him in that situation, notwithstanding the mischiefs produced by his incapacity and misconduct, and, at the perilous crisis of the Spanish invasion, was on the point of constituting him lieutenant-governor of England and Ireland. Camden says that the left-repatent were already drawn, when Burghley and Hatton interfered, and put a stop to the matter. Of the foreign princes that have been mentioned, the archduke Charles persisted longest in his suit: a serious negotiation took place on the subject of the match in 1567, but it came to nothing. In 1571 proposals were made by Catherine de' Medici for a marriage between Elizabeth and her son Charles IX., and afterwards in succession with her two younger sons, Henry, duke of Anjou (afterwards Henri III.), and Francis, duke of Alençon (afterwards Duke of Anjou). The last match was again strongly pressed some years after; and in 1581 the arrangement for it had been all but brought to a conclusion when, at the last moment, Elizabeth drew back, declining to sign the marriage articles, after she had taken up the pen for the purpose. Very soon after the death of Leicester, the young Robert Devereux, earl of Essex, whose mother Leicester had married, was taken into the same favour that had been so long enjoyed by the deceased nobleman; and his tenure of the royal partiality lasted, with some intermissions, till he destroyed himself by his own hot-headedness and violence. He was executed for a frantic attempt to excite an insurrection against the government in 1601. Elizabeth however never recovered from this shock; and she may be said to have sealed her own sentence of death in signing the death-warrant of Essex.

Both the personal character of Elizabeth and the character of her government have been estimated very differently by writers of opposite parties. That she had great qualities will hardly be disputed by any one who duly reflects on the difficulties of the position she occupied, the consummate policy and success with which she directed her course through the dangers that beset her on all sides, the courage and strength of heart that never failed her, the imposing attitude she maintained in the eyes of foreign nations, and the admiration and pride of which she was the object at home. She was undeniably endowed with great good sense, and with a true feeling of what became her place. The weaknesses, and also the more forbidding features of her character, on the other hand, are so obvious as scarcely to require to be specified. Many of the least respectable mental peculiarities of her own sex were mixed in her with some of the least attractive among those of the other. Her selfishness and her vanity were both intense; and of the sympathetic affections and finer sensibilities of every kind she was nearly destitute.

Her literary knowledge was certainly very considerable; but of her compositions (a few of which are in verse) none are of much value, nor evidence any very superior ability, with the exception perhaps of some of her speeches to the parliament. A list of the pieces attributed to her may be found in Walpole's 'Royal and Noble Authors.'

There has been a good deal of controversy as to the proportion in which the elements of liberty and despotism were combined in the English constitution, or in the practice of the government, in the reign of Elizabeth; the object of one party being to convict the Stuarts of deviating into a new course in those exertions of the prerogative and that resistance to the popular demands which led to the civil wars of the 17th century,—of the other, to vindicate them from that charge,

by showing that the previous government of Elizabeth had been as arbitrary as theirs. There can be no doubt that the first James and the first Charles pursued their object with much less art, and much less knowledge and skill in managing the national character, as well as in less advantageous circumstances, than Elizabeth and her ministers; they did not know nearly so well when to resist and when to yield as she did; but it may notwithstanding be reasonably questioned if her notion of the rightful supremacy of the crown was very different from theirs. However constitutional also (in the modern sense of the term) may have been the general course of her government, her occasional practice was certainly despotic enough. She never threw aside the sword of the prerogative, although she may have usually kept it in its scabbard.

Her reign however, take it all in all, was a happy as well as a glorious one for England. The kingdom under her government acquired and maintained a higher and more influential place among the states of Europe, principally by policy, than it had ever been raised to by the most successful military exertions of former ages. Commerce flourished and made great advances, and wealth was much more extensively and rapidly diffused among the body of the people than at any former period. It is the feeling of progress, rather than any degree of actual attainment, that keeps a nation in spirits; and this feeling everything conspired to keep alive in the hearts of the English in the age of Elizabeth; even the remembrance of the stormy times of their fathers, from which they had escaped, lending its aid to heighten the charm of the present calm. To these happy circumstances of the national condition was owing, above all, and destined to survive all their other products, the rich native literature, more especially in poetry and the drama, which now rushed up, as if from the tillage of a virgin soil, covering the land with its perennial fruit and flowers. Spenser and Shakspeare, Beaumont and Fletcher, Raleigh and Bacon, and many other eminently distinguished names, gained their earliest celebrity in the Elizabethan age.

The invasion of England by the SPANISH ARMADA is so important an occurrence in English history that we deem it advisable to relate here, as fully as our limits permit, the story of the descent and destruction of that famous fleet, rather than merely to introduce it as an episode in the life of Elizabeth. In the beginning of May 1588, the preparations of Philip II. for the invasion of England, which had so long kept Europe in amazement and suspense, were brought to a conclusion; and the Spaniards, in the confidence of success, previous to its sailing, gave their fleet the name of the Invincible Armada. It consisted at this time of 130 vessels: 65 of these were galleons and larger ships; 25 were pink-built ships; 19 tenders; 13 small frigates; 4 were galleasses; and 4 galleys. The soldiers on board amounted to 19,295, the mariners to 8050; of these, 3330 soldiers and 1293 mariners had been supplied by Portugal: besides which, the rowers in the galleasses amounted to 1200, and in the galleys to 888. There were also on board 2431 pieces of artillery, and 4575 quintals of powder: 347 of the pieces of artillery had likewise been supplied by Portugal. Two thousand volunteers of the most distinguished families in Spain, exclusive of the sailors and soldiers already mentioned, are stated to have accompanied the expedition.

Philip's preparations in the Netherlands, of a further force, were not less advanced than those of Spain. Besides a well-appointed army of 30,000 foot and 4000 horse, which the Duke of Parma had assembled in the neighbourhood of Nieuport and Dunkirk, that active general had provided a number of flat-bottomed vessels, fit for transporting both horse and foot, and had brought sailors to navigate them from the towns in the Baltic. Most of these vessels had been built at Antwerp; and to prevent the Dutch from intercepting them should they pass by sea, they were sent along the Schelde to Ghent, thence by the canal to Bruges, and so to Nieuport by a new canal dug for the particular occasion. This laborious undertaking, in which several thousand workmen had been employed, was already finished, and the duke now only waited for the arrival of the Spanish fleet; hoping that, as soon as it should approach, the Dutch and English ships, which cruised upon the coast, would retire into their harbours.

The details of the regular force which the English assembled to oppose the Armada, both by sea and land, are minutely given in a manuscript now in the British Museum ('MS. Reg.' 18 C. xxi.), formerly belonging to the Royal Library. At the time when Queen Elizabeth began her preparations, her fleet did not amount to more than thirty ships, none of them near equal in size to those of the enemy. Ultimately however the different descriptions of vessels, large and small, which formed her navy, amounted to 181 ships, manned by 17,472 sailors. The military force consisted of two armies, one for immediately opposing the enemy, under the Earl of Leicester; the other for the defence of the queen's person, commanded by Lord Hunadon. The army appointed for the defence of the queen's person amounted to 45,362, besides the band of pensioners, with 36 pieces of ordnance. Lord Leicester's army amounted to 18,449; the total of both armies to 63,811, besides 2000 foot who were expected from the Low Countries. The forces of the Presidentship of the North remained stationary, in case anything should be attempted on the side of Scotland; as were also the forces of the Presidentship of Wales.

The Armada was to have left Lisbon in the beginning of May, but

the Marquess de Santa Cruz, who had been appointed admiral, at the moment fixed for the departure was seized with a fever, of which he died in a few days; and by a singular fatality, the Duke de Paliano, the vice-admiral, died likewise at the same time. Santa Cruz was reckoned the first naval officer in Spain; and Philip found it extremely difficult to supply his place: he at last filled it with the Duke de Medina Sidonia, a nobleman of high reputation, but entirely unacquainted with maritime affairs. Martinez de Recaldo however, a seaman of great experience, was made vice-admiral.

In these arrangements so much time was lost, that the fleet could not leave Lisbon till the 29th of May. It had not advanced far in its voyage to Corunna, at which place it was to receive some troops and stores, when it was overtaken by a violent storm and dispersed. All the ships however reached Corunna, La Coruña (the Groyne, as it is called by our historians and sailors), though considerably damaged, except four. They were repaired with the utmost diligence, the king sending messengers every day to hasten their departure; yet several weeks passed before they were in a condition to resume the voyage.

In the meantime a report was brought to England that the Armada had suffered so much by the storm as to be unfit for proceeding in the intended enterprise; and so well attested did the intelligence appear, that, at the queen's desire, Secretary Walsingham wrote to the English admiral, requiring him to lay up four of his largest ships and to discharge the seamen. Lord Howard was happily less credulous on this occasion than either Elizabeth or Walsingham, and desired that he might be allowed to retain these ships in the service, even though it should be at his own expense, till more certain information were received. In order to procure it, he set sail with a brisk north wind for Corunna, intending, in case he should find the Armada so much disabled as had been reported, to complete its destruction. On the coast of Spain he received intelligence of the truth: at the same time, the wind having changed from north to south, he began to dread that the Spaniards might have sailed for England, and therefore returned without delay to his former station at Plymouth.

Soon after his arrival Lord Howard was informed that the Armada was in sight. He immediately weighed anchor, and sailed out of the harbour, still uncertain of the course which the enemy intended to pursue. On the next day he perceived them steering directly towards him, drawn up in the form of a crescent, which extended seven miles from one extremity to the other. Plymouth was at first supposed to be the place of destination; but it was soon apparent that the Duke de Medina adhered to the execution of the plan which had been laid down for him by the court of Madrid. This was, to steer quite through the Channel till he should reach the coast of Flanders, and, after raising the blockade of the harbours of Nieuport and Dunkirk by the English and Dutch ships, to escort the Duke of Parma's army to England, as well as land the forces which were on board his own fleet. Lord Howard, instead of coming to close and unequal fight, contented himself with harassing the Spaniards on their voyage, and with watching attentively all the advantages which might be derived from storms, cross-winds, and other accidents. It was not long before he discerned a favourable opportunity of attacking the vice-admiral Recaldo. This he did in person; and on that occasion displayed so much dexterity in working his ship, and in loading and firing his guns, as greatly alarmed the Spaniards for the fate of their vice-admiral. From that time they kept closer to each other; notwithstanding which, the English on the same day attacked one of the largest galleasses. Other Spanish ships came up in time to her relief, but in their hurry, one of the principal galleons, which had a great part of the treasure on board, ran foul of another ship, and lost one of her masts. In consequence of this misfortune she fell behind, and was taken by Sir Francis Drake; who, on the same day, took another capital ship, which had been accidentally set on fire. Several other rencontres happened, and in all of them the English proved victorious. Their ships were lighter, and their sailors more dexterous than those of the Spaniards. The Spanish guns were planted too high, while every shot from the English proved effectual. The Spaniards however still continued to advance till they came opposite to Calais, where the Duke de Medina, having ordered them to cast anchor, sent information to the Duke of Parma of his arrival, and entreated him to hasten the embarkation of his forces. But the duke, though he embarked a few of his troops, informed Medina that the vessels which he had prepared were proper only for transporting the troops, but were utterly unfit for fighting; and for this reason, till the Armada was brought nearer, and the coast cleared of the Dutch ships which had blocked up the harbours of Nieuport and Dunkirk, he could not stir from his then station (at Bruges) without exposing his army to certain ruin. In compliance with this request, the Armada was ordered to advance; and it had arrived within sight of Dunkirk, between the English fleet on one hand and the Dutch on the other, when a sudden calm put a stop to its motions. In this situation the fleets remained for a whole day. About the middle of the night of August the 7th a breeze sprung up, and Lord Howard had recourse to an expedient which had been planned the day before. Having filled eight ships with pitch, sulphur, and other combustible materials, he set fire to them, and sent them before the wind against the different divisions of the Spanish fleet. The Spaniards beheld these ships in flames approaching them with great dismay: the darkness of the night

increased their terror, and the panic flew entirely through the fleet. The crews of the different vessels, anxious only for their own preservation, thought of nothing but how to escape from immediate danger. Some weighed their anchors, whilst others cut their cables, and suffered their ships to drive before the wind. In this confusion many of the ships ran foul of one another, and several of them received such damage as to be rendered unfit for future use.

When daylight returned, Lord Howard had the satisfaction to perceive that his stratagem had produced the desired effect. The enemy was still in extreme disorder, and their ships widely separated and dispersed. His fleet having received a great augmentation by the ships fitted out by the nobility and gentry, as well as by those of Lord Seymour, who had left Justin de Nassau as alone sufficient to guard the coast of Flanders, and being bravely seconded by Sir Francis Drake and all the other officers, he hastened to improve the advantage which was now presented to him, and attacked the enemy in different quarters at the same time with the utmost impetuosity and ardour. The engagement began at four in the morning of August the 8th, and lasted till six at night. The Spaniards in every rencontre displayed the most intrepid bravery; but, from the causes already mentioned, did little execution against the English, while many of their own ships were greatly damaged, and ten of the largest were either run aground, sunk, or compelled to surrender.

The principal galleon, commanded by Moncada, having Manriques, the inspector-general, on board, with 800 galley-slaves and 400 soldiers, was driven ashore near Calais. Fifty thousand ducats were found on board of her. One of the capital ships, having been long battered by an English captain of the name of Cross, was sunk during the engagement. A few only of the crew were saved, who related that one of the officers on board having proposed to surrender, he was killed by another who was enraged at his proposal; that this other was killed by the brother of the first; and that it was in the midst of this bloody scene that the ship went to the bottom. The fate of two other of the Spanish galleons is particularly mentioned by contemporary historians, the *St. Philip* and the *St. Matthew*: after an obstinate engagement with the English admiral's ship they were obliged to run ashore on the coast of Flanders, where they were taken by the Dutch.

The Duke de Medina now not only despaired of success, but saw clearly that by a continuance of the combat he should risk the entire destruction of his fleet. The bulk of his vessels rendered them unfit not only for fighting, but for navigation in the narrow seas. He therefore determined to abandon the further prosecution of his enterprise; yet even to get back to Spain was difficult: he resolved therefore to sail northward, and return by making the circuit of the British Isles. Lord Seymour was detached to follow in his rear, but from the bad supply of ammunition which he had received from the public offices, was deterred from renewing an attack which in all probability would have led to the Duke de Medina's surrender.

A dreadful storm arose after the Spaniards had rounded the Orkneys, and the whole fleet was dispersed. Horses, mules, and baggage were thrown overboard to lighten a few of the vessels. Some of the ships were dashed to pieces on the rocks of Norway; some sunk in the middle of the North Sea; others were thrown upon the coasts of Scotland and the Western Isles—the wreck of one being still visible, it is said, at Tobermory, in the Isle of Mull; and more than thirty were driven by another storm, which overtook them from the west, on different parts of the coast of Ireland. Port na Spagna, on the coast of Antrim, near the Giants' Causeway, obtained its name from this circumstance. (See '*Trans. of Geol. Soc.*' vol. iii., plate 10.) Of these, some afterwards reached home in the most shattered condition, under the Vice-Admiral Recalde; others were shipwrecked among the rocks and shallows; and of those which reached the shore many of the crews were barbarously murdered, from an apprehension, it was pretended, that in a country where there were so many disaffected Catholics it would have been dangerous to show mercy to so great a number of the enemy. Camden says, "They were slain, some of them by the wild Irish, and others put to the sword by command of the lord-deputy; for he, fearing lest they would join with the Irish rebels, and seeing that Bingham, governor of Connaught, whom he had once or twice commanded to show rigour towards them as they yielded themselves, had refused to do it, sent Fowl, deputy-marshal, who drew them out of their lurking-places and hiding-places, and beheaded about two hundred of them."

The Duke de Medina, having kept out in the open seas, escaped shipwreck; and, according to the official accounts, arrived at Santander in the Bay of Biscay about the end of September, "with not more than sixty sail out of his whole fleet, and those very much shattered."

Strype, in his '*Annals*,' reckons the Spanish loss upon the coast of England to have amounted to 15 ships and above 10,000 men, besides 17 ships and 5394 men sunk, drowned, and taken upon the coast of Ireland.

The statements however published at the time, apparently upon authority, say—"In July and August, ships 15, men 4791; sunk, &c., upon the coast of Ireland, 17 ships, 5394 men;" making a total of 32 ships and 10,185 men.

There is a very curious work relating to the Spanish Armada preserved in the King's Library at the British Museum—a volume of extreme rarity, which was finished at Lisbon, May 9, 1588, while the

fleet was in the port of that place prepared for the expedition, entitled, '*La Felicissima Armada, que el Rey Don Felipe nuestro Señor mandó juntar en el puerto de la Ciudad de Lisboa, en el Reyno de Portugal, el Año de mil y quinientos y ochenta y ocho; hecha por Pedro de Paz Salas*,' fol. Lisb. 1588; por Antonio Alvarez, Impressor. This copy in the King's Library was the identical one which was procured at the time of its publication for Lord Burghley, to acquaint him with the true detail of all the preparations; and he has noted in his own hand, in the margins of different pages, a variety of particulars relating to the defeat. In one instance he has noted the change of a commander from one Spanish vessel to another different vessel. The following are a few of Lord Burghley's notes:—

"Galeon S. Philippe: 'taken at Flushing, 31 July.' D. Francesco de Toledo: 'this man escaped into Nuport.' La Nao Capitana: 'this ship was taken by Sir Francis Drake.' El Gran Grifon Capitana: 'this man's ship was drowned, 17 September, in the Ile of Furmare, Scotland.' Barca de Amburg: 'she was drowned over against Ireland.' San Pedro Mayor: 'wrecked in October, in Devonshire, near Plim-mouth.' La Galeaça Capitana nombrada S. Lorenzo: 'this was drowned at Callya.'"

The following entries perhaps afford an explanation of the lord-deputy's barbarous conduct in Ireland. Members of some Irish families were on board the Spanish fleet:—

"Admundio Estacio: 'brother to James Eustace, Viscount Baltyglass.' Don Carlos Oconore: 'of Offolly, sonn to old Oconore.' Tristan Vinglade: 'Wynland.' Ricardo Berecy, Roberto Laseo, Christoval Lombardo: 'of Mounster.'"

The copy of this work in the Royal Library, from which a few particulars in the earlier part of the preceding account have been taken, is accompanied by twelve charts of the coast of England, showing the different situations of the Spanish Armada and the English fleet through the whole of the contest. This also, which is a separate work, is of very rare occurrence, entitled '*Expositionis Hispanorum in Angliam Vera Descriptio, Anno Do. MDLXXXVIII.*' published by Robert Adam, and engraved by Augustin Ryther. The different actions and positions represented in these charts are minutely explained in a quarto tract, printed by A. Hatfield in 1590, and sold at Augustin Ryther's shop, entitled '*A Discourse concerning the Spanish Fleet invading England in the yeere 1588*'—a copy of which is also preserved in the library of the British Museum.

Camden, speaking of this great victory, says:—"Whereupon several monies were coined, some in memory of the victory, with a fleet flying with full sails, and this inscription, '*Venit, vidit, fugit*.' It came, it saw, it fled; others in honour of the queen, with fire-ships and a fleet all in confusion, inscribed, '*Dux fœmina facti*,' that is, 'A woman was conductor of the exploit.' The medals and jettons however, which were struck on this occasion, were entirely Dutch: none were struck in England. The most remarkable, of considerable size, is that which represents the Spanish fleet upon the obverse, with the words '*Flavit Jehovah et dissipati sunt*, 1588,' 'Jehovah blew, and they were scattered.' Reverse, a church on a rock, beaten by the waves, '*Allidor non Isidor*.' These, and one or two more, will be found in the '*Histoire Médallique des Pays-Bas*, tome i., pp. 388-386; and in Pinkerton's '*Medallic History of England*,' pl. viii., fno. 7, 8; pl. ix., no. 1, 6.

Philip II. published two jettons, with the inscription, '*Immensi Tremor Oceani*,' 1587 and 1588.

ELIZABETH PETROWNA, daughter of Peter the Great and of Catharine I., was born in 1709. After the death of her nephew, Peter II., in 1730, she was urged to assert her claims to the crown, but she declined to do so through indolence or timidity, and her cousin Anna, duchess of Courland, was raised to the throne. After the death of Anna in 1740, Iwan, the infant son of the Duke of Brunswick and of Ann, niece to the late empress, was proclaimed emperor under the tutelage of his mother, in conformity to the will of the defunct sovereign. A conspiracy however was soon after hatched by some of Elizabeth's attendants, especially a surgeon of the name of Lestok, who found great difficulty in conquering her irresolution: the officers of the guards were drawn into the plot, and a military insurrection followed in 1741, when Elizabeth was proclaimed empress, and Ann and her husband, the Duke of Brunswick, and the child Iwan, were put into confinement. Several noblemen were sent into Siberia. Bestucheff, who had been minister under the Empress Anna, was retained in office and appointed chancellor. Elizabeth took an active part in the war of the Austrian succession, and sent troops to the assistance of Maria Theresa, and she afterwards concurred in the peace of Aix-la-Chapelle in 1748. During the Seven Years' War, Elizabeth took part against Frederick of Prussia, it was said, from personal pique at some sarcastic reflections of the Prussian king. The Russian army invaded Prussia, won the hard-fought battle of Kunnersdorf, crossed the Oder, entered Berlin, and reduced Frederick to the verge of ruin and despair. But the illness and death of Elizabeth soon retrieved his fortunes. She died in December 1761, after a reign of twenty years, and was succeeded by the Duke of Holstein Gottorp, son of her sister Anna Petrowna, duchess of Holstein, who assumed the title of Peter III.

The government of Elizabeth was directed in great measure by favourites, who succeeded one another. The empress herself was good-natured and even amiable to those who pleased her, but indolent

and very sensual, and many acts of oppression and cruelty were perpetrated under her reign. She was averse to the punishment of death, but numerous persons were sentenced to the knout and to exile in Siberia. Several ladies, among others Madame Lapoukin, a handsome and clever woman, who had given offence to Elizabeth, experienced the same fate. Elizabeth exerted herself to forward the compilation of a code of laws for the Russian empire, a task begun under Peter the Great, but which was not completed till the reign of Catharine II. She was never married, but left several natural children.

* **ELLENBOROUGH, EDWARD LAW, First Earl of**, eldest son of the first Lord Ellenborough, was born in 1790, and succeeded to the peerage as second baron in 1818; for a few years previous to which time he had sat in the House of Commons as member for the now disfranchised borough of St. Michael's. His first political employment was bestowed upon him in 1828, when he became president of the Board of Control under the Duke of Wellington's administration. Under the short-lived ministry of Sir Robert Peel in 1834-35, he again filled the same office. In 1842 he was sent out to India to supersede the late Earl of Auckland as governor-general. On reaching India he professed pacific intentions, but soon found himself compelled to draw the sword. Affairs in Afghanistan having been brought to a successful issue, and General Sir G. Pollock and his comrades having recovered the persons of Lady Sale and the other captives from the hands of the Afghans, the British forces evacuated the country of Afghanistan. Upon this the Amers of Sindh took up arms; but the late General Sir C. Napier was despatched against them, and after one or two decisive victories had been gained, Sindh was annexed to the British dominion. In 1843 he invaded the independent Mahratta state of Gwalior, in conjunction with General Sir Hugh (now Lord) Gough, for the purpose of putting an end to the civil strife which was raging there during the regency of the youthful rajah. Scarcely had the war been brought to a close by the defeat of the Mahratta force by the troops under Gough and Littler, when Lord Ellenborough was recalled by the Board of East India Directors, contrary to the wishes of the government of Sir Robert Peel, who in the following year (1845) appointed him first lord of the admiralty. This post he only held until 1846, when he resigned on the change of administration. Since that time Lord Ellenborough has kept his attention steadily fixed on Indian affairs, which he criticises from time to time with considerable ability in his place as a member of the House of Peers.

* **ELLESMEKE, EARL OF. LORD FRANCIS LEVESON GOWER** was born in London, January 1, 1800. He is the second son of the first Duke of Sutherland, and brother of the present duke. He was educated at Eton College, and afterwards at Christchurch, Oxford. He left the university in 1820, in which year he was returned as M.P. for Bletchingly in Surrey, since disfranchised by the Reform Act. At a time when the German language was little studied in England, he distinguished himself by a translation of the 'Faust' of Göthe, in two volumes, which was more than once reprinted before the author resolved to withdraw it from circulation; it has now been several years out of print. The 'Faust' was followed by 'Translations from the German, and Original Poems, by Lord Francis Leveson Gower,' 8vo, London, 1824. This small volume consists of translations of seven lyrical poems by Schiller, one by Göthe, one by Salis, and three by Körner, and of thirteen original poems. He was M.P. for Sutherlandshire from 1826 to 1830. In 1827 he was made a lord of the treasury. From January 1828 to July 1830 he was chief secretary for Ireland, and from July to November 1830 he was secretary at war. After the death of his father in 1833, having received as his inheritance the Bridgewater estates, which his father had inherited from the last Duke of Bridgewater, he assumed the name of EGERTON. From 1835 to 1846 Lord Francis Egerton was M.P. for South Lancashire. In the autumn of 1839 he commenced a voyage in his own yacht up the Mediterranean Sea. He wintered at Rome, whence he sailed for Malta in April 1840, and having landed on the coast of Syria, made a tour in Palestine. In 1841 he was elected rector of the university of Aberdeen. In 1843 he published 'Mediterranean Sketches, by Lord Francis Egerton,' 12mo. In this volume the poem called 'The Pilgrimage' records some of the most interesting impressions of his tour in Palestine. It is followed by extracts from his journal and by a few poems. A new edition of these poems, with several additions, has been published this year (1856), 'The Pilgrimage, and other Poems,' 4to. In 1846 he was created Earl of Ellesmere and Viscount Brackley, titles nearly corresponding to those held by Lord Chancellor Egerton, who, at the time of his death, held the title of Viscount Brackley, and had previously held that of Baron Ellesmere. [EGERTON, THOMAS.] The Earl of Ellesmere was elected President of the Asiatic Society in 1849. In 1855 he was created a knight of the Garter, and in the same year became colonel-commandant of the Lancashire yeomanry cavalry; he is also deputy lieutenant of Sutherlandshire.

Besides the works before mentioned, the Earl of Ellesmere has published the 'Camp of Wallenstein, and other Poems;' the tragedies of 'Catherine of Cleves and Hernani;' 'The Sieges of Vienna by the Turks, from the German of K. A. Schimmer, and other sources,' 16mo, 1847; 'Military Events in Italy, transcribed from the German,' 12mo, 1851; 'Life and Character of the Duke of Wellington,' 12mo, 1852; 'History of the Two Tartar Conquerors of China, from the French of J. P. D'Orleans,' 8vo, 1854.

The Earl of Ellesmere, at his residence, Bridgewater House, Cleveland Square, London, has one of the very finest galleries of paintings possessed by any individual in the kingdom. He inherited the chief portion of it as a part of the property of the Duke of Bridgewater, but he has made some additions to it himself, and he has in a very handsome manner made it accessible to the public. We ought to mention that his lordship has recently presented to the nation his celebrated portrait of Shakspeare, known as the Chandos Shakspeare, with a view to its forming a portion of the projected National Gallery of Portraits.

* **ELLIOTSON, DR. JOHN**, was born in London towards the close of the 18th century, and entered first at the university of Edinburgh, and subsequently at that of Cambridge. His early medical education was pursued in St. Thomas's and Guy's hospitals. In 1817 he was appointed assistant physician of the latter, and in 1822 he became physician, after some controversy with the governors, of St. Thomas's. Here he introduced the practice of giving clinical lectures, a practice at first opposed by the governors, but now become general. He also gave lectures, which were numerously attended. Still his position was rendered unpleasant by the opposition which his more advanced views received, and in 1834 he resigned his appointment, when the hospital of University College was established, having been appointed professor of medical sciences in the college in 1831. This situation he held till 1838, when he resigned in consequence of the opposition raised to his system of mesmeric treatment of cases in that hospital. In 1849 a mesmeric hospital was established, of which he is the physician.

It is not our purpose here to enter into details of the many and violent disputes in which Dr. Elliotson has been engaged in consequence of his having adopted what was styled heterodox views and practice in medicine. His peculiarly active and energetic mind seems to have been ever open to the reception of novelties, but it must be admitted that in many cases, his adoption of them, however exposed to ridicule in the first instance, has not been without sufficient grounds. His advocacy of the use of prussic acid as a preventive of vomiting, and thus preparing the stomach for medicines it would otherwise reject; of the use of larger doses of quinine than had been previously administered; of iron in cases of chorea, and creosote in cases of vomiting and nausea; and of the use of auscultation; which were all opposed, and are now established. Of the most doubtful of his doctrines, that of the use of mesmerism in disease, we can only say that at least it must have been adopted conscientiously, as he sacrificed much to his belief, which he still practises according to, and energetically maintains its truth in, the pages of the 'Zoiæ.' His lectures were published in the 'Lancet,' and in the 'Medical Gazette;' and he has been a large contributor to the 'Medico-Chirurgical Transactions.' In 1817 he published a translation of Blumenbach's 'Physiology,' with annotations; these in subsequent editions became so numerous, and the modifications of the text so important, that at length the work appeared as 'Human Physiology, &c., with which is incorporated much of the elementary part of the Institutiones Physiologicae of J. F. Blumenbach.' In 1830 he issued his 'Lumleian Lectures, on the recent improvements in the art of distinguishing the various Diseases of the Heart,' which he had delivered before the Royal College of Physicians in the previous year. He is a Fellow of the Royal College of Physicians, a Fellow of the Royal Society, the founder and president of the Phrenological Society, and has been president of the Royal Medical and Chirurgical Society.

ELLIOTT, EBENEZER, the Corn-law Rhymer, was born March 17th, 1781, at the New Foundry, Maabro', near Rotherham, Yorkshire. His father, a clerk at the foundry, was an ardent politician and a stern ultra-calvinistic dissenter of the Berean sect; and he employed his "brother Berean, Tommy Wright, the Barnesley tinker" to baptise his son—as the poet relates in his 'Autobiography,' published soon after his death in the 'Athenæum' (January 12, 1850). The elder Elliott (also an Ebenezer) was accustomed to preach in his own room every fourth Sunday, to persons of a similar persuasion, who used to come twelve or fourteen miles to hear him; and on the week-days he "delighted to declaim on the virtues of slandered Cromwell and of Washington, the rebel," as he pointed to prints of them which hung on the walls: and here, as Elliott wrote, "is the key which will unlock all the future politics" of the Corn-law Rhymer. The young Ebenezer was regarded as a dull child, loved to be alone, made little progress at school, where he could never master grammar, or attain to vulgar fractions, was a frequent truant, and seemed to be a confirmed dunce; and eventually, out of sheer hopelessness, was sent by his father to work in the foundry. At the foundry work however he was thought to be even clever, but with the workmen's skill he acquired also the workmen's evil habits, and for awhile gave way to intemperance. But from sinking into thoroughly vicious courses his early love of nature saved him. A copy of Sowerby's 'English Botany,' lent him by an aunt, led him to collect botanical specimens, and after a while he became interested in poetry that treated of his favourite flowers, and of country scenes. He soon became a diligent reader, studying "after Milton, Shakspeare—then Ossian, then Junius," and soon, while "of Barrow," he says, "I was never weary; he and Young taught me to condense." In time too he began to write verses himself, though his early efforts, he confesses, were very unsuccessful; and he set himself doggedly to learn in his own way grammar, and even French,

but could master neither. Meanwhile he was not neglecting his ordinary duties. His father had been induced to purchase the foundry business on credit, and from his sixteenth to his twenty-third year Elliott "worked for his father as laboriously as any servant he had, and without wages, except an occasional shilling or two for pocket-money." It was while thus engaged that he composed (in his seventeenth year) his first published poem, the 'Vernal Walk'; this was followed soon after by 'Night,' 'Wharfedale,' and others; and Elliott, between his rhymes and politics, began to be a local celebrity. He had the good fortune to form the acquaintance of Southey, who was earnest in giving him the full benefit of his own wide experience in poetical studies, and Elliott was in after years proud of proclaiming that Southey taught him poetry. Happily for his lasting fame, he did not let his respect for the genius or his gratitude for the kindness of the laureate lead him to become an imitator, or to tame down his wild notes to the orthodox tunes. Between 'Wharfedale,' and the 'Corn-law Rhymes,' he published in 1823 'Love,' and another poem, accompanying them with a 'Letter to Lord Byron.'

Elliott's father was too much hampered by the liabilities he had incurred, and his want of capital, to carry on the foundry with success. After a time young Elliott commenced business at Rotherham on his own account; but failing there he removed to Sheffield, where in 1821 he, at the age of forty, recommenced the battle of life as a bar-iron merchant, with a borrowed capital of 100*l*. Here he had a series of commercial successes, built himself a handsome residence in the suburb of Upper Thorpe, and carried on a flourishing business till the great panic of 1837, when heavy losses caused him to contract the scale of his dealings. He finally withdrew from business in 1841, and retired to a pretty country residence he had built for himself on an estate of his own at Great Houghton, near Barnesley, and there he resided at ease in his circumstances, the centre and oracle of a circle of admiring friends, till his death, which occurred on the 1st of December 1840, having lived to see the great change effected in the commercial policy of the country which he had laboured so earnestly to bring about.

Elliott says of himself, in the 'Autobiography' already quoted: "There is not in my poetry one good idea that has not been suggested to me by some real occurrence, or by some object actually before my eyes, or by some remembered object or occurrence, or by the thoughts of other men, heard or read." And this is evidently true. All his poetry—all the true and living part of it at least—was suggested by some passing event, or was written to serve some temporary purpose. None of it is the result of a long meditated design, or the completely formed issue of a vivid and vigorous imagination; or, on the other hand, the unpremeditated melody of a heart imbued with happy thoughts and fancies—singing as the wild-bird sings. Nevertheless it is true, albeit often very harsh and rugged, poetry. It is the passionate protest against wrong—the fiery remonstrance with the wrongdoer—spurning the cold incumbrance of prose, and finding its only sufficient utterance in the unrestrained flow of poetry. The great public evil that came nearest home to his own hearth, that, as it seemed to him, which was inflicting dire mischief on the labouring classes of his own neighbourhood, and which was undermining the prosperity of the manufactures of his native place, and as he believed of the country generally, was the Corn-laws; and he resolved to set forth the mischiefs those laws were producing, and the greater dangers they were threatening. He had not been long settled at Sheffield when his 'Corn-law Rhymes' began to appear in a local paper, and their effect on the hard Yorkshire artisans was immediate and lasting. And their influence was assuredly well-earned. Rude and rugged in language, intensely bitter, even savage in their indignation, often, as might be expected, inconsiderate and sometimes unjust in their denunciations, they yet showed everywhere a thoroughly honest hatred of oppression, and fellow-feeling with the oppressed and suffering. With quite a Crabbe-like familiarity with the poverty of the poor, they displayed a far warmer, deeper, and more genial sympathy. The wrath and the pathos, too, uttered in the most impassioned and the most direct words, were yet conveyed in genuine music, which made its way at once to the heart. When from a local they appealed to the general public they were equally successful.

The 'Corn-law Rhymes,' published in a single volume with 'The Ranter,' at once made Elliott's name famous. Men of all shades of opinion joined in the admiration. The language was occasionally objected to, but it was generally felt that the language was really a part of the man. Noticing the objection in the preface to a new edition of the Rhymes, Elliott asked, "Is it strange that my language is fervent as a welding heat, when my thoughts are passions that rush burning from my mind, like white-hot bolts of steel?" But this, while a sufficient explanation of what reads so like excessive vehemence, serves really to take off the edge of his poetic declamation, while it destroys the impression of his prose, as placing within the category of passion what ought to be the result of reason. Elliott followed his 'Corn-law Rhymes' by publishing in 1829 the 'Village Patriarch,' another but longer corn-law rhyme, much the best of his longer pieces, and one which, with many faults, shows that he was capable of producing a great work, could he have subjected his mind to the necessary discipline. 'Love,' 'They Met Again,' 'Withered Wild-Flowers,' 'Ker-

honah,' a dramatic fragment, and numerous beautiful little pieces, in which descriptions of the scenery of his much-loved Yorkshire formed the most attractive part, followed; and in 1834 he published his collected works in three volumes. Three or four more editions of his poetry were called for during his life, and to the last he continued to write rhymes, epigrams, songs, and short snatches of verse, which usually appeared from time to time in the corner of a local newspaper or the pages of 'Tait's Magazine.' Since his death two volumes of his inedited remains have appeared under the title of 'More Prose and Verse, by the Corn-law Rhymers,' but they contain nothing that can materially add to his reputation. Two memoirs of him have been published, written by Sheffield friends: but his biography remains to be written; and it is greatly to be desired that a fitting biography should be written of one who is emphatically the poet of Yorkshire—of its moors and streams, its towns and townsmen—the poet of the corn-law struggle, and the poet of the poor.

ELLIS, GEORGE, was born in 1745, and early distinguished himself by his wit and ability. His first literary appearance was as one of the authors of the 'Rolliad,' to which he contributed the 'Birthday Ode;' the 'Ode on Dundas;' the poetical epilogue 'Charles Jenkinson;' and several of the 'Criticisms' and 'Epigrams;' he was also one of the writers of 'Probationary Odes;' and later he was, after Canning, one of the most prolific and piquant contributors of both verse and prose to the 'Anti-Jacobin.' While taking a lively interest in politics, he devoted his leisure to the study of our early literature; and few men have combined as wide a knowledge of English literature with as refined and genial a taste. In minute antiquarian details he has been far surpassed, but while he always displayed a competent knowledge, there was in him nothing of the pedantry of minute information, which often enables an inferior person to pass off as a better scholar than he really is. Sir Walter Scott, who was first introduced to Ellis in 1800, and who, in his poetical investigations, derived no little benefit from his critical skill and friendly assistance, declared that George Ellis was "one of the most accomplished scholars and delightful companions he had ever known;" and that seemed to be the estimate formed of him by those who were best acquainted with him. Mr. Ellis's principal works were his 'Specimens of Ancient English Poetry,' of which the first edition appeared in 1780, an enlarged edition in 1801, and a fourth edition in 1811; and 'Specimens of Ancient English Romances,' 3 vols. 8vo, 1805—two works which very largely contributed to bring about that increased study of our older writers which marked the early part of the present century, and had so important an influence in restoring to our current literature a healthier tone of thought and a more simple and masculine style. The 'Specimens of Ancient English Romances' was reprinted in 1843, in a very convenient form, in Mr. Bohn's generally well-edited 'Antiquarian Library;' but unfortunately the editor (Mr. Halliwell) thought proper to "silently amend" what he conceived to be "the various philological errors into which Ellis had fallen," and consequently the volume is worthless as a book of reference, as the reader is always at a loss to tell whether what he reads is the opinion of Mr. Ellis or of his editor. Mr. Ellis died on the 15th of April 1815. His epitaph was written by his warm friend George Canning, who however, before it was engraved, submitted it to Sir Walter Scott for revision. Mr. Ellis was a member of the Royal Society and the Society of Antiquaries.

ELLIS, SIR HENRY, was born in London in 1777. He received his early education at the Merchant Taylors School, and then proceeded to St. John's, Oxford, where he took his degree. In 1805 he married. About this period he became one of the assistant librarians of the British Museum; and the facilities which this position afforded him for pursuing those antiquarian researches, in which he took an eager interest, were manifested in several valuable publications. In 1813 a new and enlarged edition of Brand's 'Observations on Popular Antiquities,' in two quarto volumes, was edited by him. It was subsequently republished in a popular form in 1842. In 1816 he was entrusted by the Commissioners of Public Records to write the general Introduction to 'Domesday Book,' and he discharged this trust with an industry and care which renders this Introduction one of the most valuable aids to the proper understanding of that important survey. He was a contributor to the new edition of Dugdale's 'Monasticon,' commenced in 1817. In 1824 he published his first series of 'Letters illustrative of English History,' and a second series in 1827. In that year he was appointed principal librarian of the British Museum, an office which he filled with great efficiency, and with an urbanity which won for him the regard of all persons with whom his official duties brought him into communication. In the early part of 1856 he resigned this honourable post. He was for many years a member and joint-secretary of the Society of Antiquaries. His papers in the 'Archæologia' are numerous and most interesting. Sir Henry Ellis has thus been a large contributor to the literature of his country. Without striking into any new tract of antiquarian research, he has, during this long course of unwearied labour, produced most valuable contributions to the knowledge of our national antiquities. His classical knowledge enabled him to prepare four interesting volumes on 'The Elgin Marbles' and 'The Townley Marbles.' In 1832 he was created a Knight of the Royal Hanoverian Guelphic Order, and promoted in 1838 to the rank of Knight Bachelor.

ELLIS, REV. WILLIAM, whose name has become associated

with the progress of Christian missions in the Sandwich and South Sea Islands, became officially connected with the London Missionary Society in 1815. In November of that year Mr. Ellis married Miss Mary Mercy, a young lady who, under deep religious convictions, had been led to offer herself for missionary work before she became acquainted with her future husband and fellow-labourer. In December 1815 Mr. and Mrs. Ellis embarked at Portsmouth, and finally sailed from Spithead on January 23rd, 1816. The vessel in which they took their passage visited New South Wales and New Zealand, called at Tahiti, and reached the island of Kimeo about thirteen months after leaving England. From this period till October 1824, Mr. and Mrs. Ellis were constantly and zealously engaged in promoting the instruction and welfare of the natives of Raiatea, Huahine, and other of the South Sea Islands: Mr. Ellis visited in 1822 Hawaii, or Owhyhee, the chief island of the Sandwich group, and in the following year removed his family thither. The result of his acquaintance with the condition of the islands and the character of the population, he has given in a work of great interest, entitled 'Polynesian Researches.' Among other works brought out by the missionaries for the benefit of the natives, in 1823, a small book of hymns, in the native language, for use in religious worship, was prepared under Mr. Ellis's superintendence, and printed at the mission press at Oahu.

The health of Mrs. Ellis having become seriously affected, her husband found it necessary to leave the scene of their labours, and in October 1824 they set sail on board the 'Russell,' an American ship, and arrived at New Bedford, Massachusetts, in March 1825. The owners of the vessel declined remuneration for the passage, and by numerous persons in Boston and the neighbourhood Mr. Ellis and his family were treated with much kindness. During his residence in America he took part in public meetings on behalf of the missionary cause, the more readily that he had been on terms of cordial friendship with Mr. Stewart and other American missionaries at Honolulu, the capital of the Sandwich Islands. Mr. and Mrs. Ellis arrived in London in August 1825. Mrs. Ellis experienced occasional intervals of improvement in the state of her health, and her husband was occupied in connection with the business of the London Missionary Society at home. Mrs. Ellis died on January 18th, 1835. Mr. Ellis subsequently married Miss Sarah Stickney, a lady known as the author of several useful works on female education and the promotion of social improvement. Of these may be named 'The Women of England,' 'The Mothers of England,' and 'The Daughters of England;' 'Family Secrets, or How to Make Home Happy;' 'A Voice from the Vintage,' and other works bearing on the Temperance Reformation. Mr. Ellis being in poor health, and suffering from depression of spirits, paid a visit to Pau, accompanied by his wife, and the result of their residence there was published for the information of other excursionists, under the title of 'Summer and Winter in the Pyrenees.' They have since resided at Hoddesdon, Hertfordshire, where Mrs. Ellis has conducted an educational establishment for females. Among the more important of Mr. Ellis's productions may be named a 'History of Madagascar,' published in 2 vols. 8vo, in 1839, prepared by him from information received from the missionaries and from government official documents. The state of affairs in Madagascar having been much improved of late, and the profession of the Christian religion being now tolerated in that island, Mr. Ellis, who is in improved health, has recently proceeded to Madagascar on a mission of observation for the London Missionary Society. Among his other works are—'Narrative of a Tour through Owhyhee,' 1826; 'History of the London Missionary Society,' and 'A Vindication of the South Sea Missions from the Misrepresentations of M. von Kotzebue,' 1831; 'Village Lectures on Popery,' 1851; and an interesting memoir of the first Mrs. Ellis, published in 1835.

* ELLIS, WILLIAM, claims a place in this work, not merely as a writer on Social Science, but as having been the means of introducing it into schools as an important branch of elementary education. He was born in the vicinity of London in 1800. The son of a gentleman engaged in commercial pursuits, he was early placed in a mercantile office, and soon acquired such a position among commercial men, that, at the age of twenty-six, he was appointed manager of a marine insurance office—a post he has ever since held, the office under his management having become one of the most successful establishments of its kind in the metropolis. But commercial pursuits did not at any time entirely engross his thoughts. His attention was in early life drawn to the subject of political economy by the circumstance of his copying for Mr. Tooke (who was a friend of his father) the manuscript of his work on Prices; and it was for Mr. Ellis a fortunate circumstance that, while involved in the difficulties which that mass of facts was sure to present to a young inquirer, he found no less able a guide than the late James Mill, under whose advice he prosecuted the study with great ardour and with corresponding success. And here perhaps it may be worth while to call attention to one fact in Mr. Ellis's history, which, besides exercising probably a very powerful influence in the moulding of his opinions, both on literary and political subjects, has certainly impressed a marked character upon his educational efforts. His study of economic science in early life, like his teaching of it in his riper years, was not a thing of books merely. Not undervaluing books, yet not content to rest his belief on authority as such, he investigated for himself, and so conducts his lessons that

the boys do really investigate for themselves. The conclusions of the writers on political economy were in his hands propositions for investigation. He tried them against the phenomena of industrial life, as his daily commercial experience gave him opportunity; and the knowledge so gained has rendered him one of the discoverers in the science, as well as perhaps one of its most zealous and able advocates. And when we call to mind the great social changes of the present century, it will not be difficult to understand how large the field, and how important the subjects on which Mr. Ellis's observation has been exercised. In his boyhood Mr. Tooke put him in possession of all that was then understood of Bank restriction acts and a depreciated currency. Since then he has seen our currency, as at present established, assailed in every panic from that of 1825 to that of 1848; and during the same period there have passed under his scrutiny all the great strikes by which workmen have been deluded into the hope of alleviating the sufferings incident to insufficient wages. These evils induced Mr. Ellis to make some attempt at removing them; and further impelled, it may be, by the kindly feelings towards children which form a prominent feature in his character, he determined, if possible, to introduce into schools such instruction as should send boys into the world furnished with intelligent thoughts upon all the great questions relating to industrial life. With this view he began in 1846 a series of lessons to the elder boys of a British school to which for some years previously he had been accustomed to render assistance; and about the same time he also gathered round him a group of schoolmasters with whom he went over the course of inquiry which will be found in his 'Progressive Lessons;' and these 'Lessons' will also furnish a good illustration of the mode of teaching adopted. The boys had no tasks to learn by rote, but the whole of the subjects brought before them, with the exception of things merely technical and arbitrary, were, so to speak, developed by the boys themselves, they being guided in their inquiries of course by the questions of the teacher. Thus these lessons came to be something more than the mere teaching of dry academical political economy. They assumed in fact the character of moral lessons. For, thus taught, not only do children learn as a matter of fact about what is going on as the everyday work of industrial life, but they are continually invited to investigate what ought to be the rule of conduct of those who are engaged both in production and distribution. Not only, for example, would children learn the fact that the merchant does buy in the cheapest and sell in the dearest market, but the questions would come, 'Ought he to buy in the cheapest market?' 'Ought he to sell in the dearest market?' 'Why? or why not?' And such questioning, as may easily be perceived, when managed by a competent teacher, tends to a high order of mental and moral training.

Having thus "satisfied himself that social science may be made attractive to intelligent boys . . . and feeling certain that the habits of reflection and self-examination, which its study calls forth, cannot fail to impart a useful bias to their character and conduct in after-life," Mr. Ellis proceeded to establish schools in which instruction in social science should be a leading feature. The Birkbeck schools are all his, and, with the exception of the one in the London Mechanics Institute, they have been established, and one of the largest of them erected, wholly at his expense. Besides these, there are many schools about the country that have been influenced by his books or his teaching; and his views have found, or are finding, acceptance with all the leading educationalists of the day.

As supplementary to his 'Lessons,' and to assist teachers in giving similar lessons, Mr. Ellis prepared a series of elementary works on social science. Of these the principal are—the 'Outlines of Social Economy;' 'Introduction to the Study of the Social Sciences;' 'Outlines of the History and Formation of the Understanding;' 'Questions and Answers, suggested by a Consideration of some of the Arrangements of Social Life;' and 'Progressive Lessons in Social Science.' The most recent of these introductory works, the 'Phenomena of Industrial Life,' edited by the Dean of Hereford, might be taken as an epitome of what Mr. Ellis has taught and is teaching as social science. He has also written 'Education as a Means of preventing Destitution,' and some other pamphlets, besides contributing some articles to the 'Westminster Review.'

ELLISTON, ROBERT WILLIAM, was born in Bloomsbury, London, on the 7th of April 1774. His father was a watchmaker, one of whose brothers was Master of Sidney Sussex College, Cambridge. Young Elliston was placed at St. Paul's School, where he distinguished himself by recitations; but, when he was the fourth boy, he ran away from school, became for a few weeks a lottery-clerk at Bath, and in that town, in April 1791, appeared on the stage for the first time, personating a very humble character in 'Richard the Third.' He then obtained an engagement in the company of Tate Wilkinson at York: but, soon becoming tired of playing petty parts, he obtained through his uncle a reconciliation with his family, and returned home. But the truant disposition was invincible. In the season of 1793 he played regularly at Bath, undertaking characters of all sorts: and in 1796 he married Miss Rundall, a teacher of dancing there. In June of that year he made his first appearance on a London stage, playing at the Haymarket, in the same evening, the part of Octavian, and that of Vapour in the farce of 'My Grandmother.' After occasional appearances in that theatre, and a temporary engagement at Covent-Garden,

he became in 1803, under Mr. Colman, principal actor and acting manager of the Haymarket. Next year he succeeded John Kemble at Drury-Lane; but, after the burning of the theatre, he quarrelled with Thomas Sheridan and left the company. He now took on his own account the small house then occupied as the Circus, to which he gave the name of the Surrey Theatre. There he and his company performed some of Shakspeare's plays and several operas, altering them so as to evade the licence of the patent theatres; and in 1805 he published his only literary effort, 'The Venetian Outlaw,' a drama, in three acts, adapted from the French.

On the reopening of Drury-Lane Theatre, Elliston, again a leading actor in its company, delivered Byron's address and performed 'Hamlet.' In 1819 he became the lessee of that theatre, at a rent of 10,200*l.*; and he held this lease till his bankruptcy in 1826. From the date of that event he sunk into a subordinate position. After speculating in the Olympic Theatre, he became again manager of the Surrey; and there, till near the close of his life, he continued occasionally to perform. He died of apoplexy on the 7th of July 1831.

Elliston has been asserted, not without some show of reason, to have been the very best comedian of our time. Others surpassed him in particular excellences; but none united so many of the merits essential to eminent success in the highest walk of comic acting. So, likewise, he rose higher perhaps in tragedy than any other actor who was distinguished for excellence in comedy: he was admirable in those tragic parts which do not pass altogether out of the sphere of ordinary life. The weaknesses and eccentricities of his own character have furnished to Charles Lamb and others the themes for an infinite fund of good-humoured raillery. His predominant failing was inordinate self-esteem. He was vain of himself as an actor, vainer of himself as a manager; and in both phases his vanity was continually breaking out in incidents which, while they were irresistibly diverting, exhibited a humorous whimsicality, and a ferid sincerity of self-deceiving imagination, making him one of the most curious objects upon which a kindly observer of human oddities could exercise his scrutiny.

ELMES, JAMES, was formerly in practice as an architect, and was at one time surveyor and civil engineer to the port of London. He was born in the city of London on the 15th of October 1782, and acquired a knowledge of building under his father, and of architecture under Mr. George Gibson. He gained the silver medal in architecture at the Royal Academy in 1804, and afterwards designed and carried out public and private buildings in London, and the neighbouring counties, and in Ireland. He relinquished his principal office, and that of vice-president of a society "for the diffusion of the knowledge of the Fine Arts among the people" in 1828, through loss of sight, which however he partially recovered a few years since. Mr. Elmes is the author of a memoir of the 'Life and Works of Sir Christopher Wren,' published in 1823. More recently he has published a volume on 'Sir Christopher Wren: his Life and Times.' He is also the author of well known works on The Law of Dilapidations, and on Architectural Jurisprudence; and has printed a volume of 'Lectures on Architecture,' a 'General and Bibliographical Dictionary of the Fine Arts,' 'Elmes's Quarterly Review,' 'The Annals of the Fine Arts,' and other works, with some of which Haydon was connected as contributor and projector. He also supplied the literary matter for Jones's 'Metropolitan Improvements in London in the 19th Century,' and articles on Bridge Building and other subjects for the 'Encyclopædia Metropolitana.' One of his latest works, 'Thomas Clarkson: a Monograph,' appeared in 1854.

ELMES, HARVEY LONSDALE, son of the preceding, was born near Chichester, about the year 1814. He was sent to school at Mortlake in Surrey, and subsequently was taken into the office of his father, who had removed to London; and at the age of twenty-one he joined his father in partnership, and together they designed and superintended buildings in Park-street and the South Mall, St. James's Park. His independent fame dates from his success in the competition for the building of St. George's Hall, Liverpool; his design being chosen from the drawings of eighty-six competitors. He was then aged twenty-three. The building was at first intended for a music hall only, and a foundation stone was laid on the 28th of June 1838, though not quite on the present site. A competition for the Assize Courts shortly succeeded the other; and in this also Elmes was successful, there being seventy-five competitors. It was however decided to erect one grand edifice, and for this a fresh design by Elmes was approved of in 1841, when the work at length commenced. It was carried on under the architect's direction till the year 1847, when he was obliged to succumb to the encroachments of a fatal malady, and, after a brief sojourn at the Isle of Wight, he quitted England for Jamaica, with the hope of restoration in a warm climate, but died at Spanish Town on November 26, 1847, in the thirty-third year of his age. He had delegated the superintendence of his great work during his expected absence, to his friend Mr. R. Rawlinson, Mr. Cockerell having agreed to attend to architectural detail. Under the first of these gentlemen the hall was arched over, contrary to many predictions which the architect had borne the brunt of—feeling probably that what had been accomplished in the works of the Romans should be allowed to present no insurmountable difficulty in the present century. The present decorative character of the interior, and some of the external accessories, are due to Mr. Cockerell, who also designed the sculpture of the pediment.

To understand the importance of Elmes's great work, it would be necessary to review the history of architecture, and especially the adaptation of Greek models, during the course of some years preceding the date of the St. George's Hall design. The proper use of ancient models had been completely lost sight of, and especially as to Greek architecture. In many parts of the kingdom buildings were erected, supposed to be classical, but which realised neither art nor the lower quality, the very imitation. Thus an idea had begun to prevail that the Greek system was so limited in its scope, whilst at variance with modern requirements, as to be in itself the cause of the failure in certain ambitious productions. Elmes however repeated the proof how that it is possible to use the works of preceding minds, and yet to realise the grandest new conception. Considered as to the attributes of art, Elmes's work is more Greek than many modern buildings which may exhibit even accurate reproduction. The design may well be claimed by this country as amongst the noblest efforts of architecture in Europe.

After years spent most worthily in the pursuit of art, Elmes had not realised anything commensurate with the extent and merit of his exertions. An average of 450*l.* a year, subject to deductions for travelling, clerks, office and other heavy expenses, was all that one who had the highest gifts, received from that work which forms the chief adornment of a rich provincial town; and after his death a subscription was raised to provide a moderate income for his wife and child.

ELMORE, ALFRED, A.R.A., born in 1816, at Clonakitty, Cork, first attracted attention in London by the pictures of the 'Crucifixion,' exhibited at the British Institution in 1838, and the 'Martyrdom of Thomas à Becket,' painted for Daniel O'Connell, and exhibited at the Royal Academy in 1840. Mr. Elmore now went for a while to study the great historic painters at Rome, and on his return in 1843 sent a picture without a title to the Academy. From this time he has been a tolerably regular contributor to the walls of the Royal Academy, but he has selected a somewhat lower branch of the historic art for his special culture than his early essays promised. His chief pictures have been—'Rienzi in the Forum,' 1841; 'The Origin of the Guelph and Ghibeline Quarrels at Florence,' 1845, which secured his election the following November as Associate of the Royal Academy; 'The Fainting of Hero,' 1846; 'The Inventor of the Stocking-Loom,' 1847 (this, perhaps the most popular of Mr. Elmore's pictures, has been very well engraved); 'The Death-bed of Robert King of Naples,' 1848; 'Religious Controversy in the time of Louis XIV.,' and a subject from 'Tristram Shandy,' 1849; 'Griselda,' and a subject from the 'Decameron,' 1850; 'Hotspur and the Fop,' 1851; 'A Subject from Peppe's Diary,' 1853; 'Queen Blanche ordering her son Louis IX. from the presence of his Wife,' 1853; and 'The Emperor Charles V. at Yuste,' 1856, a very skillful rendering of a passage from Stirling's 'Cloister Life of Charles V.,' but having the fault too common with Mr. Elmore's works, of requiring a commentary to render its intention clear—a fault not in any degree dependent on the composition or execution of the painter, but inherent in the choice of subject.

ELMSLEY, PETER, was born in 1773, and educated at Westminster and Oxford. In 1798 he was presented to the chapelry of Little Horkeley, in Essex. By the death of his uncle Elmsley, the well-known bookseller, he succeeded to a competent fortune, which enabled him to live in independence, and devote his whole time to literary pursuits. For some time after his uncle's death he resided in Edinburgh, and was one of the earliest contributors to the 'Edinburgh Review.' The articles on 'Wyttenbach's Plutarch,' 'Schweighäuser's Athenæum,' 'Blomfield's Æschylus,' and 'Porson's Hecuba' are generally understood to have been written by him. While at Edinburgh he superintended an edition of Herodotus (1804, 3 vols. 12mo), in which he gave the first proof of the love of Atticisms which always distinguished him, by introducing into the text the Attic forms of the tenses, in spite of all the manuscripts. He was also an early contributor to the 'Quarterly Review': his paper on 'Markland's Euripides' (in the seventh volume) is well-known to scholars. As soon as the state of Europe permitted, Elmsley went abroad, and collated manuscripts in the continental libraries. He spent the whole of the winter of 1818 in the Laurentian library at Florence. In 1819 Elmsley was appointed by the government to assist Sir Humphry Davy in unrolling and deciphering the papyri at Heroulaeum; but the attempt was not attended with success, and in the prosecution of his duties Elmsley caught a fever, from which he never fully recovered.

On his return to Oxford he became Principal of St. Alban's Hall, and Camden Professor of Modern History in that university. He died of a disease of the heart on the 8th of March 1825. Elmsley's acknowledged works were editions of Greek plays. He published the 'Acharnians of Aristophanes' in 1809; the 'Œdipus Tyrannus of Sophocles' in 1811; the 'Heracleids, Medea, and Bacchus of Euripides' in the years 1815, 1818, and 1821; and the 'Œdipus Coloneus of Sophocles' in 1823. His transcript of the 'Florentine Scholia on Sophocles' was published after his death. As a scholar, Elmsley did not pretend to be more than a follower of Porson, but he did far more for Greek scholarship than any English scholar who followed that great critic. His character has been drawn with great truth by the celebrated G. Hermann of Leipzig (in the 'Wien. Jahrbücher,' vol. liv., p. 236):—"The way laid open by Porson was pursued and enlarged

by P. Elmsley, a man worthy of all honourable mention as well on account of his sound scholarship, as his great fairness and earnest love of truth. We owe to his unweariable accuracy and great application a rich treasure of excellent observations on the Attic dialect; and if he was too fond of making general rules, and for the sake of these rules introducing many wrong and unnecessary emendations, we should remember how easily diligent observation induces one to form a rule, and how easily the adoption of a general rule inclines one to set aside all deviations from it. But Elmsley had too much good sense and too sincere a love of truth not to turn back from his error, and to use it only for a confirmation of the truth and a new advance on the right way: and of this he has given many proofs."

ELPHINSTONE, WILLIAM, founder of King's College, Aberdeen, was born at Glasgow in 1437. His father, whose name he bore, entered into holy orders on the death of his wife, and was first rector of Kirkmichael, and at length archdeacon of Teviotdale, in which station he died in 1486, being then also, as it seems, provost of the collegiate church of St. Mary's, Glasgow.

At the head of those who in *congregatione* confirmed the statutes of the faculty of arts in Glasgow college, on the erection of that seminary in 1451, stands the name of William Elphinstone, Dean of Faculty. This was, no doubt, the archdeacon of Teviotdale. Among those incorporated in the university the same year appears also the name "Will^m. Elphinstoun," in all probability the youthful Elphinstone, who, it is admitted on all hands, was educated at the University of Glasgow. Here he passed A.M. probably in the twentieth year of his age. (Keith's 'Bishops,' p. 116.) Afterwards, applying himself to theology, he was made priest of St. Michael's, or Kirkmichael, Glasgow, in which place he served four years, and then proceeded to France, where, after three years study of the laws, he was appointed professor of law, first at Paris and then at Orleans. He continued abroad till 1471, when he returned home at the earnest request of his friends, particularly Bishop Muirhead, who thereupon made him parson of Glasgow and official of the diocese.

On Muirhead's decease, in the end of 1473, the archbishop of St. Andrews made him official of Lothian, which he continued to be till the year 1478. In the spring of that year we find John Otterburn in the office; yet in June following Mr. Elphinstone is marked in the parliament rolls as official of Lothian, and in that capacity elected *ad causas*. He was also made a privy councillor. About the same time he was joined in an embassy to France with the Earl of Buchan and the Bishop of Dunblane, to compose some differences which had arisen between the two crowns; and on his return, in 1479, he was made Archdeacon of Argyle, and then Bishop of Ross, whence, in 1484, he was translated to the diocese of Aberdeen.

The same year, as Bishop of Aberdeen, he was one of the commissioners from Scotland to treat of a truce and matrimonial alliance with England, whither he was again despatched as an ambassador on the accession of King Henry VII. When affairs at home came to be troubled between the king and his nobles, he took the part of the former; and when the Earl of Argyll was sent on an embassy into England, he was, on the 21st of February 1488, constituted lord chancellor of the kingdom, in which place however he continued only till the king's demise in June following. In October of the same year he was in the parliament then held at Edinburgh, where we also find him assisting at the coronation of the new king. He was afterwards sent on an embassy to Germany; and on his return thence was appointed to the office of lord privy seal, where he seems to have remained till his death, which happened at Edinburgh on the 25th of October 1514, while negotiations were pending with the court of Rome for his elevation to the primacy of St. Andrews.

Besides a book of canons, extracted out of the ancient canons, Elphinstone wrote a history of Scotland, chiefly out of Fordun. He wrote also some lives of Scotch saints; and in the college of Aberdeen are preserved several large folio volumes of his compilations on the canon law. The civil and canon laws indeed were his favourite studies, and to their establishment as the laws of Scotland he long and steadily directed his attention. It is to him we may in all probability ascribe the crafty acts 1437, c. 106, seq. to recover the former large jurisdiction of the chancellor and court of session, as well as the act 1494, c. 54, the object of which appears to have been to enforce in the courts the study of the Roman laws; and we shall not perhaps greatly err in conceiving his zeal to have been employed in the erection of the Court of Daily Council in 1503. It was moreover at his solicitation that the convent of Grey Friars at Stirling and the Chapel Royal were founded in 1494, the same year in which he also obtained a papal bull for the erection of a university at Aberdeen, in place of the narrow seminary previously existing there. To Bishop Elphinstone Aberdeen also owes another great work, namely the bridge across the river Dee: to the completion of his plans the prelate left 10,000*l*. Scots in money lying in his coffers at his death.

ELSEIMER, or ELZHEIMER, ADAM, was born at Frankfurt in 1574, and, according to the most probable account, died in 1620; but the statements of writers on the subject differ extremely. Finding that he was not likely to acquire in his own country that knowledge of the art which he saw to be necessary, he resolved to go to Rome, where he soon formed an intimacy with Pinas, Lastman, Thomas of Landau, and other eminent painters. Having carefully examined the

curiosities of Rome and the works of the greatest artists, both ancient and modern, he formed a style of painting peculiar to himself; this was the designing of landscapes with historical figures on a small scale, which he finished in so exquisite a manner that he was not only far superior to all his contemporaries, but is probably unrivalled in his own line by any artist of subsequent times. He designed entirely after nature; and a retentive memory enabled him to recollect everything that had struck him, and to make a judicious use of it in his compositions. Allowing for a certain conventionalism, it is difficult to speak in too high terms of the rare union of excellences in the works of Elsheimer; he is equally admirable for the fine taste of his design, the correct drawing of his figures, the lightness, spirit, and delicacy of his touch, the beauty of his colouring, the high finishing of his works, so that the minutest parts will bear the closest inspection, and his skilful management and distribution of light and shade, and thorough knowledge of the principles of chiaroscuro, which was manifested in his pieces representing scenes by torch or candlelight, moonlight, sunrise, or sunset. Even during his lifetime his pictures bore a very high price, but the price was considerably increased after his death. Yet it is said that he was unable to acquire even comfort by the exercise of his talents. He had a large family; and though he received high prices for his works, he spent so much time and labour upon them, that he could not subsist by what he earned. He was at length cast into prison for debt; and though very soon released, the disgrace of the confinement preyed on his spirits, and he sunk under his misfortunes. The Italians, who highly honoured and esteemed him, deeply regretted his untimely death; and his friend Thomas of Landau was so grieved at his loss that he could no longer bear Rome, but retired to his own country. Old Teniers and Bamboccio are considered to have been indebted for great part of their excellence to their study of the works of Elsheimer.

ELSTOB, WILLIAM, descended from an ancient family in the county of Durham, was born at Newcastle-upon-Tyne, January 1, 1673. His father was Mr. Ralph Elstob, a merchant of that place. He received his earliest education in his native town, but was afterwards sent to Eton, and thence to Catherine Hall, Cambridge. Being of a consumptive habit, and the air of the place not agreeing with him, he removed to Queen's College, Oxford, whence in 1696 he was chosen fellow of University College. In 1701 he translated the Saxon Homily of Lupus into Latin, with notes, for Dr. Hicke; and about the same time he translated Sir John Cheke's Latin version of Plutarch's treatise on 'Superstition,' which was printed at the end of Strype's life of Cheke. In 1702 he was presented by the dean and chapter of Canterbury to the rectory of the united parishes of St. Swithin and St. Mary Bothaw, in London, where he continued till his death. In 1703 he published at Oxford an edition of Roger Ascham's 'Letters;' and in 1709, in the Saxon language, with a Latin translation, the Homily on St. Gregory's day. He intended the publication of several other works in Saxon literature, more particularly the Saxon laws, and Alfred's paraphrastic version of Orosius. He died March 3, 1714-15. He published one or two other works, but of less consequence than his Saxon labours.

ELIZABETH ELSTOB, sister of the above, was born at Newcastle, September 29, 1683. During her brother's continuance at Oxford she resided chiefly in that city with him, and afterwards removed with him to London, where she joined him in his Saxon studies. The first public proof she gave of this was in 1709, when, upon her brother printing the Homily upon St. Gregory's day, she accompanied it by an English translation and a preface. Her next publication was a translation of Madame Scudery's essay on 'Glory.' By the encouragement of Dr. Hicke, she undertook a Saxon 'Homiliarium,' with an English translation, notes, and various readings, of which a few sheets only were printed at Oxford, in folio, when the work was abandoned. Her transcript of the Saxon homilies, in preparation for this work, is preserved in the Lansdowne Collection of Manuscripts in the British Museum. In 1715 she published a Saxon grammar in quarto, the types for which were cut at the expense of Lord Chief Justice Parker, afterwards earl of Macclesfield. After her brother's death, Miss Elstob retired to Evesham in Worcestershire, where she subsisted with difficulty by keeping a small school under a feigned name. Each scholar paid her fourpence a week. She was subsequently patronised by Queen Caroline, who granted her a pension of 20*l*. a year, but this bounty died with the queen. In 1739 the Duchess Dowager of Portland took Miss Elstob into her family as governess to her children, where she continued till her death, May 30, 1756. She was buried on the 3rd of June at St. Margaret's, Westminster. (Pegge, *Account of the Textus Ruffensis*, and of Mr. Elstob and his Sister, in the *Bibl. Top. Brit.*, No. xxv.; Kippis, *Biog. Brit.*; Tindal, *History of Evesham*; Nichols, *Literary Anecdotes*; *Notes and Queries*, vol. ix. and x.)

ELYOT, SIR THOMAS, one of the best writers of the time of Henry VIII., was the son of Sir Richard Elyot, of the county of Suffolk, according to the received accounts, but as it would seem from a passage in Leland's 'Collectanea,' iv. 141, and an inquisition in the Exchequer (cited in 'Notes and Queries,' viii. 276), of Wiltshire. Thomas Elyot received his university education at St. Mary's Hall in Oxford. He afterwards travelled through Europe, and upon his return was introduced at the court of Henry VIII., who conferred upon him the honour of knighthood, and subsequently employed him in several embassies, particularly to Rome in 1532 in the affair of the divorce,

and afterwards in 1536 to the emperor Charles V. Sir Thomas Elyot's literary and philosophical attainments were various, and he was courted by most of the learned men of his time, and by none in a more friendly manner than by Sir Thomas More. He died in 1546, and was buried in the church of Carleton in Cambridgeshire, of which county he had been sheriff.

From a letter of Sir Thomas Elyot to Secretary Cromwell, among the Cottonian Manuscripts in the British Museum, it appears that Wolsey made him clerk of the king's council.

Sir Thomas Elyot's works of greatest note were his book named the 'Governor,' his 'Castle of Health,' and his 'Dictionary,' all of which went through numerous editions between 1531 and 1580. He also published a small treatise 'Of the Knowledge which maketh a Wise Man,' 8vo, London, 1533; and 'The Banquet of Sapience,' 8vo, 1545; besides several translations from Plutarch, Isocrates, St. Cyprian, &c.

ELZEVIERS, the name of a family of celebrated printers and publishers at Amsterdam, Leyden, the Hague, and Utrecht, who adorned the republic of letters with many beautiful editions of the best authors of antiquity. The right name of the family was Elsevier. They are believed to have come originally either from Liege or Louvain. In neatness and in the elegance of small type they exceeded even the family of the Stephens. [STEPHENS.] Their Virgil, their Terence, and their Greek Testament, are considered the masterpieces of their productions; but the Virgil is said to be incorrect.

The first trace of the name of Elsevir is found in an edition of Eutropius, printed in 1592, published at Leyden by Louis Elsevir, who was still living there in 1617. Matthew, his eldest son, died at Leyden in 1640. Giles, his second son, was a bookseller at the Hague in 1599. Isaac, the eldest son of Matthew, was the first printer of his family, and printed from 1617 to 1628. Abraham and Bonaventure, the third and fourth sons of Matthew, were printers and booksellers. Bonaventure was a partner with his father in 1618, and occurs associated with his brother Abraham in 1626. The set of Elsevirs which the French call 'Les Petites Républiques,' the 'Accounts of the Nations of the World,' were published by Abraham and Bonaventure, and in fact gave to the family their celebrity. Their brother Jacob printed at the Hague in 1626. Both Abraham and Bonaventure died at Leyden in 1652. Louis, the second of the name, the son of Isaac, was established as a printer at Amsterdam from 1640 to his death in 1662. Peter, the son of Arnout, the second son of Matthew Elsevir, printed at Utrecht in 1669, and was living in 1680. John and Daniel were sons of Abraham, and printed in partnership in 1652; but John printed alone in 1656, when Daniel appears to have been associated with his cousin Louis. John died in 1661; Daniel in 1680. Daniel left children who carried on the business, but passed for the last of the family who excelled in it. Their descendants still remain, but no Elsevir has for considerably over a century been engaged in printing. Isaac Elsevir was governor of Curaçao in 1820.

The Elsevirs printed several catalogues of their editions; but the best, as being the latest lists and accounts of them, are contained in the 'Notice de la Collection d'Auteurs Latin, Français, et Italiens, imprimée de format petit en 12mo, par les Elsevier,' in Brunet's 'Manuel du Libraire,' 3rd edit., 8vo, Paris, 1820, vol. iv. pp. 533-567; and in Berard's 'Essai Bibliographique sur les Éditions des Elseviers, précédé d'une Notice sur ces Imprimeurs Célèbres,' 8vo, Paris, Didot, 1822. See also Pieters, 'Analyse des Matériaux les plus utiles pour de futures Annales de l'Imprimerie des Elsevier,' Gand., 1848; De Baume, 'Recherches historiques, genealogiques, et bibliographiques sur les Elsevier,' Bruxelles, 1847; Ch. M. [Motteley], 'Aperçu sur les Erreurs de la Bibliographie Speciale des Elseviers et de leurs Annexes,' Paris, 1849; Brunet in 'Nouv. Biog. Gen.', 1856.

The usual imprint upon the Elsevir editions is either 'Apud Elseviro,' or 'Ex officina Elseviriorum,' or 'Elseviriana,' the names of the different branches of this family are rarely found in the title-pages of their editions. 'Else' in Dutch signifies an elm, and, by extension of signification, wood in general; 'vuur' is fire. These words explain a device of a wood-pile burning in the title-pages of some of the Elsevir productions, as in that of the Sleidanus, 1631; of 'Census de Republica Hebræorum,' 1632; the Cæsar and Terence of 1635; the 'Memoirs of Comines,' &c.

EMERSON, RALPH WALDO, the son of a Unitarian clergyman at Boston, United States, was born about 1803. Having graduated in his eighteenth year at Harvard University, Mr. Emerson accepted an invitation to become the pastor of a Unitarian church in his native city. For some seven or eight years he continued to discharge the duties of this office, when differences of opinion respecting some of the forms of worship and points of creed, led to the severance of the connection; and, abandoning the ministry, he retired to the village of Concord, where he gave himself up to the free investigation of the principles of theology, of morals, and of philosophy. During some winters he lectured in Boston, and he contributed to the 'North American Review' papers on the great writers and artists of Europe. But it was not till the publication of his 'Nature,' in 1836, that his original strain of thinking began to be recognised. In August 1837 he delivered an oration before the Phi Beta Kappa Society, Cambridge, U.S., on 'Man Thinking,' which produced a marked sensation, and this was diffused throughout the intellectual circles of America on its publication. On a Sunday evening in July 1838 he delivered an

address before the senior class in Divinity College, Cambridge, in which he treated of man and his relations to the universe, of Christ and Christianity, the present condition of religion, and like lofty subjects from the most transcendental point of view; laying down at the same time a "sublime creed," which has been described as an "idealistic pantheism." It was at any rate a great advance on any theory of philosophical religion which had yet been put forth in America, although American theologians and metaphysicians had been by no means timid in their enterprises in that direction. Contemporaneously with the 'Address,' appeared an oration entitled 'Literary Ethics,' delivered a few days after the 'Address' before the Literary Societies of Dartmouth College, in which the same style of thought was pursued; and the literary student, like the divine, was urged to put off the past, or "blend it with the new and divine life, and grow with God." Profound was the impression everywhere produced by these addresses, and Emerson soon came to be looked up to by a large section of the young theological students and literary men of America as their guide and master, while the orthodox regarded him with something like horror. These remarkable productions soon reached England, and found much acceptance as well as stirred up much opposition here; but to the majority they appeared to be a scarcely intelligible rificamento of the speculations of Coleridge and Carlyle, with a seasoning of German transcendentalism; and though Emerson has doubtless influenced to a certain extent the substance and the style of English literature, the influence began at a later period, and has not extended very far.

In 1840 Mr. Emerson commenced the publication of a monthly magazine called the 'Dial,' in which religion, philosophy, and literature were freely discussed: it lasted four years. In 1841 he published 'Man the Reformer,' a lecture; 'The Method of Nature,' an oration delivered before the Society of the Adelphi, in Waterville College, Maine; 'Lectures on the Times,' and the first series of his 'Essays.' His second series of 'Essays' appeared in 1844, and he also gave some lectures on 'New England Reformers,' 'Negro Emancipation,' &c. In 1846 he published a volume of poems, containing much that is very striking along with much that is in hardly any sense poetical. In all these publications there was the same resolute self-dependency, the same fearless condemnation of the master evils of American society, the same eager calls to live and work under an abiding sense of duty without regard to public opinion, which gave so fresh and vigorous a tone to his earlier public addresses, and, it must be confessed, the same crudeness of thought and obscurity of expression.

In 1849 Mr. Emerson visited England, and met with a very cordial reception from the literary and general society of the metropolis. Whilst here he delivered a series of lectures, which formed the substance of his volume entitled 'Representative Men.' Here, as in his previous volumes, there was much of mysticism, much that was obscure, paradoxical, strange; but when speaking of men whose names are common property,—of Shakspeare and Göthe, of Napoleon and Montaigne,—where he laid aside the 'terminology' of his metaphysics, there was much that to every mind seemed as true and impressive as it was novel and graceful. But here, as in his orations and essays, or even more than in his orations and essays, the sense of an oppressive vagueness and insufficiency was predominant. Nothing of much consequence has since appeared from the pen of Mr. Emerson, unless it be his portion of the strangely-constructed 'Memoirs of Margaret Fuller'; but he is still found ready to lift up his voice against any social wrong, or to aid in eradicating any popular prejudice.

EMERSON, WILLIAM, an eminent mathematician, philosopher, and mechanist, was born at Hurworth, a village about three miles from Darlington, in June 1701. He died May 20th, 1782, at his native place, aged nearly eighty-one years.

His father, Dudley Emerson, was a schoolmaster, and is said to have been a tolerable proficient in the mathematics of that time: this circumstance furnished his son with ample means of cultivating his taste for the same science, both by means of a good mathematical library which his father possessed, and the good mathematical tuition which he received in his earlier years. A young clergyman, then curate of Hurworth, also lodged in his father's house, and from him he received all requisite assistance in the study of the Greek and Roman classics, in which he became well versed.

After the death of his father, Emerson attempted to continue the school, which however he soon relinquished; but whether it arose from the impetuosity of his temper, which rendered him unfit, for such an occupation, or that a small competence left him by his father (he being an only child) rendered it a matter of indifference to him to increase his income, cannot be ascertained. He devoted his long life to writing a series of mathematical works, which, except those of Simpson, were, till a comparatively recent time, the very best in our language. He also contributed largely to the different mathematical periodicals of his time, though almost always under some fanciful name, as Merones, Philoquentimecanalgeomeastrolongo, &c.

Mr. Emerson was in person rather short, but strong and well formed, with an open honest countenance and ruddy complexion. A portrait of him, by Sykes, was painted and engraved in the latter part of his life; but it is not often to be met with, as only a few copies of it were

circulated. His health was generally excellent till near the latter part of his life, when he became a great sufferer from the stone.

Emerson was in many respects a very eccentric person, fancifully coarse in his dress, and uncourteous in his conversation. He was nevertheless, when in his happier moods, a delightful companion, and his discourse full of instruction, deep thought, and startling originality of opinion.

All his books were published in London; and it was his invariable practice to walk to town and shut himself up in some obscure lodging to devote himself sedulously to the correction of the successive sheets of his works with a care never exceeded even by Hamilton or Cruden; and certainly, of all the mathematical works that have ever been published, those of Emerson are the freest from errata.

Emerson was married, but had no children. He amused himself with fishing, a diversion to which he was much attached, and would frequently stand up to his middle in the water for hours together when he found it gave him a better position for the use of his fly or his angle. He was an excellent practical mechanic, and of most of the machines described in his work on mechanics he had made very good models. The spinning-wheel delineated in that work was the one on which his wife employed her leisure hours. He had also a very profound knowledge of the musical scales, both ancient and modern, although he was but a poor performer; still he was dexterous in the repair of musical instruments, and was generally employed to tune the harpsichords and clean the clocks throughout the district in which he resided.

The bold and frank manner in which Emerson spoke on all subjects has led some persons to affirm that he was a sceptic in religion. Of this however there is not the slightest evidence; but it appears to have arisen from the insinuations of his scientific opponents, who thus attempted to crush his reputation with the world, and thereby weaken his authority in matters connected with science—a course too often adopted in our own day by those who contend for victory rather than truth. Emerson was through a long life universally accounted a man of integrity; but his honesty often led to dogmatism, and his indignation at error to an expression of feeling that gave his controversial writings an air of ungracious severity.

A considerable number of Emerson's processes are marked with peculiar elegance and considerable powers of invention; still there is apparent in all of them a want of that power of generalisation which distinguishes the highest order of minds. His 'Method of Increments' is the most original of his works; and his 'Doctrine of Fluxions' is perhaps the most elegant. His 'Mechanics' is the work by which he is most generally known, a circumstance probably owing to its containing descriptions of so many of the more usual and useful machines; but it is a work singularly crude and ill-digested, and not less singularly incomplete in even the enunciation of the most important principles of mechanical science.

The following is a list of his works, all in 8vo, except his 'Mechanics and Increments' in 4to, and his 'Navigation' in 12mo:—1, 'Doctrine of Fluxions'; 2, 'Projection of the Sphere, Orthographic, Stereographic, and Gnomonic'; 3, 'The Elements of Trigonometry'; 4, 'Principles of Mechanics'; 5, 'A Treatise on Navigation'; 6, 'A Treatise on Arithmetic'; 7, 'A Treatise on Geometry'; 8, 'A Treatise on Algebra'; 9, 'The Method of Increments'; 10, 'Arithmetic of Infinities, and the Conic Sections, with other curve lines'; 11, 'Elements of Optics and Perspective'; 12, 'Astronomy'; 13, 'Mechanics, with Centripetal and Centrifugal Forces'; 14, 'Mathematical Principles of Geography, Navigation, and Dialling'; 15, 'Commentary on the Principia, with a Defence of Newton'; 16, 'Miscellanies.'

EMMIUS UBBO, was born at Gretha, in East Friesland, in 1547. His father was a clergyman of the Lutheran communion. Emmius studied at Bremen, Rostock, and lastly at Geneva, where he became intimate with Beza. He afterwards returned to his native country, and in 1589 was made rector of the school of Norden, in East Friesland. In 1594 he was appointed to the chair of history and the Greek language in the college of Groningen, and when the university of Groningen was instituted in 1614, Emmius was made rector of the same. He was deeply imbued with classical learning, and he excelled in the knowledge of history, ancient and modern. Among his historical works the most important is the 'Vetus Græcia illustrata,' 3 vols. Leyden, 1626. The first volume consists of a description of ancient Greece, including the islands; the second contains a history of that country; and the third, which is the most elaborate and interesting, gives an account of the political institutions and social manners of the various Greek states, namely, of Athens, Sparta, Crete, Argos, Thebes, Corinth, Syracuse, Corcyra, Samos, Chios, Rhodes, Achaia, Ætolia, Massilia in Gaul, Locri in Italy, and Lycia in Asia. The author has also introduced a brief sketch of the Carthaginian republic. The appendix contains an account of the decline and fall of three of the above states—Athens, Carthage, and Sparta. Emmius gives a long list of ancient authors from whom he derived his information. The work is altogether useful, and was still more so at the time of its appearance, when good works on classical learning were more scarce than they are at present. The other works of Emmius are—2, 'Opus Chronologicum,' or a General Chronology, folio, 1619. 3, 'Rerum Frisicarum Historia, à gentis origine usque ad ann. 1565,' Leyden, 1632: it is a good history of Friesland, the author's native

country, to which is added 'De Frisiorum Republica Commentarius,' published before separately at Emden in 1619. 4, 'De Agro Frisiae inter Amasum et Laticum flumina,' 5, 'Historia nostri Temporis,' Groningen, 1732. Emmius Ubbo died in 1625, in his seventy-eighth year. At the time of his death he was busy writing a history of Philip of Macedonia, the father of Alexander the Great, which he intended as a warning to the republic of the United Provinces against the designs and intrigues of their enemies. He had written as far as the fifteenth year of Philip's reign. Emmius was acquainted with, and appreciated by, most of the learned men of his time, such as De Thou, Gruter, Gomar the theologian, Pezelius, and others. He was especially a favourite with William Louis, of Nassau, the governor of Friesland and Groningen.

EMPEDOCLES, a native of Agrigentum in Sicily, who flourished about B.C. 450: he was distinguished not only as a philosopher, but also for his knowledge of natural history and medicine, and as a poet and statesman. It is generally believed that he perished in the crater of Mount Ætna. The story that he threw himself into it in order that by disappearing suddenly and without a trace, he might establish his claim to divinity, and the charge of arrogance founded upon that pretension, seems to have rested on a misconception of his doctrine that the human soul (and consequently his own) is divine and immortal.

His masters in philosophy are variously given. By some, like the Eleatics generally, he is called a Pythagorean, in consequence of a resemblance of doctrine in a few unessential points. But the principles of his theory evidently show that he belongs to the Eleatic school, though the statement which makes him a disciple of Parmenides rests apparently upon no other foundation than a comparison of their systems; as, in like manner, the common employment of the mechanical physiology has led to an opinion that he was a hearer of his contemporary Anaxagoras.

He taught that originally All was one:—God, eternal and at rest: a sphere and a mixture (*σφαῖρος, μίγμα*)—without a vacuum—in which the elements of things were held together in undistinguishable confusion by love (*φιλία*)—the primal force which unites like to unlike. In a portion of this whole however, or, as he expresses it, in the members of the Deity, strife (*νεῖκος*)—the force which binds like to like—prevailed and gave to the elements a tendency to separate themselves, whereby they first became perceptible as such, although the separation was not so complete, but that each contained portions of the others. Hence arose the multiplicity of things: by the vivifying counteraction of love organic life was produced, not however so perfect and so full of design as it now appears; but at first single limbs, then irregular combinations, till ultimately they received their present adjustments and perfection. But as the forces of love and hate are constantly acting upon each other for production or destruction, the present condition of things cannot persist for ever, and the world which, properly, is not the All, but only the ordered part of it, will again be reduced to a chaotic unity, out of which a new system will be formed, and so on for ever.

There is no real destruction of anything, only a change of combinations. It must be remarked that the primal forces, love and hate, must not be supposed to be extrinsically impressed upon matter; on the contrary, while strife is inherent in the elements separately, love is in the mass of things—nay, more, is one with it—God. Of the elements (which he seems to have been the first to exhibit as four distinct species of matter), fire, as the rarest and most powerful, he held to be the chief, and consequently the soul of all sentient and intellectual beings which issue from the central fire, or soul of the world. The soul migrates through animal and vegetable bodies in atonement for some guilt committed in its unembodied state when it is a demon; of which he supposed that an infinite number existed. The seat of the demon when in a human body is the blood.

Closely connected with his view of the objects of knowledge was his theory of human knowledge. In the impure separation of the elements it is only the predominant one that the senses can apprehend, and consequently, although man can know all the elements of the whole singly, he is unable to see them in their perfect unity wherein consists their truth. Empedocles therefore rejects the testimony of the senses, and maintains that pure intellect alone can arrive at a knowledge of the truth. This is the attribute of the Deity, for man cannot overlook the work of love in all its extent; and the true unity is only open to itself. Hence he was led to distinguish between the world, as presented to our senses (*κόσμος αἰσθητός*), and its type the intellectual world (*κόσμος νοητός*).

His explanation of the cognitive faculty, which rested upon the assumption that "like can only be known by like," is drawn naturally enough from his physical view. Man is capable of knowing outward things, since he is, like them, composed of the four elements, and of the two forces love and hate; and it is especially by the presence of love within him that he is able to arrive at an intellectual knowledge of the whole, however imperfect and inferior to the divine.

(The Fragments of Empedocles were published with a commentary by Fr. W. Sturz, Leipzig, 1805, 8vo; see also Empedoclis and Parmenidis *Fragmenta, ex Cod. Taur. Bibl. restituta et illustrata*, ab A. Peyron, Lips. 1810, 8vo; Karsten, *Empedoclis Agrigentini Carmin. Reliq.*, in vol. ii. of *Philosophorum Græcorum veterum reliquie*, Amst., 1838; and Zeller, *die Philosophie der Griech.*, Tübingen, 1844.

* ENCKE, JOHANN FRANZ, director of the Royal Observatory at Berlin, was born at Hamburg on September 23, 1791. His father was a clergyman, and after being prepared at home he was sent to the University of Göttingen, where he studied under Professor Gauss. On leaving the university he entered the Prussian military service, and was acting as lieutenant of artillery in the fortress of Kolberg, when he became acquainted with the Saxon minister of state Lindenau, who gave him a situation in the observatory of Seeburg, near Gotha. He remained here till 1825, when he was appointed Director of the Royal Observatory at Berlin, which situation he has ever since occupied. In the same year he was elected a foreign member of the Royal Society of London, and somewhat later he was chosen secretary of the mathematical section of the Academy of Sciences at Berlin, and he was created a knight by Frederick William IV. in 1840. His first work was his collected observations on the transit of Venus, in his work on 'Die Entfernung der Sonne,' published at Gotha in two volumes in 1824-26. But his greatest work was two treatises 'On the Comet of Pons,' which appeared at Berlin in 1831-32. Encke had been engaged since its appearance in 1818 in endeavouring to discover the elements of its orbit. He had been enabled, from the shortness of its revolution, to identify it with the comet described by Mechain and Messier in 1786, in the constellation Aquarius; with that discovered in 1795 in the constellation Cygnus, by Miss Herschel; and with the comet observed by Pons in 1805, and which had hitherto been considered as separate bodies. His investigations had enabled him to predict its return in 1822, adding the probability that it would not be seen in Europe. His prediction was verified: the comet appeared, and was seen by M. Rumker in New South Wales on June 3, 1822. This gentleman's observations enabled Encke to reconstruct his calculations for its orbit more definitely, and to compute its return with greater confidence in 1825. Its reappearance occurred as foretold, and the fresh materials then acquired gave him the means of more certainly fixing its return for 1828, when it was first observed by Mr. Smith on October 30. It has thence received the name of Encke's comet. Its appearance in 1828 afforded him an opportunity of fixing its orbit, which is within that of Jupiter, and its period of recurrence is about three years and three-tenths, or more exactly, as determined on its reappearance in 1832, in 3.29 years. From some of the phenomena connected with it, Encke drew the conclusion that the heavens oppose a resisting medium to the motion of bodies, an idea to which he has drawn attention in his treatises. From 1830 he has issued yearly the 'Astronomische Jahrbücher,' a well-known and valuable series, and 'Astronomical Observations made at the Royal Observatory at Berlin,' of which the first volume appeared in 1840. He also in 1845 published dissertations 'De Formulæ Dioptricæ,' and in 1846 another 'On the Relation of Astronomy to the other Sciences.' Encke's first two treatises, originally published in the 'Astronomische Nachrichten,' were translated by Professor Airy in 1832 under the title of 'Encke's Dissertation,' and contained a full account of Encke's comet, with a discussion of the question, suggested by Encke's resolution of its orbit, and his hypothesis of a resisting medium, as to the gradual approach of this comet to the sun.

ENFIELD, WILLIAM, was born at Sudbury, in Suffolk, on March 29, 1741, of humble but respectable parents. The disadvantages of his early education were made amends for, in a great degree, by a fondness for reading and incessant labour towards improving his mind. This disposition to literary application introduced him to the notice of Mr. Hextall, the dissenting minister of the place, who kindly and judiciously directed him in his studies, and by his encouragement and advice led him to devote himself to the Christian ministry. In his seventeenth year he was admitted to the Academy or Dissenting College at Daventry, then conducted by the Rev. Dr. Ashworth. Here he passed through the usual course of study of five years, and was distinguished for his habitual diligence and for an unusual facility and elegance of composition. It was here also that he, with some others of his fellow-students, formed the design of making Christian morality, rather than points of faith, the object of their discourses. Immediately on leaving the academy he was invited to the office of minister to the congregation of Benn's Garden, in Liverpool. In 1767 he married Mary, the only daughter of Mr. Holland, draper in Liverpool—a connection which constituted his principal happiness for the rest of his life. In 1768 and 1770 he published two volumes of sermons, which were very favourably received. One of these volumes, now scarce, is rather remarkable for being embellished with vignette sketches illustrative of the subject of each discourse, from the pencil of Fuseli. He took his leave of Liverpool on being invited to the office of tutor in the belles-lettres and resident conductor of the discipline at the academy of Warrington. These offices he accepted in conjunction with that of minister to the dissenting congregation of Warrington. The degree of Doctor of Laws was obtained from Edinburgh for him by the trustees of the academy.

Of Dr. Enfield's industry some idea may be formed from the following list of the works which he published during his residence at Warrington; and in the midst of his other various and important occupations:—'The Preacher's Directory,' 4to, 1771; 'The English Preacher, a Collection of Sermons abridged and selected from various Authors,' 9 vols. 12mo, 1773; 'An Essay towards the History of Liverpool, principally from the Papers of Mr. George Perry,' fol., 1774;

'Observations on Literary Property,' 4to, 1774; 'The Speaker, or Miscellaneous Pieces selected from the best English Writers, for the purposes of Reading and Speaking,' 8vo, 1774; 'Biographical Sermons on the Principal Characters of the Old and New Testament,' 12mo, 1777; 'Exercises in Elocution, being a Sequel to the Speaker,' 8vo, 1781; 'A Translation of Rosignoli's Elements of Geometry,' 8vo; 'Institutes of Natural Philosophy, Theoretical and Experimental,' 4to, 1783. He published also various occasional sermons. None of these, however useful in their day, are of much value now. The 'Speaker,' it should however be noted, was one of the first selections from our English classical writers. Dr. Enfield published also while at Warrington another small volume of sermons on the principal characters of the Old and New Testament, and Dr. Aikin says that while there he drew up a series of discourses on the principal incidents and moral precepts of the gospel. This work was not published, but a selection of twenty sermons from it forms the last of three volumes of discourses which were published after his decease by subscription for the benefit of his widow. The series of discourses on the gospels was written chiefly, if not altogether, at Norwich.

After the dissolution of the academy, Dr. Enfield remained two years at Warrington, occupied in the education of private pupils and in his duties as minister of the congregation. In 1785 he accepted an invitation from the Octagon dissenting (Unitarian) congregation at Norwich. He first settled at the village of Thorpe, where he received private pupils, and afterwards removed to Norwich, where at length he devoted his whole time to literary occupations and his official duties. It was during his residence at Norwich that, besides being engaged as a writer in the 'Monthly' and 'Analytical' reviews, he undertook an abridgment of Brucker's 'History of Philosophy,' in 2 vols. 4to. In this task he was kindly encouraged by Dr. Bagot, at that time bishop of Norwich, who accommodated him with books from Cambridge and from his own library.

Dr. Enfield was also a frequent contributor to the 'Monthly Magazine' at its commencement, in which the papers under the title of the 'Enquirer' are mostly from his pen. His last literary undertaking was that of a 'General Biographical Dictionary,' in conjunction with one of his oldest and most valued friends, Dr. John Aikin. He resided at Norwich till his death, which, after a short but painful illness, took place on November 3, 1797.

As a sermon-writer, Dr. Enfield obtained so great a reputation as not only to be applied to for assistance by his less industrious dissenting brethren, but also, through the agency of a London bookseller, by several of the clergy of the Establishment, for sermons on particular occasions, for which he was liberally remunerated. As a preacher, his manner of delivery was grave and impressive, affecting rather a uniform dignity than a variety of expression. As a companion, he was universally esteemed in every situation, and at every period of his life.

ENGHIEN, LOUIS-ANTOINE-HENRI-DE-BOURBON, DUC D', was born at Chantilly in August 1772. He was the son of the Duke of Bourbon and grandson of the Prince of Condé, being a lateral branch of the then reigning family of France. After the French revolution broke out, young d'Enghien served under his grandfather in the corps of the French emigrants who fought on the Rhine. At the peace of Lunéville in Austria in 1801 the corps was disbanded, and d'Enghien fixed his residence at Ettenheim, a château on the German side of the Rhine, a few miles from that river, and in the territories of the margrave of Baden. An attachment between him and the Princess Charlotte of Rohan, who resided at Ettenheim with her relative the Cardinal de Rohan, induced the duke to remain there. After the war had broken out again between England and France, in 1803, the English government took the French emigrants again into its pay, and they were directed to go to the German side of the Rhine to act when required. The Duke of Enghien was looked upon as their head. Meantime the conspiracy of Georges and Pichegru against the person of the first consul, Bonaparte, was discovered at Paris. It has never been proved that the Duke of Enghien was privy to that conspiracy, but it appears that he was led to expect an insurrectionary movement in France in favour of the Bourbons, of which he intended to avail himself by entering France at the head of the emigrants. Bonaparte, alarmed at the conspiracy and at the avowed intention of Georges to assassinate him, seems to have persuaded himself that the Duke of Enghien was connected with the Paris conspirators, and that the whole was a plan directed by the Bourbons in England and by the English government; and he determined upon getting rid of his enemies by summary means. He accordingly despatched a party of gendarmes, who crossed the Rhine, entered without ceremony the neutral territory of Baden, surrounded the château of Ettenheim, and took the Duke of Enghien prisoner, the 15th of March 1804. [For the following part of the transaction, see BONAPARTE, NAPOLEON I., vol. I., col. 783.] The duke underwent the mockery of a trial before a secret court, which evidently acted merely as the instrument of the first consul; and its sentence was carried into execution with a most indecent haste. The duke was found guilty of all the charges preferred against him, some of which were never proved. Even the recommendation of the court for a respite to the prisoner was overruled by Savary, who was present at the sitting as a sort of extra-judicial authority to watch over the proceedings.

It was one of the worst instances on record of a judicial murder, and has stamped an ineffaceable stain on the fame of Napoleon, who at the time openly avowed to the Council of State his firm purpose of making an example of the duke in order to deter the other Bourbon princes and their partisans from plotting against him in future. And again, at St. Helena, almost at his dying hour, he took upon himself alone the whole responsibility of that deed. ('Testament de Napoléon.') After the Restoration, Hullin, president of the court, Savary, Caulincourt, and others who had a share in the arrest, trial, and execution of the duke, wrote each in justification or extenuation of their respective conduct. The fate of the Duke of Enghien excited interest and commiseration throughout Europe; he was young, brave, amiable, and one of the most promising of the Bourbon princes.

ENNIUS, QUINTUS, the old epic poet of Rome, was born at Rudia, now Ruvo, in Calabria, in the year B.C. 239, two years after the termination of the first Punic war. He was a Greek by birth, and is one among many instances how much Roman literature was indebted even directly to foreign talent. History does not inform us what his original Greek name was, for that of Ennius is evidently of Latin form, and was probably adopted by him when he was admitted to the privileges of a Roman citizen. Of his early life little is positively known. He entered the military service of the Romans, and in the year 204 was serving as a centurion in the island of Sardinia, where his abilities attracted the notice of Cato, who was then acting as quaestor under the first Scipio Africanus. When Cato left the island, the poet accompanied him to Rome, and fixed his residence on the Aventine Hill. The introduction of Cato, his military character, and his poetical abilities, won for him the friendship and intimacy of the first men of Rome, and he was largely instrumental in introducing letters among a nobility who had hitherto gloried as much in their ignorance as their courage. Cato himself learned Greek from him. Scipio Africanus found in him a companion in peace and the herald of his glories in war. Scipio Nasica, the son of Africanus, delighted in his society; and M. Fulvius Nobilior, the consul, A.C. 189, himself possessing a high literary character, prevailed on the soldier-poet to accompany him in the war against the Ætoliæ. It was to the son of this Fulvius that he was indebted for his admission to the citizenship of Rome. His great social qualities unfortunately led him into intemperance, for which he paid the penalty in severe sufferings from gout. Still a hardy constitution enabled him to complete his seventieth year, and to the very last to devote himself to his favourite muses. He died in the year B.C. 169, and was buried in the Cornelian sepulchre, one mile out of Rome, on the Appian road, where his statue still appeared with those of Publius and Lucius Scipio, even in the age of Livy, a lasting monument of his intimacy with those great men. He lived, as we have already said, in the splendid dawn of Roman literature. Nævius, the first poet of Rome, and Livius Andronicus, were his predecessors by not many years. The tragic poet Pacuvius was his sister's son. Plautus was his contemporary, and the comic writer Cæcilius his companion in arms. The writings of Ennius were numerous and various. His great work called, somewhat unpoetically, by the name of 'Annals,' was an historical epic in eighteen books, written in hexameter verse, a form of metre which he is said to have been the first to introduce into Roman literature. This work traced the history of Rome from the mythical age of Æneas down to his own time. His labours in tragedy were extensive. He gave the Romans a translation, but evidently a very free one, of the 'Eumenides' of Æschylus, the 'Medea,' 'Iphigenia in Aulis,' and 'Hecuba' of Euripides, the 'Ajax' of Sophocles, besides as many as nineteen from other Greek poets. He also wrote comedies. His other works were 'Phædrica,' a poem on gastronomy, especially on the merits of fishes; an epic, or panegyric, entitled 'Scipio,' a metrical translation from a philosophic work of Epicharmus, partly in dactylic hexameters, partly in trochaic tetrameters; poems entitled 'Asotus,' 'Sotadicus,' 'Protreptics,' and 'Præcepta'; also satires, epigrams, and acrostics; and a prose translation of the sacred history of Eumerus. Of all these works there is only an unconnected mass of fragments collected from quotations in Cicero and other writers. The work entitled 'Annals' was for a long time the national epic of Roman literature, and Virgil has not scrupled to borrow freely from it. The best edition of Ennius is that by Henselius, 4to, Amsterdam, 1707.

EON DE BEAUMONT, CHARLES-GENEVIEVE-LOUIS-AUGUSTE-ANDRÉ-TIMOTÉ D', generally known as the Chevalier D'Eon, owes his celebrity chiefly to the doubts long entertained of his sex. He was born of a respectable family at Tonnerre in Burgundy, October 17, 1727, received a good education, was called to the bar of the parliament in Paris as an advocate, and obtained some reputation by his literary productions. In 1755 he was introduced to Louis XV., and employed in diplomatic missions to Russia and to Austria; and in 1759 he served in the French army in Germany as a captain of dragoons and aid-de-camp to Marshal Broglie. In 1761 he came to England as secretary of embassy. Dissatisfied at being superseded in the post of minister plenipotentiary, which he had held for a short interval, he published 'Lettres, Mémoires, et Négociations particulières de Chevalier D'Eon,' exposing the secrets of his own court, and libelling both foes and friends. For one of these on the Count de Guercy

he was prosecuted in the Court of King's Bench in 1764, and found guilty. In the meantime he pretended to be in dread of being kidnapped by agents of the French government, and applied to Lord Mansfield for information as to whether he might not resist, and repel force by force; and in 1764 presented a bill of indictment against De Guercy for a conspiracy against his life. He however disappeared just before being called up to receive judgment for the libel, and on the 13th of June 1765 he was outlawed. He probably retired to France.

Notwithstanding his intemperate and discreditable conduct in publishing the private papers of the embassy, he received the continued confidence of Louis XV., who, in 1766, settled a pension on him for his services in Russia. In 1769 he returned to England. In 1777 an action was brought in the King's Bench before Lord Mansfield, to recover a wager laid as to the sex of Chevalier D'Eon, when the plaintiff produced witnesses, one of whom, a surgeon, swore to his being a female; and the plaintiff got a verdict for 700*l*. It was understood that many other sums, to a large amount, depended on this suit, but they were not paid, an act of parliament having been passed to restrain such gambling speculations. The chevalier now returned to France, wearing the dress of a woman; and coming back to England gave lessons in fencing in his female garb. Matched against professors such as St. George and M. Angelo, he showed himself a master of his art. This occupation he pursued for some years; but in 1791 he advertised a sale of his effects, the catalogue of which enumerated books, prints, medals, fire-arms, sabres, military uniforms, petticoats, gowns, silks, jewels—articles alike suited for a cavalry officer or a fashionable lady. He was resolved, he says, "to take nothing away but his honour." Again in France, the National Assembly being sitting, he petitioned on May 11, 1792, as Madame D'Eon, to serve in the army. She stated that, though she had worn the dress of a woman for fifteen years, she was desirous of exchanging her cap and petticoats for her old helmet and her sabre. The petition was received with bursts of applause, and was ordered to be honourably mentioned in the minutes; but as no other result followed, the chevalier once more returned to England, where, in poverty and ill-health, he lingered for a few years, and died on May 21, 1811. After his death his body was examined, and dissected by Mr. J. Copeland, an eminent surgeon, and no doubt was left as to the petticoat imposture.

EÖTVÖS, JOZSEF, one of the most conspicuous names of modern Hungary, both in the literary and the political world. His grandfather was a government officer of high rank in Hungary; his father, who also held high posts in the government, married a German lady, the Baroness Lilién. Eötvös was born at Buda, on the 3rd of September 1813. His education was entrusted to the care of a private tutor of the name of Prussinsky, who was of republican sentiments, and had been concerned in the conspiracy of Martinovics, which had been punished with great severity by the government of Vienna towards the close of the last century. The boy was sent to a public school just at the period when his grandfather had rendered himself obnoxious by taking part in the proceedings commenced by the Austrian court in 1823 to raise taxes and recruits in Hungary without the consent of the Hungarian Diet, and he was at once told by his schoolfellows that his grandfather was a traitor, and that he too was a traitor, for he was almost thirteen and could hardly speak Hungarian. Stung by these reproaches, and full of the republican sentiments of his tutor, the boy made a speech to his schoolfellows to the effect that he would atone for the crimes of his father, and be "liberty's servant and his country's slave." From that day dates his mastery of the Hungarian language, of which he is perhaps the first living writer. In the year 1826 the Austrian government, met by the steady constitutional opposition of the Hungarian counties, was obliged to give way, and a quieter period succeeded, which was speedily marked by the rapid progress of Hungary in the path of material and mental improvement, in which Count Széchenyi led the van. Eötvös, who in 1830 had already commenced his literary career by a translation of Goethe's 'Goetz von Berlichingen,' followed it up before 1833 by two original comedies, 'The Critics' and 'The Weddings,' and a tragedy, 'Bossa,' or 'Revenge,' which were considered of high promise, and showed a singular beauty of style. In 1836 he travelled in Germany, Switzerland, France, and England, when he probably formed the high opinion of our country which he has expressed in his funeral oration on Csoma de Körös. [CSOMA.] Soon after his return to Hungary, the calamitous inundations at Pesth led, among other projects, to the publication of a work made up of contributions from the pens of the first Hungarian authors, the profits of which were to be given to the relief of the sufferers. Of this work, the 'Budapesti Árviakönyv,' which extended to 5 vols., and was published between 1838 and 1841, Eötvös was the editor, and he also contributed the longest article, a novel, entitled 'The Carthusian,' which at once revealed a writer of remarkable powers. The views of life contained in it, which are of the Byronic school, led to severe censure on the part of some of the Hungarian critics, who could not however contest that the style placed its author on a level with Kölcsey, who had hitherto been without a rival in the literature of the day. The young novelist soon made himself conspicuous in a new career as a parliamentary orator. His views of political matters differed not only from those of the conservative party, but from those of the rival leaders, Széchenyi and

Kossuth, though most nearly allied to those of the latter. While Kossuth was at that time disposed to rely on the old machinery of the Hungarian institutions, objectionable as much of it was, as the best means of counteracting the despotic tendencies of the Austrian court, Eötvös advocated a bolder course, and was for extensive reforms, in accordance with the spirit of the age, to be carried out by a vigorous centralised government, unchecked by the prejudices of local authorities, to which he thought too much power of obstruction was already conceded. Though the Eötvös party was far from equal, either in numbers or influence, to the others, it had considerable effect on the progress of affairs. A pamphlet by its leader on prison discipline, in which he opposed the American system, which had been advocated by Farkas, the American traveller, produced a strong impression; and a committee of the diet was appointed to consider the subject, in which he had a seat. Count Louis Batthyani and Eötvös were at this time the leaders of the opposition in the upper house of the Hungarian Diet, and Eötvös was its ablest speaker, occupying, from his rank, his fine person, and his splendid talents, one of the very first positions in Hungarian society.

At this time from some unfortunate financial speculations of his father, which were shipwrecked by the monetary crisis of 1841, the family fortune was irretrievably ruined. Eötvös was reduced to comparative poverty, and though a career of power and wealth would undoubtedly have been open to him if he had chosen to accept them from the Austrian court, with the sacrifice of some portion of his principles, he at once, without wavering, trusted his fortunes to the scantily remunerated labours of the pen. To demonstrate the vices of the old Hungarian system of government by county elections, he commenced a tale, intended at first to be little more than a political pamphlet in action, on the plan of Miss Martineau's 'Illustrations of Political Economy.' It was published in numbers, and, as in the case of the 'Pickwick Club,' it grew both on the author and the public as it went on till at last it turned out something very superior to what either had expected. 'A Falu Jegyzője,' or 'The Village Notary,' is one of the best national tales in the whole circle of European literature. In the second volume in particular the liveliness and vigour of the narrative, the easy and natural manner in which incident after incident keeps turning up, some of a humorous, some of a political character, and both treated with an equal mastery, present a combination of excellence which will not easily be matched, except in the masterpieces of Walter Scott. Strange to say, the Hungarian critics were some of the last to discover an excellence which soon carried the work into circles which no Hungarian novel had ever visited before. The English translation by Otto Wenckstern, published in 1850, with a preface by Pulszky, the author's former friend, to whom the original was dedicated, is executed with remarkable freedom and vigour, but is less close to the Hungarian than the German one by Mailath, which is an exact reproduction of the original. The 'Notary,' which was published in 1845, was followed in 1847 by a third romance 'Magyarország 1514-ben,' or 'Hungary in 1514,' which is a delineation of the peasants' revolt, crushed at that time with singular cruelty by the nobles. The scene is laid on the banks of the Temeş in the very localities which a few years later were destined to be the theatre of the momentous struggle which has terminated in the temporary loss of Hungarian independence. Eötvös's political labours were continued with as much vigour as his literary ones. For some time he wrote the leading articles in the 'Pesti Hírlap,' one of the leading newspapers of Hungary, and these were collected and published in a volume under the title of 'Reform.' His opponents were of course not slow to avail themselves of the old reproaches which have been directed against the combination of politics and literature, and perhaps the authorities which he cites in his defence in one of his articles will hardly be regarded as conclusive. "Richelieu," he says, "occupied himself with writing tragedies, Frederick the Great considered himself a poet, Canning is not regarded as an altogether brainless statesman, though he is the author of some fine verses, and the whole of the last Whig ministry, which consisted almost exclusively of poets, did not govern England so badly after all—so long as it had a majority." The time was now approaching in which the whole existence of Hungary was to be shaken to its foundations. Eötvös, when after the revolution of February 1848, he went to attend the diet of Pressburg, told his friends, "I shall return a minister of state." He was correct in his prediction. He was offered and accepted the post of minister of public instruction in the Batthyani administration. He brought forward a large plan for the improvement of education, which was strongly opposed by different religious parties on the same ground on which similar plans have been opposed in England, the Catholics protesting that Eötvös showed too much favour to the Protestants, and the Protestants to the Catholics. At length Kossuth by threatening to resign if the measure was rejected, carried it through the diet. But the headlong course of events which followed had much that was so alien to the feelings and opinions of Eötvös that he became every day more averse to his position, and finally the outbreak on the bridge at Peath in which Count Lamberg, appointed by the emperor of Austria governor of Hungary, was torn to pieces by the populace, determined him to withdraw. He left the country and went first to his family at Vienna, then to Munich, and during the momentous crisis that succeeded remained quietly in Bavaria. "To

those who know me and my way of thinking," he wrote to a friend, "it is easy to explain why I retired, to others it is impossible." "Amid these contests," he said on another occasion, "I feel myself useless; Heaven did not make me for a man of revolutions." His friend Pulszky informs us in the preface to the English translation of the 'Village Notary,' that Eötvös was often in the habit of relating to his friends that, when at Paris in 1837, he had visited Madame Le Normant, the famous fortune-teller, and that she had told him, "You are rich; you will be poor; you will marry a rich wife; you will be a minister of state, and you will die on the scaffold." The other portions of the prediction had been accomplished, and Batthyani, the head of the ministry of which Eötvös was a member, did die on the scaffold, a victim of the Austrian government.

From Bavaria Eötvös issued a German pamphlet 'On the Giving of Equal Rights to Different Nationalities,' in which he aimed at showing that to do so was destructive of the unity and vigour of a state. He has since returned to Hungary, and has published a large political treatise 'On the Influence of the Leading Ideas of the Nineteenth Century on the State,' both in Hungarian and German, the German translation made by himself. The first volume of this work was issued in 1851, and the second in 1854. It has been remarked, and apparently with truth, that, although the ideas with which he commenced his political career were revolutionary in the extreme, Eötvös, the poet and novelist, has long been remarkable among Hungarian politicians for the sobriety and moderation of his views, which have lost him the favour of both of the extreme parties in his native country. The remark with which he commences his last work is one quite opposed to ordinary notions, yet one that is not unlikely to be ratified by posterity:—"Although it is usual to accuse the age in which we are living of the grossest materialism, a calm consideration of what is going on around us must convince any one that scarcely a century is to be found in history in which whole nations have more readily offered up all considerations of their material welfare to the realisation of ideas."

EPAMINONDAS, a Theban statesman and soldier, in whose praise, both for talents and virtue, there is a remarkable concurrence of ancient writers. Nepos observes that, before Epaminondas was born, and after his death, Thebes was always in subjection to some other power: on the contrary, while he directed her councils, she was the head of Greece. His public life extends from the restoration of democracy by Pelopidas and the other exiles, B.C. 379, to the battle of Mantinea, B.C. 362. In the conspiracy by which that revolution was effected he took no part, refusing to stain his hands with the blood of his countrymen; but thenceforward he became the prime mover of the Theban state. His policy was first directed to assert the right and to secure the power to Thebes of controlling the other cities of Boeotia, several of which claimed to be independent. In this cause he ventured to engage his country, single-handed, in war with the Spartans, who marched into Boeotia, B.C. 371, with a force superior to any which could be brought against them. The Theban generals were divided in opinion whether a battle should be risked—for to encounter the Lacedæmonians with inferior numbers was universally esteemed hopeless. Epaminondas prevailed with his colleagues to venture it, and devised on this occasion a new method of attack. Instead of joining battle along the whole line, he concentrated an overwhelming force on one point, directing the weaker part of his line to keep back. The Spartan right wing being broken, and the king slain, the rest of the army found it necessary to abandon the field. This memorable battle was fought at Leuctra. The moral effect of it was much more important than the mere loss inflicted on Sparta, for it overthrew the prescriptive superiority in arms claimed by that state ever since its reformation by Lycurgus.

This brilliant success led Epaminondas to the second object of his policy—the overthrow of the supremacy of Sparta, and the substitution of Thebes as the leader of Greece in the democratical interest. In this hope a Theban army, under his command, marched into Peloponnesus early in the winter, B.C. 369, and, in conjunction with the Eleians, Arcadians, and Argians, invaded and laid waste a large part of Laconia. Numbers of the Helots took that opportunity to shake off a most oppressive slavery; and Epaminondas struck a deadly blow at the power of Sparta, by establishing these descendants of the old Messenians [ARISTOMENES] on Mount Ithome, in Messenia, as an independent state, and inviting their countrymen, scattered through Sicily and Italy, to return to their ancient patrimony. Numbers, after the lapse of 200 years, obeyed the call. This memorable event is known in history as the return of the Messenians.

In B.C. 368 Epaminondas again led an army into Peloponnesus; but not fulfilling the expectations of the people, he was disgraced, and, according to Diodorus (xv. 71), was ordered to serve in the ranks. In that capacity he is said to have saved the army in Thezaly, when entangled in dangers which threatened it with destruction; being required by the general voice to assume the command. He is not again heard of in a public capacity till B.C. 366, when he was sent to support the democratic interest in Achaia, and by his moderation and judgment brought that whole confederation over to the Theban alliance without bloodshed or banishment.

As the narrowness of our limits forbids us to trace the motives which led to the formation of so powerful a Theban party in Pelopon-

ness, so we cannot enter into the causes of its decline, except by saying, that it soon became plain that a mere change of masters, Thebes instead of Sparta, would be of no service to the other states. Achaia first, then Elis, then Mantinea and great part of Arcadia, returned to the Lacedæmonian alliance. To check this defection Epaminondas led an army into Peloponnesus for the fourth time, B.C. 362. Joined by the Argians, Messenians, and part of the Arcadians, he entered Laconia, and endeavoured to take Sparta by surprise; but the vigilance of Agesilaus just frustrated this scheme. Epaminondas then marched against Mantinea, near which was fought the celebrated battle in which he fell. The disposition of his troops on this occasion was an improvement on that by which he had gained the battle of Leuctra, and would have had the same decisive success, but that in the critical moment, when the Lacedæmonian line was just broken, he received a mortal wound. The Theban army was paralysed by this misfortune; nothing was done to improve a victory which might have been made certain, and this battle, on which the expectation of all Greece waited, led to no important result. "Each party," says Xenophon, "claimed the victory and neither gained any advantage; indecision, trouble, and confusion, more than ever before that battle pervaded Greece."

Whether Epaminondas could much longer have upheld Thebes in the rank to which he had raised her, is very doubtful: without him she fell at once to her former obscurity. His character is certainly one of the fairest recorded in Greek history. His private life was moral and refined; his public conduct uninfluenced by personal ambition, or by personal hatred. He was a sincere lover of his country, and if, in his schemes for her advancement, he was indifferent to the injury done to other members of the Grecian family, this is a fault from which, perhaps, no Greek statesman, except Aristides, was free.

(Xenophon, *Hellen.*; Plutarch, *Pelopidas*, *Agis*, &c.)

EPÉE, CHARLES-MICHEL DE L. This distinguished friend and instructor of the deaf and dumb was born at Versailles, in November 1712. His father, a man of talent and probity, was the king's architect. Young l'Epée was educated for the church, a profession for which his mild, cheerful, and pious disposition peculiarly fitted him. There were difficulties at first in the way of his admission to the priesthood. He was required, according to the established practice of the diocese of Paris, to sign a formulary of faith; and this being opposed to his own opinions (which were Jansenist), he could not do so conscientiously. He was however admitted to the rank of deacon, but was told never to pretend to holy orders. He was then led to engage in the study of the law, but this profession did not suit the bias of his mind. At last he succeeded in obtaining holy orders, being ordained by the Bishop of Troyes, a nephew of Bossuet, and received from him a canonry in the cathedral of Troyes.

An accidental circumstance led him to devote himself to the instruction of the deaf and dumb. Business took him one day to a house where he found only two young women, who were busily engaged in needlework, but who paid no attention to his questions. The mother of the young women arriving shortly afterwards, explained to him with tears that they were deaf and dumb. An ecclesiastic named Vanin had commenced the education of these young persons by means of pictures; but death had removed him, and no other person had offered to instruct the mutes. "Believing," says M. de l'Epée, "that these two children would live and die in ignorance of their religion, if I did not attempt some means of instructing them, I was touched with compassion, and told the mother that she might send them daily to my house, and that I would do whatever I might find possible for them."

John Paul Bonet's book came in the way of M. de l'Epée; a person offered a copy of it to him, urging him to buy it, which he at first refused, not knowing the nature of the work, and alleging that he did not understand Spanish, and that the book was therefore of no use to him. Opening it casually, he found the copperplate engraving of Bonet's one-handed alphabet. The book was immediately bought, and De l'Epée learned Spanish to enable him to read it. De l'Epée was persevering and disinterested in his instruction of the deaf and dumb. He persevered until he converted opposition and contempt into approbation, eventually enlisting the public in favour of his teaching to a much greater extent than any of his predecessors in the work of instructing the deaf and dumb had done. De l'Epée employed the finger-alphabet only partially in his method, his dependence being placed chiefly on methodical signs and writing for the conveyance of ideas; but he failed to see that in teaching signs he was not teaching ideas. He professed to teach the meaning with the signs and words, but the end would have been accomplished more simply by using the words only. Yet, though the methods of the Abbé de l'Epée were incomplete and somewhat cumbrous, there can be no reasonable doubt that he employed them because they were the best with which he was acquainted, or of which he was able to obtain information; and he devoted his life and his means with entire single-mindedness to the promotion of the moral and intellectual elevation of the unfortunate class whose cause he had espoused. His income was about 400*l.*, of which he allowed about 100*l.* for his own expenses, and appropriated the remainder to the support and instruction of indigent mutes. "The rich," he said, "only come to my house by tolerance; it is not to them

that I devote myself—it is to the poor; but for them, I should never have undertaken the education of the deaf and dumb."

M. de l'Epée died December 23, 1789, aged seventy-seven. His memory received various honours: his funeral oration was pronounced by the Abbé Fauchet, the king's preacher. He ranks deservedly among those whose lives have been devoted to the amelioration of the condition of their fellow-men, and the fruits of whose labours do not die with them.

EPHORUS, a Greek historian, born at Cyme in Æolis, in the year B.C. 405. (Suidas.) He survived the passage of Alexander into Asia (B.C. 333), which he mentioned in his history. (Clem. Al., 'Strom.' i. p. 337 A.) He studied rhetoric under Isocrates, but with so little success that after he had returned from Athens his father Demophilus sent him back to the rhetorician for fresh instructions. (Plutarch, 'Vit. Isocratis,' p. 366, Wytténb.) Isocrates, perceiving his unfitness for public speaking, recommended him to turn his attention to historical composition (Seneca, 'de Tranquillit. Animi,' c. vi.); but his style was low and slovenly even in his histories (Dio., i. p. 479); and Plutarch remarks upon the silliness of the set speeches which he introduced. ('Polit. Præcon,' p. 803 B.) Polybius observes that, though in his account of naval matters he is sometimes happy, he always fails in describing battles by land, and was entirely ignorant of tactics. ('Excerpt. Vatican,' p. 391.) Ephorus wrote—1. 'A History of Greece,' in 30 books, beginning with the siege of Troy, and terminating with the siege of Perinthus (B.C. 340). Part of the 30th book was written by his son Demophilus. (Diod., xvi. 14.) 2. 'On Inventions,' in 2 books. 3. 'On Goods and Ills,' in 24 books. 4. 'On Remarkable Objects in Various Countries,' 15 books. 5. 'The Topography of Cyme.' 6. 'On Diction.' The fragments of these works have been collected by Meier Marx, Carlsruhe, 1815; and by C. & Th. Müller, in pp. 234-277 of 'Erag. Hist. Græc.,' Paris, 1841.

EPHRAËM, or EPHRAÏM (Ἐφραίμ), an ecclesiastical writer of the 4th century of our era, was probably born in the town of Nisibis, though some state that he was born at Edessa. The time at which he attained the height of his fame is about A.D. 370. In his early youth he entered the monastic life, and in seclusion he carried on his philosophical studies with zeal and success. But at a later period he seems to have become tired of solitary life, and feeling a strong desire to benefit others by the talent and knowledge which he possessed, he went to Edessa, whither the most distinguished Syrians came to receive his instruction. He soon became deacon of the church at Edessa, but declined accepting any higher ecclesiastical office, and when he was elected bishop and received intelligence of it he rushed forth into the market-place and acted in such a manner that the people thought he was out of his senses. He then absconded until another had been appointed to the office of bishop in his place. He now went to Casarea in Cappadocia, to see Basilus the Great, who formed the highest opinion of his learning and piety. Ephraem spent the greater part of his life in writing and preaching on devotional and moral subjects, and especially against the Arian heresy; but he was equally energetic whenever there was any occasion to show by his acts that he really was the benevolent man that he appeared to be. This was especially manifest at the time when Edessa was suffering from famine: he gave his assistance everywhere; he called upon the rich to help the poor, and he himself undertook the care of seeing that the poor received what was intended for them. He was looked up to with admiration and reverence by his contemporaries, who distinguished him by the honourable designation of 'the prophet of the Syrians.' He died about 378, having ordered in his will that no one should praise him, according to the common practice, in a funeral oration, that his body should not be wrapped up in costly robes, and that no monument should be erected on his tomb. An interesting life of Ephraem, though not free from marvellous stories, is contained in the 'Acta Sanctorum,' tom. i. Febr. 49, &c.; comp. Nyssenus, 'Opera,' tom. ii. c. 60; Sozomen, iii. 16; Hieronymus, 'De Scriptor,' c. 115; Photius, 'Biblioth. Cod.,' 196; and some other sources collected by G. Vossius, in the first volume of his edition of the works of Ephraem.

Ephraem was one of the most prolific writers of his time. He knew no other language than the Syriac, but was considered to surpass all his contemporaries in the elegance and power of his oratory. Nearly all his works were translated into Greek in his own lifetime, and their popularity was so great that in some churches they were publicly read after the Scriptures. The Greek Church down to this day regards him as a saint. According to Photius, he wrote upwards of a thousand orations, besides many hymns, poems, and treatises on a variety of theological, philosophical, and moral subjects, which are still highly esteemed by theologians. Nearly all his works are extant, either in Syriac or in Greek and Arabic translations. The first collection of them that was published, though it is not complete, and only in a Latin translation, is that of G. Vossius, in 3 vols. folio, Rome, 1586-97; reprinted at Cologne, 1603, and at Antwerp, 1619. The publication of this Latin translation created a strong desire to see all the works of Ephraem, if not in the original Syriac, at least in the Greek translations which were made in the author's lifetime. This arduous task was undertaken by Assemani, who intended to publish the Greek in three folio volumes, and the Syriac in three others. The first three volumes, edited by Assemani himself, appeared at Rome in

1782-46; and the last three, containing the Syriac, were edited by Father Benedetti and Stefano Assemani. The Prolegomena to this edition contain everything worth knowing respecting the life and writings of Ephraem.

(Cave, *Historia Literaria*, vol. i. p. 188, &c.; Fabricius, *Biblioth. Græc.*, vol. viii. p. 217, &c., ed. Harles.)

EPICHRMUS, the son of Helothales, was born in the island of Cos, and accompanied Cadmus, the son of Seythes, to Sicily about the year B.C. 485. He must have arrived at maturity by this time; for he was a pupil of Pythagoras (who died in B.C. 497), and, according to Aristotle ('*Post.*' iii. 5), lived long before Chionides and Magnes (who, if we may believe Suidas, began to exhibit in B.C. 487); so that there can be no truth in the statement of Diogenes, that Epicharmus was brought from Cos to Sicily when a child of three months old (viii. 78). He and his brother were physicians, and therefore perhaps belonged to the Cosan house of the Asclepiads. It appears that he resided some short time at Megara, and possibly removed to Syracuse when Gelo transported the inhabitants of Megara thither (B.C. 484). It was at Megara that Epicharmus probably got the idea of writing comedies; for the Megareans, as well in Greece as in Sicily, are always spoken of as the originators of that branch of the drama. Epicharmus is called by Theocritus ('*Epigram.*' xvii.) the inventor of comedy, and Plato says that he was the chief comedian, just as Homer was the chief tragedian. ('*Theætet.*' p. 152, E.) The latter remarks refer, we believe, to his having first furnished the comus, or band of revellers, who were the original chorus in comedy, with a systematic dialogue and a plot of an epic character. That the comedies of Epicharmus had a chorus, and that this chorus was the representative of the comus, as in the old Athenian comedy, appears probable from the fact that one of his dramas was called '*Vulcan.*' or the '*Comastæ.*' "The subjects of the plays of Epicharmus," says Muller ('*Dorians.*' iv. 7, § 2), "were mostly mythological, that is, parodies or travesties of mythology, nearly in the style of the satirical drama of Athens. Thus, in the comedy of '*Busiris.*' Hercules was represented in the most ludicrous light, as a voracious glutton; and he was again exhibited in the same character (with a mixture perhaps of satirical remarks on the luxury of the times), in '*The Marriage of Hebe.*' in which an astonishing number of dishes was mentioned. He also, like Aristophanes, handled political subjects and invented comic characters like the later Athenian poets; and indeed the extent of his subjects was very wide. The piece called '*The Plunderings.*' which described the devastation of Sicily in his time, had a political meaning; and this was perhaps also the case with '*The Islands.*' at least it was mentioned in this play that Hieron had prevented Anaxilas from destroying Locri. In his '*Persians.*' also there were allusions to the history of the times. Epicharmus also introduced and almost perfected characters which were very common in the drama of later times; and if the plot of '*The Menæchmi.*' of Plautus was, as the poet seems to state in the prologue, taken from a comedy of Epicharmus, it must be granted that the ingenious construction of plots was not beyond the powers of that poet." Epicharmus lived to the age of ninety (Diog., '*Laert.*' viii. 78), or ninety-seven (Lucian, *Macrob.*, xxv.). The titles of thirty-five of his comedies are given in Fabricius (ii. p. 300).

EPICETUS was born at Hierapolis, a city of Phrygia. The year of his birth is not known, nor are we able to make any very close approximation to it. He must have been born however before the end of the reign of the emperor Nero, A.D. 68, else he could not have been more than twenty-one when Domitian published that edict against philosophers, in the year 89, in consequence of which Epictetus retired from Rome. At the age of twenty-one, he was not likely to have attained sufficient notoriety to bring him within the operation of such an edict.

Epictetus was born most probably during the last eight years of Nero's reign. The names and condition of his parents are unknown; neither do we know how he came to be brought to Rome. But at Rome he was for some time slave to Epaphroditus, who was a freedman of Nero's, and one of his body-guard. An anecdote related by Origen, which illustrates the fortitude of Epictetus, would also show, if it is true, that Epaphroditus was a most cruel master. "Epictetus, when his master was twisting his leg one day, smiled and quietly said, 'you will break it;' and when he did break it, only observed, 'Did I not tell you that you would do so?'" (Origen, '*C. Celæ.*' vii. p. 368.) We are not told how or when Epictetus managed to effect his freedom; but he could not have been still a slave when he left Rome in consequence of the edict against philosophers. This, which is the only event in his life whose date we can assign, took place, as has been said, in the year 89, being the eighth year of Domitian's reign. Epictetus then retired to Nicopolis, in Epirus; and it is a question whether he ever returned to Rome. The chief ground for believing that he did is a statement of Spartian ('*Vit. Hadr.*' 16), that Epictetus lived on terms of intimacy with the emperor Hadrian; while it is argued on the other hand, that there is no evidence of any of his discourses having been delivered at Rome, but that they contain frequent mention of Nicopolis. This argument is however hardly sufficient to overthrow the express testimony of Spartian.

We do not know when he died. Suidas says that he lived till the reign of Marcus Aurelius; and a confirmation of this statement has

been thought to be furnished by Themistius, who says ('*Orat. V.* ad Jovian. Imp.') that the two Antonines patronised Epictetus. But if, as there is good reason to believe, Epictetus was born before 68, the adoption of Suidas's statement would make him almost a hundred years old at his death; and what is said by Themistius might very well be true, even though Epictetus did not live under either of the Antonines. It may be added, that Suidas's account of Epictetus is in other respects inaccurate. But the strongest argument against Suidas is derived from Aulus Gellius, who, writing during the reign of the first Antonine, speaks of Epictetus in two places as being dead. ('*Noct. Att.*' ii. 18; xvii. 19.)

Epictetus led a life of exemplary contentment, simplicity, and virtue, practising in all particulars the morality he taught. He lived for a long while in a small hut, with no other furniture than a bed and lamp, and without an attendant; until he benevolently adopted a child whom a friend had been compelled by poverty to expose, and hired a nurse for its sake. There is a story connected with his lamp which illustrates the equanimity of Epictetus. He had bought one day an iron lamp, which was very soon after stolen from his hut, while he was himself standing in a corner wrapped in meditation; and when on looking up he came to miss it, he observed with a smile, "I shall disappoint this thief to-morrow, for if he comes back for another lamp, he shall only find an earthen one." (Arrian, '*Epict.*' ii. 6.) Neither was it in trifles alone that his equanimity was manifested, as the anecdote of his patience under his master's cruelty may suffice to prove. The biographers of Epictetus have taken particular care to commemorate his love of neatness.

Epictetus was a teacher of the Stoic philosophy, and the chief of those who lived during the period of the Roman empire. An anecdote given in the '*Discourses.*' collected by Arrian (i. 7) seems to show that he had been a pupil of Musonius Rufus, a Stoic philosopher whom Nero banished to Gyara, and who was subsequently recalled to Rome by Vespasian. The lessons of Epictetus were principally, if not solely, directed to practical morality. His favourite maxim, and that into which he resolved all practical morality, was 'bear and forbear.' He appears to have differed from the Stoics on the matter of suicide. (Arrian, '*Epict.*' i. 3.) We are told by Arrian in his Preface to the '*Discourses.*' that he was a powerful and exciting lecturer; and, according to Origen ('*C. Celæ.*' vi. ad init.), his style was superior to that of Plato. It is a proof of the estimation in which Epictetus was held that, on his death, his lamp was purchased by some more eager than wise aspirant after philosophy for three thousand drachmæ. (Lucian, '*Adv. Indoct. libr. ament.*' tom. ii. p. 386.)

Though it is said by Suidas that Epictetus wrote much, there is good reason to believe that he himself wrote nothing. His '*Discourses.*' were taken down by his pupil Arrian, and published after his death in six books, of which four remain. The same Arrian compiled the '*Encheiridion.*' and wrote a life of Epictetus, which has been lost. [ARRIAN.] Some fragments have also been preserved by Stobæus.

The best edition of all the remains of Epictetus is that by Schweighæuser, in six volumes, Leipzig, 1799. The same editor has published the '*Encheiridion.*' together with the '*Tablet of Cobes.*' in a separate volume. Coray published an edition of the '*Encheiridion.*' with a French translation by another hand, in the seventh volume of the *Parerga* of his '*Bibliotheca Græca.*' Paris, 1826, 8vo. There is an English translation of the '*Encheiridion.*' or '*Manual.*' by Mrs. Carter.

(Bayle, *Dictionary*; Fabricii, *Bibliotheca Græca*, ed. Harles, vol. v., p. 64.)

EPICURUS was born in the year B.C. 341, seven years after the death of Plato. He was born in the island of Samos, whither his father had gone from Athens in the year B.C. 352, among 2000 colonists then sent out by the Athenians. (Strab. xiv. p. 638.) He was however an Athenian born, belonging to the deme Gargettus, and to the tribe *Ægea*. His father Neocles is said to have been a schoolmaster, and his mother Chæristrate to have practised arts of magic, in which it was afterwards made a charge against Epicurus that, when he was young, he assisted her. (Diog. Laert., x. 4.) Having passed his early years in Samos and Teos, Epicurus went to Athens at the age of eighteen. We are told that he had begun to study philosophy when only fourteen, having been incited thereto by a desire, which the teachers whom he had applied to had failed to satisfy, of understanding Hesiod's description of chaos; and that he began with the writings of Democritus. In Samos he is said to have received lessons from Pamphilus, a follower of Plato. (Suidas; Cic. '*De Nat. Deor.*' i. 28.) At the time when Epicurus arrived in Athens, Xenocrates was teaching in the academy, and Theophrastus in the Lyceum; and we may suppose that he did not fail to avail himself of the opportunities of instruction which were thus within his reach. Indeed it was stated by Demetrius Magnes (Diog. Laert., x. 13) that Epicurus was a pupil of Xenocrates. He is also said, on the testimony of Apollodorus, to have received lessons from Lysiphanes and Praxiphanes; and again it is stated that he was a pupil of Nausiphanes. (Id. x. 14; Suid.) It was however Epicurus's wont to boast that he had learnt from no man but himself.

On the occasion of his first visit to Athens, Epicurus stayed there for a very short time. He left it in consequence of the measures taken

by Perdiccas after the death of Alexander the Great, and went to Colophon to join his father. In his thirty-second year, B.C. 310, he went to Mitylene, where he set up a school. Staying only one year at Mitylene, he next went to Lampsacus, where he taught for four years. He returned to Athens in the year B.C. 306; and now founded the school which ever after was named from him. He purchased a garden for eighty minæ, wherein he might live with his disciples and deliver his lessons, and henceforth remained in Athens, with the exception only of two or three visits to his friends in Asia Minor, until his death in the year B.C. 270. The disease which brought on his death was the stone. He was in his seventy-second year when he died, and he had been then settled in Athens as a teacher for thirty-six years.

Epicurus is said by Diogenes Laertius (x. 9) to have had so many friends "that even whole cities could not contain them." Pupils came to him from distant places, very many from Lampsacus; and while men often deserted other schools to join that of Epicurus, there were only two instances at most of Epicurus being deserted for any other teacher. So remarkably was this the case (and it continued to be so as long as the Epicurean school lasted), that it is related as a question put to Arcesilaus, "why men change from other sects to that of the Epicureans, but never leave this?" (Diog. Laert., iv. 43.) Epicurus and his pupils lived together, in the garden which has been mentioned, in a state of friendship, which, as it is usually represented, could not be surpassed; abstaining from putting their properties together, and enjoying them in common, for the quaint yet significant reason that such a plan implied mutual distrust. The friendship subsisting between Epicurus and his pupils is commemorated by Cicero ('De Fin.', i. 20.) In this garden too they lived in the most frugal and virtuous manner, though it was the delight of the enemies of Epicurus to represent it differently, and though Timocrates, who had once been his pupil, and had abandoned him, spread such stories as that Epicurus used to vomit twice a day after a surfeit, and that many immodest women were inmates of the garden. (Diog. Laert., x. 6, 7.) An inscription over the gate of the garden told him who might be disposed to enter, that barley-cakes and water would be the fare provided for him (Seneca, 'Ep.' 31); and such was the chastity of Epicurus, that one of his principal opponents, Chrysippus, endeavoured to account for it, so as to deny him any merit, by saying that he was without passions. (Stob., 'Serm.' 117.) Epicurus did not marry, in order that he might be able to prosecute philosophy with less interruption. His most attached friends and pupils were Hermachius of Mitylene, whom he appointed by will to succeed him as master of the school; Metrodorus, who wrote several books in defence of his system, and for whose children Epicurus in his will liberally provided; and Polæmon. Epicurus's three brothers, Neocles, Chæredemus, and Aristobulus followed his philosophy; as also one of his servants, Mysis, whom at his death he made free. Besides the garden in Athens, from which the followers of Epicurus in succeeding time came to be named the philosophers of the garden (Juv., 'Sat.' xiii. 122, xiv. 319), Epicurus possessed a house in Melite, a village near Athens, to which he used often to retire with his friends. On his death, he left this house, together with the garden, to Hermachius, as head of the school, to be left by him again to whomsoever might be his successor.

Epicurus divided the whole field of knowledge into three parts, to which he gave the names respectively of 'canonics,' 'physics,' and 'ethics.' The first two were subordinate to the third. The end of all knowledge, of ethics directly or immediately, of canonics and physics indirectly or mediately through ethics, was, according to Epicurus, to increase the happiness of man.

Canonics, which was a subject altogether introductory both to physics and ethics, treated of the means by which knowledge, both physical and ethical, was obtained, and of the conditions or (as they were called by Epicurus) 'criteria' of truth. These conditions or criteria were, according to him, sensations (*αἰσθήσεις*), ideas or imaginations (*εἰκασίματα*), and affections (*πάθη*). From these three sorts of consciousness we get all our knowledge. What Epicurus then called canonics, viewed in relation to physics and ethics, is, viewed absolutely or in itself, psychology. Epicurus seems to have explained rightly the dependence of ideas upon sensations (Diog. Laert., x. 33); but in accounting for sensations, he, like Democritus, left the path of sound psychology, and introduced the fanciful hypothesis of emanations from bodies.

In physics he trod pretty closely in the footsteps of Democritus [Democritus]; so much so that he was accused of taking his atomic cosmology from that philosopher without acknowledgment: he made indeed very few and unimportant alterations. According to Epicurus, as also to Democritus and Leucippus before him, the universe consists of two parts, matter and space, or vacuum, in which matter exists and moves; and all matter, of every kind and form, is reducible to certain indivisible particles, atoms, which are eternal. These atoms, moving, according to a natural tendency, straight downwards, and also obliquely, have thereby come to form the different bodies which are found in the world, and which differ, in kind and shape, according as the atoms are differently placed in respect of one another. It is clear that in this system a creator is dispensed with; and indeed Epicurus, here again following Democritus, set about to prove, in an *a priori* way, that this creator could not exist, inasmuch as nothing could arise out of nothing, any more than it could utterly perish and become nothing.

The atoms have existed always, and always will exist; and all the various physical phenomena are brought about, from time to time, by their various motions.

It remains to speak of the Epicurean system of ethics. Setting out from the two facts, that man is susceptible of pleasure and pain, and that he seeks the one and avoids the other, Epicurus propounded that it is a man's duty to endeavour to increase to the utmost his pleasures and diminish to the utmost his pains; choosing that which tends to pleasure rather than that which tends to pain, and that which tends to a greater pleasure or to a lesser pain, rather than that which tends respectively to a lesser pleasure or to a greater pain. He used the terms pleasure and pain in the most comprehensive way, as including pleasure and pain both of mind and of body; and he esteemed the pleasures and pains of the mind as incomparably greater than those of the body. Making then good and evil, or virtue and vice, depend on a tendency to increase pleasure and diminish pain, or the opposite, he arrived, as he easily might do, at the several virtues to be inculcated and vices to be denounced. And when he got thus far, even his adversaries had nothing to say against him. It is strange that they should have continued to revile the principle, no matter by what name it might be called, when they saw that it was a principle that led to truth. But even in our own age and country the same cry has been raised; and men, ignorant of the principles of the ancient and of the modern philosopher alike, have endeavoured, by bringing to bear on it as a hard name the name Epicurean, to crush the philosophy of Bentham.

Though Epicurus dispensed with a Divine Being as creator of the world, he yet did not deny the existence of gods. That there was an inconsistency in this is obvious. But he professed that the universal prevalence of the ideas of gods was sufficient to prove that they existed; and thinking it necessary to derive these ideas, like all other ideas, from sensations, he imagined that the gods were beings of human form, hovering about in the air, and made known to men by the customary emanations. He believed that these gods were eternal and supremely happy, living in a state of quiet, and meddling not with the affairs of the world. He contended that they were to be worshipped on account of the excellence of their nature, not because they could do men either good or harm. (Cic., 'De Nat. Deor.', i. 41; Seneca, 'De Benef.', iv. 19.)

The two chief sources of knowledge concerning the doctrines of Epicurus are the tenth book of Diogenes Laertius, and the poem of Lucretius 'De Rerum Natura.' In the first of these are letters from Epicurus himself to three of his friends, which give a brief account of all the parts of his system. Information is furnished also by the writings of Cicero, principally the 'De Finibus' and the 'De Natura Deorum,' by those of Seneca; and the treatise of Plutarch, entitled 'Against Colotes.'

Epicurus was, according to Diogenes Laertius, a more voluminous writer than any other philosopher, having written as many as 300 volumes, in all of which he is said to have studiously avoided making quotations. All that now remains of his works are the letters contained in the tenth book of Diogenes Laertius, and parts of two books of his treatise on Nature (*τὰ φυσικά*), which were discovered at Herculaneum. The last were published at Leipzig in 1818, being edited by Orelli. A critical edition of the first two letters of Epicurus was edited by J. Glo. Schneider, Leipzig, 1813.

Diogenes Laertius is the principal authority for the life of Epicurus; brief and incidental notices are also supplied by Suidas, Cicero, Seneca, and Plutarch. There is an account of the life and defence of the character of Epicurus, in eight books, by Gassendi (Lugd. Bat., 1647), and a life by a Frenchman of the name of Rendal (Par., 1679). It is unnecessary to mention the accounts given in Fabricius, Bayle, and all the common histories of philosophy.

The Epicurean school was carried on, after Hermachius, by Polystatus and many others, concerning whom nothing particular is known; and the doctrines which Epicurus had taught underwent few modifications. When introduced among the Romans, these doctrines, though very much opposed, were yet adopted by many distinguished men, as Lucretius, Atticus, Horace; and under the emperors, Pliny the Younger and Lucian of Samosata were Epicureans. A list of Epicureans among the Greeks and Romans will be found in Fabricius, 'Bibliotheca Græca,' ed. Harles., vol. iii. pp. 598-614.

EPIMENIDES was born in the year B.C. 659 (Suidas), at Phæstus, in Crete, according to some accounts; or at Cnossus, according to others; he was certainly a citizen of the latter place, though his father appears to have been a Phæstian. (Diog. Laert., i. 109.) He passed his youth in solitary retirement, which is explained in the ancient account as a supernatural sleep into which he fell when a youth, and did not awake till more than fifty years after, when he made his appearance among his fellow-citizens with long hair and a flowing beard, and with knowledge of medicine and natural history, which then appeared more than human. The event of his life for which he is best known, was his visit to Athens at the request of the inhabitants, in order to pave the way for the legislation of Solon by purifications and propitiatory sacrifices. These rites were calculated, according to the spirit of the age, to allay the feuds and party dissensions which prevailed there; and although what he enjoined was mostly of a religious nature (for instance, the sacrifice of a human victim, the consecration of a temple

to the Eumenides, and of two altars to Hybris and Anadeia, the two evil powers which were exerting their influence on the Athenians), there can be little doubt but that his object was political, and that Solon's constitution would hardly have been accepted had it not been recommended and sanctioned by some person who, like Epimenides, claimed from men little less than the veneration due to a superior being. The Athenians wished to reward Epimenides with wealth and public honours, but he refused to accept any remuneration, and only demanded a branch of the sacred olive-tree and a decree of perpetual friendship between Athens and his own country, Cnossus. Epimenides visited Athens about the year B.C. 596, and died soon after his return to Crete. He wrote a poem on the Argonautic expedition, and other works, which are entirely lost. For a more detailed account of this remarkable personage the reader is referred to G. F. Heinrich's 'Epimenides aus Kreta,' Leipzig, 1801.

EPIPHANIUS, SAINT, a Christian bishop and author, of the 4th century, was born of Jewish parents at a village called Besanducan, near Eleutheropolis, in Palestine. He spent his youth under the discipline of the Gnostics in Egypt, where he acquired a great fondness for the monkish asceticism then so prevalent in that country. Having become a zealous disciple of Hilarion, the patriarch of the monks of Palestine, he founded and long presided over a monastery near his native village. About the year 368 he was made bishop of Salamis, the metropolis of the island of Cyprus, where he continued about 36 years, and composed most of his writings. His spirit of opposition was especially excited by the Platonic doctrines of the learned and laborious Origen, against which he wrote and preached with implacable bitterness. On this subject he hotly quarrelled, in 391, with John, bishop of Jerusalem, who favoured Origen's views; but he found in Theophilus, the violent bishop of Alexandria, a worthy coadjutor, who in 399 convened a council, and condemned all the works of Origen. Epiphanius himself then called a council in Cyprus A.D. 401, and reiterated this condemnation, after which he wrote to St. Chrysostom, then bishop of Constantinople, requesting him to do the same; and on finding this prelate disinclined to sanction his violent proceedings, he forthwith repaired to Constantinople for the purpose of exciting the bishops of that diocese to join in executing the decrees which his Cyprian council had issued; but having entered a church in the city in order to repeat his anathemas, he was forewarned by Chrysostom of the illegality of his conduct, and was obliged to desist. Exasperated at this disappointment, he applied to the imperial court for assistance, where he soon embroiled himself with the Empress Eudoxia; for, on the occasion of her asking him to pray for the young Theodosius, who was dangerously ill, he replied that her son should not die provided she would not patronise the defenders of Origen. To this presumptuous message the empress indignantly answered, that her son's life was not in the power of Epiphanius, whose prayers were unable to save that of his own arch-deacon, who had recently died. Failing to gratify his animosity, he resolved to return home, but died at sea, on his passage to Cyprus, A.D. 403. His works in Greek were first printed in fol. at Basel, in 1544. Several editions, with a Latin translation by Cornarius, subsequently appeared at Basel and at Paris during the 16th century; but the best is by Petavius, who made a new Latin translation of the Greek text, and added a biography of the author and critical notes. This edition is in 2 vols. fol., Paris, 1622, and Cologne, 1682. In the 'Epiphanius Opuscula, ex editione Petavii,' are some very curious and valuable old prints. The principal works of Epiphanius are, 1, The 'Panarion,' or a treatise on Heresies, that is, peculiar sects. This is the most important of the author's writings. It treats of 80 sects, from the time of Adam to the latter part of the 4th century. The first section of the first three books into which the treatise is divided contains an account of 20 heretical sects before the birth of Christ; the remaining portion is occupied with the description of 60 heresies of Christianity. 2, 'Anacephalosis,' or an Epitome of the Panarion. 3, 'Ancoratus,' or a Discourse on the Faith; explaining the doctrine of the Trinity, Resurrection, &c., in confutation of the Pagans, Manicheans, Sabellians, and Arians. 4, A Treatise on the ancient Weights, Measures, and Coins of the Jews, with a Catalogue of Canonical Scriptures. Besides this there are several treatises and epistles, some of which are falsely attributed to Epiphanius. (See Riveti, 'Crit. Sacr.' c. 28 and 29.)

Epiphanius was an austere and superstitious ascetic, and, as a bitter controversialist, he often resorts to untrue arguments for the refutation of heresy. That his inaccuracy and credulity were equal to his religious zeal is apparent from his numerous mistakes in important historical facts, and his reliance on any false and foolish reports. Jerome admires Epiphanius for his skill in the Hebrew, Syriac, Egyptian, Greek, and Latin languages, and accordingly styles him, Pentaglottos, or the Five-tongued; but Scaliger calls him an ignorant man, who committed the greatest blunders, told the greatest falsehoods, and knew next to nothing about either Hebrew or Greek. However his writings are of great value as containing numerous citations from curious works which are no longer extant.

(Du Pin, *Bibliothèque Ecclésiastique* tom. 2; Cave, *Lit. Hist.*; Bayle, *Dict.*; Dr. A. Clark, *Succession of Sacred Literature*; Neander, *Church History*.)

EPISCOPIUS, SIMON (whose real Dutch name was Biscoop),

was one of the most learned men of the 17th century, and the chief supporter of the anti-calvinistic doctrines advocated by his contemporary Arminius. He was born in the year 1583, at Amsterdam, where he received his school education. In 1600 he went to the then newly-founded university of Leyden, of which he became a distinguished member, and entered with zeal and great ability into the predestinarian controversy between the Arminians and Gomarites, which at that time excited a deep and general interest. He was ordained in 1610, as the minister of the village of Bleyswyck, near Rotterdam, and in the following year he was deputed to the office of Arminian advocate at the conference held at the Hague between the Remonstrants and their opponents, the Calvinists. He was chosen to fill the chair of professor of divinity in the university of Leyden, as the successor of Professor Gomar. The predestinarian controversy was carried on shortly after with such virulence and popular excitement that Episcopius was not only exposed in the streets and in the pulpit to the greatest abuse and insult, but, on one occasion, barely escaped from being stoned to death. The predominant party of Calvinists treated him with great injustice and tyranny at the synod of Dort, to which he went as a deputy from the states of Holland. He was refused a hearing in behalf of the less numerous party of Arminians. He was told that the synod had met not to discuss but to judge, and it having been decreed that he and the other professors who formed the body of the Arminian delegates should neither explain nor maintain any point without being asked to speak, Episcopius and his colleagues refused to submit. They were, in consequence, expelled from the synod, and were subsequently deposed from the functions of the ministry and banished from the territory. Episcopius retired to France, and continued to write in defence of Arminianism, and to console and encourage his unfortunate brethren. In 1626, when sectarian animosity had somewhat subsided, he returned to Holland, and became the minister of the church of Remonstrants at Rotterdam. Finally, he was made rector of the college founded by the Remonstrant party at Amsterdam, where he died in 1643, at the age of sixty. His works were published collectively in 2 vols. fol., entitled 'Opera Omnia Theologica,' &c., Curcellami edita. Amsterdam, 1650, 1665, and 1671; and in London in 1678. They consist chiefly of the following treatises: 'Collegium Disputationum Theologicarum in Academia Leydensi,' Dordrecht, 1588; 'Fur Prædestinatus,' Dort, 1642; 'Antidotum adversus Synodi Dordtracensis Canones,' 'Confession of Faith,' 'Popish Labyrinth, or a Treatise on Infallibility,' &c., English translation, London, 1763. The latter works were written on the occasion of the author's being solicited by Peter Wadingus, a learned Jesuit, to become a Papist.

(*Life of Episcopius*, by Limborch, and by Curcellæus; *Life and Death of Arminius and Episcopius*, London, 1672, 12mo; Moreri, &c.)

ERASMUS was born on the 28th of October 1467, at Rotterdam. He was the illegitimate son of a citizen of Gouda, named Gerrit (Gerard), which, according to a pedantic fashion of the day, he translated doubly into Desiderius Erasmus; and in future years he found time to lament his carelessness in calling himself Erasmus instead of by the more accurate form Erasmius. During his father's life he was well and tenderly educated; but at the age of fourteen he fell into the hands of dishonest guardians, who wasted his patrimony, and to conceal their peculations, drove him, very unwillingly, into a monastery. He took the vows at Stein in 1486. Fortunately his skill in Latin caused him to be employed as private secretary to the bishop of Cambrai, who in 1496, at the end of their connection, authorised him to proceed to Paris to continue his studies, instead of returning to the monastic life, which he hated. At Paris Erasmus barely supported himself, by taking pupils, in sickness and poverty. For many years he led a wandering life, relying on the bounty of those patrons who were attracted by his learning and sprightly wit, sometimes in France, sometimes in the Netherlands, sometimes in England, to which he was a frequent visitor. In England he became intimate with More, Colet, dean of St Paul's, and other learned men, of whom he has spoken in high terms of praise; and England, if any permanent establishment had been offered, would have been the home of his choice. For several years he applied himself diligently to the study of Greek, which, after ages of general neglect, was just beginning to be an object of attention. He was 'autodidactos' (self-taught) he says; and one of his favourite employments was the translation of short Greek treatises into Latin, which answered the double purpose of improving himself, and furnishing him with a number of books to dedicate to his wealthy friends; for in those days the honour of a dedication was generally acknowledged by a handsome present. Careless however of economy, and not averse to pleasure, Erasmus was continually in want; and in one of his letters (xii. 21) he duns Colet for fifteen angels, promised as the price of the dedication of his treatise 'De Copia Verborum.'

In 1506 Erasmus paid his first visit to Italy, during which he obtained from Pope Julius II. a dispensation from his monastic vows. At Bologna, Venice, and Padua, he improved his knowledge of Greek under the instruction of the best Greek and Italian scholars. At Rome he met with a flattering reception, and promises of high advancement; but having engaged to return to England he did so in 1510, in the expectation that the recent accession of Henry VIII., with whom he had for some time maintained a correspondence, would ensure to him an honourable provision. During this visit he resided

for some time at Cambridge, where he was appointed Lady Margaret professor (in divinity), and also lectured on Greek. His lodging was in Queen's College, in the grounds of which Erasmus's Walk is still shown. But not finding his expectations likely to be fulfilled, he accepted an invitation from the archduke, afterwards Charles V., and went to Brabant in 1514, with the office of councillor, and a salary of 200 florins. After this we find him resident sometimes in the Netherlands, sometimes at Basel, where the great work in which he had been many years engaged, the first edition of the New Testament in Greek, was published in 1516, accompanied by a new Latin translation. Some amusing specimens of the objections made to this undertaking by the ignorant clergy will be found in his 'Letters' (vi. 2).

At the dawn of the Reformation, Erasmus, who in his witty writings had exposed many abuses of the Roman Catholic Church, especially those connected with the monastic system, was much embarrassed. It is clear that at heart he went a long way with the reformers, whose tenets he cautiously abstains from censuring, even in letters to dignitaries of the church, where he speaks of Luther himself in no very friendly terms. But he was of a timid temper, disinclined to sacrifice either life or comfort to his opinions, for he says of himself, in a letter to Pace, dean of St. Paul's, "Even if Luther had spoken everything in the most unobjectionable manner, I had no inclination to die for the sake of truth. Every man has not the courage to make a martyr; and I am afraid, if I were put to the trial, I should imitate St. Peter." This backwardness brought on him some harsh rebukes from Luther, who nevertheless had an esteem for his person as well as a regard for his talents; and calls him, in a letter written in 1519 (vi. 3), "*Decus nostrum et spes nostra*" ("our glory and our hope"). Neither did the zealots of the other side regard him with more favour. Erasmus, it was said, laid the egg, and Luther hatched it; and no doubt the pungency of his satire had its effect in opening men's eyes, and preparing for the graver warfare of the great reformer.

He removed to Basel in 1521, where, in 1522, his celebrated 'Colloquies' were published. They were composed ostensibly to supply young persons with an easy school-book in the Latin language, and at the same time to teach them religion and morals. For the purpose of teaching the Latin language this little book seems peculiarly well adapted: it was long used for this purpose in England, in the northern parts of which it was, till very lately, in use, and perhaps still is in some places. In these 'Colloquies,' which are generally very amusing, Erasmus has made some of his smartest attacks on various superstitions of the Roman Catholic Church. On this account the book was prohibited. In 1529 Erasmus removed to Freiburg, when the reformed party acquired the ascendancy in Basel: for to the last he never threw off an external adherence at least to the ancient faith. But in 1535 he returned to his former place of abode, endeared as it was by the presence of his most valued friends, in hope of renovating his declining health. About this time he received testimonies of high respect from Pope Paul III., who gave him a benefice, and expressed the intention of raising him to the rank of cardinal. But these favours came too late to benefit him. He died at Basel, July 12, 1536, leaving an enduring reputation as the first wit of his age, the man of most general learning, and the most active and serviceable instrument in bringing about the revival of sound learning. Nor were his contributions small towards the success of the Reformation; he was an able sapper, though he wanted energy to storm the breach with Luther and his associates.

His 'Encomium Morie' ('Praise of Folly'), written in England in 1510, a very witty production, was meant to show that there are fools in all places, however high, even in the court of Rome. It had a great run, and Leo X. is said to have been much amused by it; but at the same time it made its author many enemies among those who loved the abuses or were too partial to see the faults of the church, and did more than any of his works, except the 'Colloquies,' to fix the charge of heterodoxy on him. The 'Adagia' (1498), a large collection of proverbs, explained and commented upon with great learning, is another of his most interesting works. 'Enchiridion Militie Christiane' (1503) is a valuable manual of practical religion; the 'Ciceronianus' is an elegant and stinging satire on the folly of those pedants who, with a blind devotion, refused to use in their compositions any words or phrases not to be found in Cicero. Erasmus's own Latin style is clear and elegant: not always strictly classical, but like that of one who spoke and wrote Latin as readily as his mother tongue. His 'Letters,' comprising those of many learned men to himself, form a most valuable and amusing collection to those who are interested in the manners and literary histories of the age in which they were written; and several of them in particular are highly valuable to Englishmen as containing a picture of the manners of the English of that day. Of his numerous works, those which we have mentioned are most likely to be read with pleasure in the present day; the rest of them consist chiefly of translations, theology, grammar, and occasional treatises addressed to his friends and patrons.

His greatest work however was the edition of the New Testament, in Greek, from manuscripts, for the first time; for though that portion of Scripture was printed in the Complutensian Polyglot so early as 1514, it was not published till 1522; while the Editio Princeps of Erasmus was published in 1516. It is much commended by

Michaelis, who says—"Natural abilities, profound learning, a readiness in detecting errors, with every qualification that is requisite to produce critical sagacity, Erasmus possessed in the highest degree; and perhaps there never existed a more able editor of the New Testament. As an edition for common use however, it is of course superseded, in consequence of the accumulated knowledge of later labourers, and the great improvement in biblical criticism. Erasmus superintended the first Greek edition of the Geography of Ptolemaeus, which was printed at Basel by Frobenius in 1533, 4to. The edition was founded on good manuscript, but it contains numerous typographical errors. At Rotterdam there is a fine bronze statue of Erasmus, erected in 1622; at Basel there is a portrait of him by Holbein. The last edition of the complete works of Erasmus is that of Leyden, by Leclerc, 1703, 10 vols. folio, often bound in eleven.

ERASTUS, THOMAS, a physician, and the author of various medical works, but better known for the use made of his name in ecclesiastical discussions than in connection with his own profession, was born at Baden in Switzerland, on the 7th of September 1524. He obtained the rudiments of his education in his native place, and studied in the neighbouring city of Basel in 1540. There in 1544 he was attacked by the plague, and narrowly escaped death. He is said to have either on that or some other occasion lost the use of his right hand, but to have acquired the power of writing rapidly with the left. At Basel he seems to have studied divinity, philosophy, and literature. He afterwards went to Bologna, where he studied medicine, and appears to have speedily acquired a high scientific reputation. After having remained nine years in Italy, he went to Germany, and was by the Elector Palatine Frederic III. made professor of physic in the University of Heidelberg. The scientific character which he acquired in his own profession appears to have been that of one who did not take dogmas or theories for granted, but acted on induction from his own experience. He was appointed physician to the prince, and held rank as councillor of state in the Palatinate. He soon afterwards entered into polemical controversy. In 1564 a conference was held in the monastery of Maulbronn on the question of the real presence, or rather on the question whether the reference to the body and blood was not entirely figurative, at which Erastus maintained the view that it is figurative. He soon afterwards became involved in his celebrated controversy as to excommunication. A sort of fanaticism in favour of the use of ecclesiastical censures and punishments had been introduced by Olevianus, a refugee from Trier or Treves, and by several fugitives from the cruelties of the Duke of Alva in the Low Countries, and had spread among the Protestants of the Palatinate. Erastus termed it 'febris excommunicatoria,' and thought it an unwise policy for the Protestants, surrounded by their enemies, to be zealous in cutting off members from their own communion. He examined the principles and biblical authority of ecclesiastical censures, and carried on a controversy in which he was violently opposed by Dathenus, and more mildly by his friend Beza. This controversy would have probably died as a local dispute, had it not been revived by Castelvetro, who had married the widow of Erastus, publishing from his papers the theses called 'Explicatio Questionis gravissimæ de Excommunicatione,' which bears to have been written in 1568, and was thus published in 1589. The general principle adopted by Erastus is, that ecclesiastical censures and other inflictions are not the proper method of punishing crimes, but that the administration of the penal law, and of the law for compelling performance of civil obligations, should rest with the temporal magistrate. He held that the proper ground on which a person could be prohibited from receiving the ordinances of a church—such as the sacrament or communion of the Lord's Supper—was not vice or immorality, but a difference in theological opinion with the church from which he sought the privilege. The church was to decide who were its members, and thereby entitled to partake in its privileges, but was not entitled to take upon itself the punishment of offences by withholding these privileges, or by inflicting any other punishments, on the ground of moral misconduct.

Few authors so often referred to have been so little read as Erastus. The original theses are very rare. An English translation was published in 1669, and was re-edited by the Rev. Robert Lee in 1845. By some inscrutable exaggeration, it had become the popular view of the doctrines of Erastus, that his leading principle was to maintain the authority of the civil magistrate over the conscience, and to subject all ecclesiastical bodies to his direction and control, both in their doctrine and their discipline. In the discussions in the Church of Scotland, of which the result was the secession of a large body of the clergy and people because it was found that the Church could not make a law to nullify the operation of lay patronage, those who maintained within the church the principle that it had no such power were called Erastians as a term of reproach. As in all cases where such words as Socinian, Arian, Antinomian, &c., are used in polemical debates, the party rejected with disdain the name thus applied to it. But it is singular that in the course of this dispute no one seems to have thought of explaining that the controversy in which Erastus was engaged was about a totally different matter, and that only a few general and very vague remarks in his writings have given occasion for the supposition that he must have held the principle that all ecclesiastical authorities are subordinate to the civil. Erastus died at Basel on the 31st of December 1583, leaving a considerable sum for the

promotion of education in Basel and Heidelberg. He had published at the former town in 1585 a work 'De Discrimine Logice et Scientie Demonstrative.' He also wrote several works on medical science.

(Kresch und Gruber, *Allgemeine Encyclopädie*; Adamus, *Vita Germanorum Medicorum*, 107-109.)

ERATOSTHENES, a distinguished contemporary of Archimedes, is said to have been born at Cyrene in the year B.C. 276. He possessed a variety of talents seldom united in the same individual, but not all in the same eminent degree; his mathematical, astronomical, and geographical labours, are those which have rescued his name from oblivion.

The Alexandrian school of sciences, which flourished under the first Ptolemies, had already produced Timochares and Aristyllus, whose solstitial observations, made probably by the shadows of a gnomon, and by the armillary circles imitative of those of the celestial vault, retained considerable credit for centuries afterwards, though from these methods of observation they must have been extremely rude and imperfect.

Eratosthenes had not only the advantages arising from the instruments and observations of his predecessors, but the great Alexandrian library, which probably contained all the Phœnician, Chaldaic, Egyptian, and Greek learning of the time, was entrusted to his superintendence by the third Ptolemy (Euergetes), who invited him to Alexandria; and we have proof in the scattered fragments which remain to us of this great man, that these advantages were duly cultivated to his own happiness and the progress of infant astronomy.

The only work attributed to Eratosthenes, which has come down to us entire, is entitled 'Catasterismi,' and is merely a catalogue of the names of forty-four constellations, and the situations in each constellation of the principal stars, of which he enumerates nearly five hundred, but without one reference to astronomical measurement: we find Hipparchus quoted in it, and mention made of the motion of the pole, that of the polar star having been recognised by Pytheas. These circumstances, taken in conjunction with the vagueness of the descriptions, render its genuineness extremely doubtful; at all events, it is a work of little value. It may be seen in the Oxford edition of 'Aratus,' and was republished by Schaumbach, with notes by Heyne (Götting, 1795). A more correct edition of the text was published by F. K. Matthiæ, in his edition of 'Aratus' (Frankfurt, 1817, 8vo); and by A. Wesermann, in his 'Scriptores Historiarum Poeticarum Græci,' pp. 239-267.

If Eratosthenes be really the author of the treatise 'Catasterismi,' it must have been composed merely as a 'vade mecum,' for we find him engaged in astronomical researches far more exact and more worthy of his genius. By his observations he determined that the distance between the tropics, that is, twice the obliquity of the ecliptic, was $\frac{1}{2}$ of an entire circumference, or $47^{\circ} 42' 39''$, which makes the obliquity to be $23^{\circ} 51' 19\frac{1}{2}''$, nearly the same as that supposed by Hipparchus and Ptolemæus. As the means of observation were at that time very imperfect, the instruments divided only to intervals of $10'$, and corrections for the greater refraction at the winter solstice, for the diameter of the solar disc, &c., then unknown, we must regard this conclusion as highly creditable to Eratosthenes.

His next achievement was to measure the circumference of the earth. He knew that at Syene (now Assouan) the sun was vertical at noon in the summer solstice; while at Alexandria, at the same moment, it was below the zenith by the fiftieth part of a circumference: the two places are nearly on the same meridian (error 2°); neglecting the solar parallax, he concluded that the distance from Alexandria to Syene is the fiftieth part of the circumference of the earth; this distance he estimated at 5000 stadia, which gives 250,000 stadia for the circumference: the following diagram will explain the principle of this admeasurement:—

C the centre of the earth, A Alexandria, S Syene, S the sun, $\angle ZAS$ the $\frac{1}{2}$ of four right angles, $\angle ASC$ the sun's parallax, which is very small: $\therefore \angle ACS$ is very nearly $= \angle ZAS$; therefore distance $AC = \frac{1}{50}$ of circumference of earth.

Thus Eratosthenes has the merit of pointing out a method for finding the circumference of the earth: but his data were not sufficiently exact, nor had he the means of measuring the distance AS with sufficient precision.

Eratosthenes has been called a poet, and Scaliger, in his commentary on Manilius, gives some fragments of a poem attributed to him, entitled 'Hermes, or de Zonia,' one of which is a description of the terrestrial zones: it is not improbable that these are authentic; the chroniclers as well as philosophers of all nations, in a state of incipient civilisation, have called in the aid of metre to popularise their labours. Eratosthenes is therefore entitled to the name of a versifier rather than a poet, like his precursor Manetho, who wrote 'Ἀποτελεσματικά' (effects or influences), a mixture of astrology and astronomy; one of whose lines, containing the names of the sun and planets, may be taken as a specimen:—

Ζεὺς Ἀφρὴ Παρὴν Μῆρην Κρόνος Ἥλιος Ἐρμῆς.

The wretched doggerel arising from forcing names, scientific terms, and reasonings into verse, may be judged by some ridiculous productions of the kind in our own language.

That Eratosthenes was an excellent geometer we cannot doubt, from his still extant solution of the problem of two mean proportionals, preserved by Theon, and a lost treatise quoted by Pappus, 'De Locis ad Medietates,' on which Montucla has offered some conjectures, 'Histoire des Math.,' an. vii., p. 280.

Eratosthenes appears to have been one of the first who attempted to form a system of geography. His work on this subject, entitled 'Geographica' (Γεωγραφικά), was divided into three books. The first book contained a history of geography, a critical notice of the authorities used by him, and the elements of physical geography. The second book treated of mathematical geography, and contained the method above explained, by which he determined the earth's circumference. The third book contained the political or historical geography, arranged according to the three great divisions of the known globe, Europe, Asia, and Libya. The whole work was accompanied with a map of the known world. The geography of Eratosthenes is lost; the fragments which remain have been chiefly preserved by Strabo, who was doubtless much indebted to him.

Eratosthenes also busied himself with chronology. The reader will find some remarks on his Greek chronology in Clinton's 'Fasti Hellenici,' and on his list of Theban kings, by R. Rask, in his little work on the ancient Egyptian chronology, German translation, Altona, 1830.

The properties of numbers attracted the attention of philosophers from the earliest period, and Eratosthenes also distinguished himself in this branch by a work which he denominated *Κύκλιος*, 'Cribrum,' or 'Sieve,' the object of which is to separate prime from composite numbers, a curious memoir on which was published by Horsley in the 'Philosophical Transactions,' 1772. The principle of the method is to reject all the multiples of the primes, tabulating first all the odd numbers; the multiples of 3 will be found with intervals of two places, those of 5 with intervals of 4, and by placing a mark over each such multiple, none but prime numbers will remain after this shifting. The same method, which is indeed indirect, but comparatively rapid in application, has been employed by Ladislaus Chernac, in forming a table of primes from 1 to 1,020,000, in a treatise published in 1811: the following example will explain the method:—

3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 49.

By actually trying this method it will be seen how readily the composite numbers are marked out, and we may terminate the operation when our commencing number exceeds a third of the last number in the table.

Eratosthenes arrived at the age of eighty years, and ultimately becoming weary of life, died by voluntary starvation. (Suidas, 'Eratosthenes.') Montucla, with his usual naïveté, says it would have been more philosophical to await death 'de pied ferme.'

ERCILLA Y ZUNIGA, ALONSO, the author of the 'Araucana,' an epic poem, and better known out of Spain than many other Spanish works of greater merit. Alonso was the third son of a celebrated lawyer, Fortan Garco, lord of the castle of Errilla, and was born at Madrid in 1533. His mother, Doña Leonor de Zuniga, became a widow the following year, and being appointed 'guarda damas' to the wife of Charles V., soon obtained for her son a place among the pages of the prince of Asturias, afterwards Philip II. At the age of fourteen, Errilla attended that prince through Italy, Germany, and the Netherlands, in a pompous progress of which the

chronicler of Philip II., Calvete de Estrella, has left a picturesque account. He also accompanied Philip in his subsequent travels, and on the occasion of his marriage with Queen Mary, Ercilla came to England in 1554. While in London, he heard of a revolt of the brave Araucanians (Araucanos) against the Spaniards in Chile, and his military ardour being excited by the news, he volunteered to go to America. It was amidst the incessant toils and dangers of a campaign against barbarians, without shelter and with nothing to write on but small scraps of waste paper, and often only leather, struggling at once against enemies and surrounding circumstances, that, for the first time an iron-clad poet attempted to describe in epic strains the exploits in which he himself participated, and which he often directed. Thus did Ercilla write the first part of his 'Araucana,' so named from the war and country of Arauca. After numerous escapes from the dangers of the war, he was ordered to the scaffold (A.D. 1558) by a young and hasty commander, who thought he perceived a premeditated mutiny in a private quarrel which arose in the American city of Imperial, while the people were celebrating the accession of Philip II. to the crown. Ercilla, who on that occasion had to draw his sword in defence of his honour and life, was saved by the timely discovery of the injustice of the sentence which had been passed on him. Much impaired in health, although then only in his twenty-ninth year, the poet-soldier returned to Spain, but only to experience the continued neglect and disdain of Philip whom he had served all his life, whom he had already invoked as his Augustus, and whom he celebrated in the sequel of his poem. To exalt and propitiate his reluctant patron, he introduced into it the episodic battles of St. Quentin and Lepanto. The indignity which he still experienced induced Ercilla to ramble for some time over different parts of Europe, where the only favour he received was from the emperor Rudolph, who appointed him gentleman of his bed-chamber. At last he settled at Madrid, where he lingered in retirement and penury, writing poetry till his death, the time of which is not clearly ascertained. He was however alive in 1596, for Musquera de Figueira, in his 'Comentario de Disciplina Militar,' speaks of Ercilla as then engaged in celebrating the victories of Don Alvaro Bazan, marquis de Santa Cruz, in a poem which was never published, and was perhaps left incomplete.

The 'Parnaso Español' contains a short erotic poem, written by Ercilla in his youth, and highly commended by Lope de Vega in his 'Laurel de Apolo.' But it is only the 'Araucana' which has recommended Ercilla to posterity. He published the first part by itself; then the first and second parts together in 1577; and the whole three parts in 1590, many editions of which have appeared successively in different places. The severe censures passed on this poem by a host of biographers or compilers are in fact only a long file of repetitions, and much of the censure is founded on misconception.

Nothing short of a sketch, however brief, of the 'Araucana,' could give a just idea of its plan and execution. But it would however be unfair not to remind those who consider Ercilla as a second Lucan, that he undertook a much harder task than the Cordovan poet, who sang a mighty contest for the mastery of the world; while Ercilla had to contend against two features in his subject, the most unfavourable to an epic—a conquest not yet accomplished over a narrow, rocky, and unknown spot, and a brave and injured enemy struggling for their freedom. Still he succeeded in infusing an Homeric spirit into his long narration, which, independently of its other merits, is a real historical record.

ERICK, in Swedish, is synonymous with the German Heinrich, and the English Henry, and is the name of many kings of Sweden and of Denmark. Of the earlier kings of this name little is known, for the history of the Scandinavian nations previous to the 9th or 10th centuries of our era is very confused, and much of it is semi-fabulous. In the earlier centuries of our era the country now called Sweden was divided into several kingdoms or states, of which Sweden Proper and Gothia were the two principal. Sweden Proper comprised the central part of the present Sweden, and included the provinces of Upland, Sudermanland, Westmanland, Nerike, and part of Dalecarlia. The kingdom of Gothia comprised the southern part of the great Scandinavian peninsula, including the provinces of Ostrogothia and Westrogothia, divided by the Wetter Lake, Småland, Bohusland, Skåne, and Blekingen, with the isles of Gothland and Oeland. But the most southern provinces, especially Skåne, were for a long time a subject of contention with the Danes, who frequently occupied them.

There was also the kingdom of Wärmeland, north and west of the great Wener Lake, extending to the borders of Norway, and the kingdom of Helsingland, north of Sweden Proper, which included the provinces of Angermanland, Jämtland, East and West Bothnia, up to the wilderness of Lapland. Most of these provinces had each its separate chief or king, something like the earlier Saxon kingdoms in England; but the king of Sweden Proper, or of Upsal, as he was also called, was considered in ordinary times as the head of the whole, like the Bretwalda of the Saxon Heptarchy. Odin or Wodin, the conqueror of Scandinavia in the century previous to our era, is said to have kept Sweden for himself, allowing his relatives or companions to settle in the rest of Scandinavia as his vassals; and this superiority of Sweden was acknowledged for several centuries after, so that at the great general meetings of the Scandinavian nations the king of Den-

mark used to hold the bridle and the king of Norway the stirrup of the king of Sweden's horse. (Puffendorf.)

Among the earlier kings of Sweden, in the 5th and 6th centuries, we find several Ericks, of whom little or nothing is known. One of these reigned together with his brother Alrik as kings of Upsal from about 465 to 485. Another Erick and his brother Jorund, being the sons of Yngve Alrickson, were following the then common profession of sea-kings, or pirates, when a vacancy on the throne of Sweden, to which they had some family claim, recalled them home, about 525. They were opposed by the usurper Haco, when Erick was killed, and Jorund was obliged to escape. In the 9th century we find Erick Björnson reigning together with his father Björn Järnsida, about 864. Björn died in 870, and Erick reigned alone till 874, when he died abroad in some expedition. He was succeeded by his son Björn and his nephew Erick, the son of Refil, the Sea King, who reigned together for a time. The two kings went with a host to join their Norman friends at the siege of Paris in 886, when Charles the Fat was obliged to conclude a dishonourable peace. Björn appears to have died at the siege, and Erick Refilson returned home and died some years after. He was succeeded by Erick, son of the late Björn, who reigned together with his brother Björn, called of Hoga, from the place of his residence. After his death Erick Emundson, a grandson of Erick Refilson, was proclaimed king about 910, under the guardianship of his great uncle Björn of Hoga. Björn died in 925, and Erick remained sole king of Upsal. He sustained a war against Harald Harfager, king of Norway, and at his death was succeeded by his son, Björn IV.

Erick Segereäll, or the Victorious, reigned from 970 to 994. He retook Skåne and Halland from the Danes, and at last drove away their king, Sweno, from Denmark itself. He also defeated the Norwegians and Finlanders, and conquered Livonia, Esthonia, and Courland. Erick was succeeded by his son Olaf, or Olaus, who is mentioned as the first Christian king of Sweden.

In the year 1155, after the death of Swerker Kolson, the Otho-gothians chose his son Charles for their king, but the Swedes at their general assembly at Upsal elected Erick Jadwardson, a nobleman connected by alliance with both the royal families of Sweden and Denmark. He is styled Erick IX. by most chronologists, and he is also called Erick the Pious, or St. Erick. After some demur, the Gothians agreed that he should reign over both kingdoms, but that after his death Charles Swerkerson should succeed him. Erick brought back the Halsingers and the Jämtlanders to the Swedish allegiance. In 1157 he proceeded with troops to Finland, in order to subdue the natives and convert them to the Christian faith, and the Bishop of Upsal accompanied him on this expedition. The Finlanders were defeated, many of them were slain, and the rest were baptised. Christian churches were founded by the bishop, who remained in the country, while Erick returned to Sweden, where he employed himself in compiling a code of laws out of the ancient constitutions of the kingdom. This compilation is known by the name of St. Erick's law. Erick is remembered in history as a good king. In 1161, on the 11th of May, as he was in the neighbourhood of Upsal, a party of Danes who had landed on the coast under Prince Magnus, surprised and killed him after a brave defence on his part. Magnus had his head cut off, and afterwards proclaimed himself king; but the Swedes and Gothians, uniting under Charles Swerkerson, fell upon the Danes and killed them all, together with their prince, and out of the spoil they built a church on the spot. Charles was then acknowledged as king of the Swedes and the Goths, the title which the kings of Sweden bear to this day.

Charles was killed by Knut, St. Erick's son, about 1168, who succeeded him; but after Knut's death, in 1192, the crown was again disputed between Erick Knutson and Swerker, the son of Charles, who was supported by the Gothians. After a long war Swerker was killed in battle, 1210, and left Erick Knutson in quiet possession of the throne. St. Erick's convention was then renewed, and John, the son of Swerker, was constituted heir to the throne, which was afterwards to return to Erick's descendants. Erick died in 1219, at Wisingsöe, which was the usual place of residence of the Swedish kings in those days.

Erick Erikson, son of the preceding, succeeded John in 1222, according to the convention, and reigned till 1250. His reign was at first distracted by civil war. The powerful family of Tolekunger, who were allied to the king by marriage, revolted against him; but they were defeated, and two of the leaders were put to death. Under this king Gulielmus Sabinensis, the pope's legate, first forbade marriage to the Swedish priests. Erick made war upon the Finlanders, who had revolted, and built several fortresses on their frontiers. He died at Wisingsöe without issue, and was succeeded by Waldemar I., his sister's son.

Erick, son of King Magnus, and of Blanche, daughter of the Flemish Earl of Namur, was made colleague to his father by a powerful party of the nobility in 1344. A war broke out between father and son in 1357, and at last the kingdom was divided between them, Erick having the whole southern part, including Skåne, East Gothia, Småland, &c. Erick was shortly after poisoned at an interview with his father, and it was reported, by the agency of his own mother.

ERICK, styled XIII. The Duke of Pomerania and nephew to Queen Margaret of Waldemar, who had united Sweden, Norway, and Den-

mark under her sceptre, was appointed by the General States of the three kingdoms assembled at Calmar in 1396 to be her successor. He married in 1410 Philippa, daughter of Henry IV. of England, and in 1412, after Margaret's death, he assumed the reins of government. But he soon gave proofs of incapacity, and his capricious and tyrannical sway disgusted the Swedes, to whom he preferred his Danish subjects. Becoming entangled in a tedious war with the dukes of Holstein and Mecklenburg and the Hanse Towns, in order to carry it on he loaded his subjects with taxes, while their commerce was ruined. He violated the articles of the Calmar union, stripped Sweden of its archives, which he took with him to Denmark, and filled most military and civil offices in Sweden with Danes and other foreigners. The Dalecarlians were the first to revolt, being led by a nobleman of the name of Englebrecht. They were joined by the North Hallanders and others, and at last they obliged the senate of the kingdom assembled at Wadstena to renounce its allegiance to Erick. Erick made a hasty peace with the Hanse Towns, collected a fleet with troops on board, and sailed for Stockholm. After repeated attempts, he was obliged to make a convention with the insurgents, by which the king retained garrisons in the three castles of Stockholm, Calmar, and Nyköping; all other situations in the kingdom being filled by Swedish natives. At the same time he promised to respect the articles of the Calmar union, and returned to Denmark. But his bad faith kept alive the discontent, and in 1438 the leaders of the Swedes entered into secret negotiations with the chief men in Denmark, who were likewise dissatisfied with Erick, and a general revolt ensued. Erick had already withdrawn from Denmark into the island of Gothland with his treasures. The Danes chose for their king Christopher, duke of Bavaria, king Erick's sister's son, and the Swedish Diet assembled at Arboga offered him likewise their crown under the stipulations of the Calmar union. Erick was allowed by Christopher to retain possession of the island of Gothland; but after Christopher's death in 1448 Charles Knutson, who succeeded to the throne of Sweden, besieged Erick in the town of Wisby. Erick escaped into Pomerania, with the assistance of Christian, king of Denmark, who sent him to the island of Rugen, where he ended his days.

ERICK XIV. of Sweden, the son of Gustavus Vasa, was acknowledged, by a diet held at Westeraas in 1544, as heir to the throne while he was in his eleventh year: he succeeded his father in 1559. He began by showing a considerable degree of jealousy towards his brothers John, Magnus, and Charles, whom their father had made dukes of Finland, East Gothia, and Sudermanland, as feudatories of the crown. He was also engaged in war with the Liflanders, or Livonians, who had placed themselves under the protection of Denmark and of Poland; but the Esthlanders remaining attached to Sweden, Erick sent an army to Revel for their protection, and successfully defended that place against the Poles. Erick had at one time, before he was king, been a suitor for the hand of Elizabeth of England, and after his accession to the throne he embarked to pursue his addresses in person. A violent tempest however having driven him back to Sweden, Erick, who was superstitious and a believer in astrology, gave up all thoughts of the match, and turned his attentions to Mary, queen of Scotland, but with no better result. His brother John having married Catharine, daughter of Sigismund, king of Poland, without Erick's consent, Erick besieged him in the castle of Abo, made him prisoner, and kept him and his wife in close confinement, until the remonstrances of the people obliged him to release them. At the same time a war broke out between Denmark and Sweden, in which the Swedes had the advantage in several sea fights. Meantime King Erick gave himself up entirely to his mistresses, and entrusted the care of the kingdom to his favourite Joram Pearson, an unprincipled man, by whose advice and that of Dionysius Burrhus, a Frenchman by birth and his former tutor, he put to death several noblemen, among others the Stures, father and son, who belonged to a powerful Swedish family of Nils Sture: one of them was stabbed by the king with his own hand. Erick even went so far as to concert a scheme to put to death his brothers at a great festival to be given at Stockholm, but having been apprised of it, they conspired against him, seized upon several castles, collected a force, and marched upon the capital. Erick, after some defence, was obliged to surrender; the assembly of the states deposed him in 1568, and he was kept a close prisoner in the castle of Gripsholm, where he was treated very severely. His brother John was proclaimed king of Sweden. After nine years' confinement, Erick was put to death by poison, by order of his brother, in 1577.

(Celsius, *Könung Erick den Fjortondes Historia*, 1795.)

ERICK, the name of several kings of Denmark:—

ERICK I. reigned about the 9th century. He is commonly reckoned as the first Christian king of Denmark, and it was under his reign that Ansgarius, bishop of Bremen, preached Christianity both in Denmark and in Sweden.

ERICK II. succeeded his brother Olaf, or Olaus IV., about the year 1096. He made war in Pomerania, and took Jutin, then a considerable town of that country. He greatly favoured the Christian religion, and obtained of the pope the establishment of the archbishopric of Laud in Scania, which then belonged to Denmark. Erick visited Rome, and died in the island of Cyprus about 1103, while on a pilgrimage to the Holy Land.

ERICK III., son of the preceding, made war against the Wendes, or

Vandals, who were carrying on piracy in the Baltic. He died about 1138, and was succeeded by

ERICK IV., his son, called the 'Lamb,' who turned monk at Odensee, in 1147.

ERICK V. succeeded his father Waldemar II. in 1241, and was murdered by his brother Abel in 1250, who succeeded him on the throne.

ERICK VI. succeeded his father Christopher I. in 1259, was engaged in war against the king of Norway, and was involved in disputes with his own nobles, who, at a diet held at Wyborg in 1282, obliged him to sign an act defining their privileges and the limits of the royal authority. He was taken prisoner in battle by Erick, duke of Holstein, and cruelly murdered in 1286.

ERICK VII. succeeded his father Erick VI., and continued the war against the king of Norway. He reigned till 1319, and was succeeded by his brother, Christopher II.

ERICK VIII., styled by some VII., is the same as Erick XIII. of Sweden, the nephew and successor of Margaret of Waldemar. [See ERICK XIII. OF SWEDEN.]

ERICSSON, JOHN, engineer, a native of Sweden, but whose inventions have been brought before the scientific world in England and America, was born in the province of Vermland in 1803. In 1814, by the friendship of Count Platen, who observed his mechanical tastes, he obtained a cadetship in a corps of Engineers. He subsequently entered the regular army as an ensign, and at length reached the rank of lieutenant. In 1826 he visited England in order to bring into notice a new kind of engine which he had invented, and which he proposed to work without steam, by the condensation of flame. The project failed from the impossibility of procuring suitable fuel for the engine. He competed for the prize which was offered by the Liverpool and Manchester Railway Company in 1829, for the production of the best locomotive, and presented an engine which went at the rate of fifty miles an hour. Ericsson's subsequent career lay chiefly in America. In the Great Industrial Exhibition of London in 1851, several instruments for the measurements of distances at sea, for measuring fluids under pressure, and other similar purposes, appeared in the American department under Mr. Ericsson's name, and were described by him in a small work which he issued at the time. His name is chiefly known in connection with a project for a caloric engine, which was to supercede steam, an object which, if accomplished would, by removing the necessity of carrying large cargoes of fuel, have effected a great commercial change in the intercourse between distant parts of the globe. As the principle did not obtain the sanction of the scientific men to whom the British government referred its consideration, Mr. Ericsson tried it in America, and obtained sufficient cooperation to enable him to launch a vessel named after himself, and measuring 2000 tons. This vessel made a trial trip, in which she sailed at the rate of twelve miles an hour, but on her return she was struck by a squall, filled, and foundered close to the city of Jersey. The Ericsson was subsequently raised, and the caloric engine was replaced by a steam engine, which possessed some improvements invented by Mr. Ericsson. Mr. Ericsson was a member of numerous scientific societies and a knight of the Swedish order of Vasa. He died on the 2nd of November 1853.

ERIGENA, JOANNES SCOTUS, a native of Ireland, whence his appellation of Erigena is derived, that of Scotus being synonymous with it, as the Irish were still called in foreign countries Scots in those times, flourished about the middle of the 9th century, and was a celebrated scholar of that age. He resided chiefly in France, at the court of Charles the Bald, who seems to have been very partial to him. His writings on theological matters were considered as heterodox, and his treatise on the Eucharist was condemned to be burnt by the council of Rome, in 1059. [BERENGUER.] His treatise on predestination is found in the 'Vindiciae Prædestinationis et Gratia,' 2 vols. 4to, 1650. In his work 'Dialogus de Divisione Naturæ' he displays a wonderful information for the times he lived in, and an intimate acquaintance with the Greek language. He gives large extracts from the Greek fathers, and also quotes Aristotle, Plato, Cicero, Pliny, and other ancient philosophers; and he gives the opinions of Pythagoras and Eratosthenes on some astronomical topics. In another part he inserts a very elaborate discussion on arithmetic. Hallam says that "it admits of no doubt that John Scotus was, in a literary and philosophical sense, the most remarkable man of the dark ages: no one else had his boldness, his subtlety in threading the labyrinths of metaphysical speculations, which in the west of Europe had been utterly disregarded." ('Middle Ages,' c. ix., pt. 1, note 2.) Erigena also translated from the Greek certain theological works attributed to Dionysius Areopagita. To the writings and translations of Erigena is attributed by some the introduction of the later Platonism of the Alexandrian school into the theology and metaphysics of Europe. Erigena is believed to have died in France about 876. He must not be confounded with Joannes Duns Scotus, who lived in the 13th century. [DUNS SCOTUS.]

ERINNA, a poetess and the friend of Sappho, flourished about the year B.C. 595. All that is known of her is contained in the following words of Eustathius (ad 'Iliad,' il. p. 327):—"Erinna was born in Lesbos, or in Rhodes, or in Teos, or in Telos, the little island near Cnidus. She was a poetess, and wrote a poem called 'The Distaff,'

in the *Æolic* and *Doric* dialect: it consisted of 300 hexameter lines. She was the friend of Sappho, and died unmarried. It was thought that her verses rivalled those of Homer. She was only nineteen years old when she died." Another poetess of this name is mentioned by Eusebius under the year B.C. 354. This appears to be the same person who is mentioned by Pliny ('*Hist. Nat.*, xxxiv. 8) as having celebrated Myro in her poems. We possess no fragments of either of these poetesses.

ERNESTI, JOHN AUGUSTUS, was born at Tennstadt, in the Thüringer Wald, on the 4th of August 1707. He was educated at Wittenberg and Leipzig, and in 1731 became corrector of the school of St. Thomas, Leipzig. He succeeded J. M. Gessner as rector in 1734. While engaged in this situation he acquired so great a reputation as a classical scholar that, in 1742, the University of Leipzig violated its own rule of never electing to any professorship the master of a school, and appointed him professor extraordinary of ancient literature. He was made professor of eloquence in 1756, and professor of theology, with the degree of Doctor, in 1758: he held the two last-named professorships together till 1770, when he gave up the former to his nephew, Augustus William. He died on the 11th September 1781. Ernesti was a man of considerable abilities, and especially of a very methodical mind, to which are due the great improvements in the system of teaching introduced by him. He was well acquainted with classics, and no mean proficient in theological learning. His Latin style is little inferior indeed to that of Ruhnken, and fully equal to that of Wytenbach; his knowledge of Greek, though less accurate, was very respectable. The work for which he is best known is his edition of Cicero, which has been made the basis of all subsequent ones. The third and last edition of this author published by him was printed at Halle in 1775. His '*Clavis Ciceroniana*,' or Index of words and subjects to Cicero's works, is still in general use. Besides his Cicero, Ernesti's '*Initia Doctrinæ Solidioris*' and '*Institutio Interpretis Novi Testamenti*' are much esteemed by students at the present day; the latter has been translated into English. His edition of Callimachus, which appeared in 1761, is suspected to have owed a good deal of what is valuable in it to the contributions of Ruhnken. An account of it is given in the '*Museum Criticum*,' vol. ii. p. 151. Ernesti's editions of Homer, Polybius, Tacitus, and Suetonius, have been long superseded by more recent and superior ones.

ERNESTI, AUGUSTUS WILLIAM, nephew of the preceding, was born at Frohdorf, near Tennstadt, the 26th of November 1733. He was a pupil of his uncle at Leipzig, was made professor of philosophy there in 1766, and, as has been mentioned, succeeded, in 1770, on his uncle's resignation, to the professorship of eloquence. He died of apoplexy on the 29th of July 1801. He was principally distinguished as a very good Latin scholar. His best known work is an edition of Livy, with a very copious glossary, which was reprinted twice in his lifetime; the third edition was in the press when he died, and was completed by Schäfer.

ERNESTI, JOHN CHRISTIAN THEOPHILUS, also a nephew of John Augustus, was born at Arnstadt, in the Thüringer Wald, in 1756. He was professor of philosophy in the University of Leipzig from 1782 to 1801, when he succeeded his cousin, Augustus William, as professor of eloquence. He died on the 5th of June in the following year. This scholar published editions of Silius Italicus and Æsop; '*Lexicon Technologicæ Græcæ Rhetoricæ*,' Lips., 1795; '*Lex. Techn. Romanorum Rhetoricæ*,' Lips., 1797 (both very useful works); '*Heeychii Glossæ Sacre*,' 1785; '*Suidæ et Phavorini Glossæ Sacre*,' 1786; a translation into German of Dumesnil's Latin Synonyms, and a German version of the principal works of Cicero.

ERPENIUS, THOMAS, or THOMAS VAN ERPEN, the celebrated orientalist, was born at Gorkum, Holland, on the 7th of September 1684. At the age of ten years he was sent to Leyden, where he received his education; and in 1698 he took the degree of Master of Arts in the university of that town. He had studied chiefly theology and oriental literature, and after the termination of his academic education, he undertook a tour to England, France, Italy, and Germany, for the farther prosecution of his favourite pursuits. At Paris he became acquainted with Isaac Casaubon, and availed himself of the Arabic instructions of a learned Maronite, Joseph Barbatius, then a resident in the French capital. Erpenius returned to his native country in 1612, and was in the following year appointed professor of Oriental languages in the University of Leyden, an office to which was added subsequently that of Arabic interpreter to the Netherlands. On two occasions, in 1620 and 1621, he was sent to Paris on business of the University of Leyden. With these interruptions he seems to have devoted himself exclusively to the cultivation of Oriental literature. He established an Arabic press at his own house, and employed himself in editing a number of works, which have been of the greatest utility in promoting the cause of Oriental learning. He died of a contagious disease at the age of forty, November 13th, 1624. The work which has contributed most to give celebrity to the name of Erpenius is his '*Grammatica Arabica, quinque libris methodice explicata*,' published at Leyden in 1618, 4to. It has often been re-edited with additions and alterations, and formed the basis of nearly every subsequent Arabic grammar printed in Europe down to that of Silvestre de Sacy. The most remarkable of Erpenius's other publications are the following:—'*Proverbiorum Arabicorum centuriæ duæ*,' Leyden,

1614 and 1623, 8vo; '*Loomani Sapientis Fabulæ et selecta quedam Arabum Adagia*,' Leyden, 1615, 8vo; an edition of an Arabic version of the New Testament and of the Pentateuch, the former published in 1616, the latter in 1622; an edition of the chronicle of Elmakin, with a Latin translation, published after his death, under the title of '*Historia Saracenicæ*,' Leyden, 1625, fol.; two original treatises on Arabic grammar, bearing the title '*Grammatica Arabica, dicta Giamuria, et libellus centum Regentium*,' Leyden, 1617, 4to; and a Hebrew Grammar, '*Grammatica Ebræa generalis*,' Leyden, 1621, 8vo.

ERSCH, JOHANN SAMUEL, was born June 23, 1766, at Glogau, in the Prussian province of Silesia. He commenced his studies in the gymnasium of his native town, and in the spring of 1785 removed to the university of Halle. Here he became acquainted with Professor Fabri, with whom in 1786 he went to Jena, where they became associated with Schütz and Hufeland in the publication of several political, geographical, and bibliographical works. In 1794 he removed to Göttingen, and in 1800 returned to Jena, where he was appointed librarian to the university. In 1803 he became professor of geography and statistics in the university of Halle, and in 1808 was appointed principal librarian. Besides being employed at all these places on various periodical publications, sometimes as editor and sometimes as contributor, he acquired a knowledge of the French, Italian, English, Swedish, and Danish languages, and became well acquainted with the literature and literary history of the respective nations. Thus the employments of his life as well as his favourite studies had peculiarly qualified him for undertaking, in conjunction with Gruber, the great German '*Universal Encyclopædia of Sciences and Arts*,' which was commenced in 1818, and formed the chief occupation of the remainder of his life. He died at Halle, January 16, 1828.

Ersch's associate in this vast undertaking, JOHANN GOTTFRIED GRUBER, was born November 29, 1774, at Naumburg, in the Prussian province of Saxony. After studying in the gymnasium of his native town, he proceeded in 1792 to the university of Leipzig. In 1803 he became a private tutor in Jena. He afterwards removed to Weimar, where he became acquainted with Wieland, who held him in such esteem that he supplied him with materials for writing his biography. In 1811 he obtained a professorship in the University of Wittenberg. Returning to Leipzig he became a contributor to the '*Conversations Lexikon*,' and published his '*Life of Wieland*,' '*Wieland's Leben*,' 4 vols. 8vo, Leipzig, 1815-16. He also superintended the publication of Wieland's Collected Works, '*Wieland's Sämmtlichen Werken*,' Leipzig, 1818-28, and added to it, in an improved form, his own Life of the poet, which forms vols. 50, 51, 52, 53. In 1815 Gruber was appointed professor of philosophy in the university of Halle, and in 1818 became associated with Ersch in the editorship of the great work so well known to German scholars as Ersch und Gruber's '*Encyclopædie der Wissenschaften und Künste*,' 4to, Leipzig, 1818. This work is divided into three sections, of which not one is yet complete. The first section is to include from letter A to G; the second section is to extend from H to N; the third from O to Z. The 59th part of the first section, published in 1854, ends with George III. of England. The second section was commenced in 1827, and the 30th part, published in 1853, includes the end of letter J. The third section was commenced in 1830, and the 25th part, published in 1850, ends with '*Phyxios*.' Gruber, after Ersch's death, became sole editor of the first section. The editors of the second section are G. Hassel and W. Müller; of the third section are M. H. E. Meier and L. F. Kämtz.

ERSKINE, EBENEZER, founder of a considerable sect of seceders from the established church in Scotland, called the Secession Church, was born on the 22nd of June 1680. He studied in the university of Edinburgh, for some time acted as tutor and chaplain in the family of the Earl of Rothes, and became a licentiate in divinity in 1702. In 1708 he was chosen minister of Portmoak in the shire of Kinross. He became a very popular preacher, and though his charge was in a retired district people flocked from distant parts of Scotland to attend on his ministrations. After having resisted various offers of ministerial appointments in other places, he was prevailed on to accept of a charge in the town of Stirling in 1731, after he had served for twenty-eight years in Portmoak. Mr. Erskine's first difference with his colleagues of the Church of Scotland was in his support of the principles of "the Marrow of Modern Divinity," a subject of great contention during the early part of the 18th century. He was one of several clergymen who, in connection with this subject, were "rebuked and admonished" by the General Assembly. The secession of the body headed by Mr. Erskine was occasioned by the operation of the Act of Queen Anne's reign restoring lay patronage in the Church of Scotland, and, though not in all respects technically the same, it was virtually on the same ground as the late secession of "The Free Church." The presbytery of Kinross, led by Erskine's brother Ralph, had refused to induct a presentee forced on an objecting congregation by the law of patronage. In 1732, the General Assembly enjoined the presbytery to receive the presentee. At the same time they passed an act of Assembly regulating inductions, which, as it tended to enforce the law of patronage, was offensive to Mr. Erskine, and he preached against it. After some discussion the General Assembly decided that he should be "rebuked and admonished," confirming a decision of the inferior ecclesiastical courts. Against this decision

Mr. Erskine entered a "protest," in which he was joined by several of his brethren. He was afterwards suspended from his functions. The Assembly subsequently endeavoured to smooth the way for his restoration, but he declined to take advantage of it, and he and his friends, including his brother Ralph, formally seceded in 1786. When the Secession was divided into the two sects of Burghers and Anti-Burghers, Mr. Erskine and his brother were of the Burgher party. He died on the 22nd of June 1786. The Secession Church, re-united by the junction of the Burghers and Anti-Burghers in 1820, remained a distinct body till 1847, when a union being effected with the Relief Synod (a body which arose from Mr. Gillespie's secession from the established church of Scotland in 1752), the aggregate body assumed the name of the United Presbyterian Church.

RALPH ERSKINE, his brother, was the author of 'Gospel Sonnets,' and other religious works, but his celebrity chiefly rests on his alliance with his brother Ebenezer in the founding of the sect of the Seceders in Scotland. He was born on the 18th of March 1685, became clergyman of the parish of Dunfermline in 1711, and died on the 6th of November 1752.

ERSKINE, JOHN, a writer on law, was born in the year 1695. His father was the honourable John Erskine, son of Lord Cardross, and he was thus the cousin-german of Lord Chancellor Erskine. Erskine's life was that of a recluse student, and was marked by few incidents. In 1719 he became a member of the faculty of advocates, but he does not appear to have had much practice. In 1737, he was appointed professor of Scots Law in the university of Edinburgh. In 1754, he published 'Principles of the Law of Scotland' in 1 vol. 8vo, a work remarkable for its lucid arrangement, and for the terseness and clearness of its exposition of the leading principles of the law. It was destined to be a text-book for his students, but became a leading law authority. It passed through several editions, the last of which was edited in 1827, by Professor More, the present (1856) occupant of Erskine's chair. Erskine retired from his professorship in 1760, and died at his own estate of Cardross in 1765. He had employed his years of retirement in expanding the matter of his 'Principles' into a larger work, which he left behind him nearly finished, and which was published in 1773, in 2 vols. folio, with the title, 'An Institute of the Law of Scotland.' This work has been repeatedly republished with notes, bringing down the law to the dates of the respective editions. It is the great oracle of Scottish law, an authority almost without appeal, and as firmly established as 'Coke upon Littleton' is in England. It is of little value in respect of its constitutional law, which the author seems not to have been capable of observing otherwise than in mere detail. Owing to the increase of commerce and manufactures in Scotland, the portion relating to these subjects is meagre and antiquated. In all things however relating to the rights of persons arising from their relation to each other, and in the peculiar rules of the feudal system in Scotland, the work continues to be of great value, and to be as useful to the practical lawyer as in its profundity of research and clearness of detail it is an object of admiration to the theoretical student.

ERSKINE, JOHN, an ecclesiastical leader, son of the preceding, was born on the 2nd of June 1721. He was licensed as a preacher in 1743, and in 1744 obtained the charge of the parish of Kirkintilloch, near Glasgow. In 1763 he received the degree of D.D. from the university of Glasgow. In 1767 he was appointed one of the ministers of the collegiate church of the Greyfriars in Edinburgh. He had for his colleague Dr. Robertson the historian, who was leader of the moderate party in church politics, or that body which had the least affection for the predominant characteristics of the Presbyterian creed and polity, while Erskine was the leader of the popular Evangelical, or as it was sometimes called Orthodox party—the same which in 1843 seceded from the Church of Scotland, and formed the "Free Church." Erskine was an active popular preacher and leader, and the titles of the books and pamphlets written by him would fill a considerable space. He died on the 19th of January 1803. His memory is still revered by his own party.

(*Account of the Life and Writings of John Erskine*, by Sir Henry Moncrieff Wellwood.)

ERSKINE, THOMAS, LORD, was the third and youngest son of David, earl of Buchan. He was born in 1743, and received the rudiments of his education partly in the high-school of Edinburgh, and partly at the University of St. Andrews. In 1764 he entered the navy as a midshipman, but not thinking his prospects of promotion in that service sufficiently good, he accepted a commission in the first regiment of foot in 1768. In 1770 he married Frances, daughter of Daniel Moore, M.P. for Marlow, and soon after went with his regiment to Minorca. Upon his return to England in 1772, he appears to have become remarkable for the brilliancy of his conversational talents. (Wrexall's 'Memoirs,' vol. i, p. 182, and Boswell's 'Life of Johnson,' under April 6, 1772.) In 1776 he commenced the study of the law, and entered himself a student of Lincoln's Inn, and also as a fellow-commoner of Trinity College, Cambridge, but only for the purpose of obtaining a degree, and thereby saving the additional term of two years, during which his name must otherwise have remained on the books of Lincoln's Inn. He became the pupil of Mr. Buller, and afterwards of Mr. Wood, both of whom were subsequently raised to the Bench. In Trinity term 1778 Mr. Erskine was called to the bar,

where his success was as rapid as it was brilliant. In the same term he was employed as one of the counsel for Captain Baillie, lieutenant-governor of Greenwich Hospital, who was prosecuted for an alleged libel on the other officers of that establishment. The prosecution was in fact instituted by Lord Sandwich, then at the head of the admiralty, who, it appeared, had abused the charity by appointing landmen as pensioners, to serve his own electioneering purposes. Mr. Erskine's eloquent and indignant speech at once established his reputation; such indeed was its instantaneous effect that thirty retainers were presented to him before he left the court. His practice and reputation increased so rapidly that in 1783, when he had been scarcely five years at the bar, he received a patent of precedence at the suggestion of Lord Mansfield, who then presided in the court of King's Bench. In the same year Mr. Erskine was returned member for Portsmouth, through the interest of Mr. Fox, with the immediate view of supporting that minister's famous India Bill. In the House of Commons however his success by no means equalled the expectations which his friends had formed, though his parliamentary speeches would appear to have been far above mediocrity. In the same year also he was made attorney-general to the Prince of Wales, an appointment which he was called upon to resign in 1792, in consequence of his refusing to abandon the defence of Thomas Paine when he was presented for his publication 'The Rights of Man.' In 1802 he was made chancellor of the duchy of Cornwall; and in 1806, on the formation of the Grenville ministry, he was appointed lord chancellor, and raised to the peerage by the title of Baron Erskine, of Restormel Castle, in Cornwall. His tenure of office was however brief, for on the dissolution of the ministry in 1807 he retired from public life. After this period Lord Erskine seldom appeared in his place in the House of Lords, but in 1820 he took a prominent part on the occasion of the trial of Queen Caroline.

In the later years of his life he was harassed by pecuniary embarrassments, arising from the loss of his large professional income, and an unfortunate investment of the fruits of his industry in land. His first wife died in 1805, and an ill-assorted second marriage increased his domestic disquietudes, injured his reputation, and gave pain to his friends. His later years were marked by eccentricities, which seemed to indicate mental disease. He died November 17th, 1823.

Lord Erskine's talents were peculiarly those of an accomplished and dexterous advocate: his eloquence formed an era at the bar, and his addresses to juries captivated their understandings, their imaginations, and their passions; they were not marked by beauty of diction, richness of ornament, or felicity of illustration, but by strength, vigour, and simplicity, and a perfect freedom from colloquial vulgarisms. A remarkable feature in his speeches is an exact and sedulous adherence to some one great principle which he laid down, and to which all his efforts were referrible and subsidiary. As the principle thus proposed was founded on truth and justice, whatever might be his ingenuity in applying it to the particular case, it naturally gave to his address an air of honesty and sincerity which had great influence with the jury. His extraordinary talent was developed by the times in which he lived; his indignant eloquence was called forth in defence of those individuals in whose persons the court and the government attacked the liberty of the press and constitutional freedom. The public mind was in a state of ferment from the recent events of the French revolution; and the government, in their hatred of the great principles of liberty then being established, forgot that actions, not principles, are the proper subjects for prosecution. As counsel for the defendants in these political prosecutions, Lord Erskine made his noblest and most successful efforts; fearless and zealous in the cause of his client, he spoke home truths without using unnecessary violence or low invective.

Lord Erskine has left few productions in writing; the principal are the 'Preface to Fox's Speeches,' the political romance called 'Armata,' and a pamphlet entitled 'View of the Causes and Consequences of the War with France,' which passed through forty-eight editions. His speeches have been published in 5 vols. 8vo. Lord Erskine is not to be considered as a literary man; but with a scanty stock of what is usually called literature, he was one of our purest classical speakers and writers. His study was confined to a few of the greatest models, and these he almost knew by heart. He greatly admired the writings of Burke, and frequently quoted them in his speeches.

ESCOLAPIUS. [ÆSCULAPIUS.]

* ESPARTERO, JOAQUIN BALDOMERO, was born February 27, 1793, at Granátula, a village about six miles south-west from Almagro, in the modern Spanish province of Ciudad Real (old province of La Mancha). His father was a carretero, a maker of carts and similar vehicles, and had nine children, who were all respectfully brought up. Baldomero, being while young of delicate constitution, was destined to literary occupation, and was well instructed in Latin by an ecclesiastic of his native village. In 1806 he was sent to Almagro, which had then a university, in which he studied two years. Having accompanied an elder brother into Andalucía in 1808, he entered as a common soldier the infantry regiment of Ciudad Real, which was then at Seville; but in 1809 he was removed into the Batallón Sagrado of the University of Toledo, which consisted for the most part of students from that city. When the French invaded Andalucía, the central junta took refuge in Cadiz, and this battalion went with it. Soon afterwards a military school was established at Cadiz, into which Espartero obtained

admission, and there studied engineering, fortification, and military tactics generally. In 1814 he was promoted to a sub-lieutenancy in the infantry regiment of the province of Soria, and at the termination of the peninsular war remained with his regiment in garrison at Madrid.

In February 1815 Espartero joined the expedition under General Morillo which was sent out to defend the Spanish provinces in South America against the insurrectionists, of whom Bolívar was the principal leader. The regiment of Estremadura, to which Espartero was attached, was destined for Lima, where it arrived in September 1815. After the first campaign in Peru, Espartero was made captain of a regiment; and having been successful, as he himself states, in seventeen consecutive actions, was appointed to the command of a battalion, January 10, 1817. In 1820 and 1822 he was raised to the rank of colonel and brigadier, and was named chief of the general staff (estado mayor). In 1824 he was sent by the viceroy Laserna with special despatches to the king, and landed in Spain in October. After a short stay he set sail on his return to South America. The passage was long and stormy; and in the meantime the victory of Ayacucho had been gained by Bolívar, December 9, 1824, with irreparable loss to the royalists; and all the Spanish generals had set sail on their return to the Peninsula. Espartero landed at Quilca in May 1825, where, instead of meeting with his old companions in arms, he was seized by Bolívar's troops, thrown into prison at Arequipa, and was treated with such cruelty that his health gave way, and he was transferred to the hospital. At the end of July he made his escape to Quilca, where he was taken on board a French ship, and landed in Spain at the end of November 1825.

After his return to Spain, Espartero was again attached to the regiment of Soria, and while in quarters at Logroño became acquainted with the daughter of a rich proprietor, Doña Jacinta Sicilia, and married her in September 1827. He remained in quarters at Logroño, Pamplona, and Barcelona till November 1832, when he was sent with his regiment to the Balearic Islands. He was stationed at Palma, in Majorca, and continued there till the civil war broke out in the Basque Provinces, in 1833, when he solicited and obtained permission to proceed there with his regiment, in order to act with the queen's troops against those of Don Carlos. He was then colonel of the infantry regiment of Soria. On the 1st of January 1834 he was named Comandante-General of the province of Biscaya, and soon afterwards was raised to the dignity of Field-Marshal. On the 20th of June 1835 he was appointed Lieutenant-General of the National Armies, and on the 17th of September in the same year was named General-in-Chief of the Army of the North. He co-operated with General Evans in the relief of Bilbao and other operations in 1836, and with a body of about 7000 men routed the expeditionary army of Gomez, which had advanced with great rapidity towards Madrid. In 1837 he advanced from the Ebro against the Pretender's army in Castile, which he routed near Aranda de Douro, and interposing between the two columns into which it had separated, drove part of them into the mountains and the rest across the Ebro into the Basque Provinces. When the army of Don Carlos advanced towards Madrid, in 1837, he forced it to retreat, September 12, and drove it back over the Ebro. For seizing the position of Luchana, and by this operation raising the siege of Bilbao, he was created Conde de Luchana. He was active in 1838, but in 1839 the northern provinces, where the rebellion had originated, became tired of the war, and the army of Don Carlos, unpaid, ill fed, and badly clothed, were themselves disposed to join the queen's party. On the 1st of June 1839, Espartero was created a Grandee of the first class, with the title of Duque de la Victoria y de Morella; and on the 31st of August a convention was signed at Vergara between the Duque de la Victoria and Don Rafael Maroto, lieutenant-general of the armies of Don Carlos, by which twenty-four battalions of veteran troops laid down their arms, and acknowledged the supremacy of the queen—"thus," says General Sir De Lacy Evans, "consummating an act of forgiveness, reconciliation, and peace, in a cordial spirit, and under conditions completely honourable to both parties; and which afforded one of the most gratifying and remarkable instances of good sense and good feeling on the part of previously conflicting armies and opposing partisans to be found in the records of any nation." Don Carlos immediately fled into France, and the few troops that remained faithful to him were disbanded and dispersed.

The mother of the Queen of Spain had been appointed Queen Regent during the minority of her daughter, but in consequence of her giving her assent to a law which interfered with the freedom of deliberation in the ayuntamientos, or town councils, an insurrection broke out, which obliged her on the 12th of October 1840 to resign her office of Reina Gobernadora, and retire to France. By a decision of the Cortes, May 8, 1841, Espartero was appointed regent of the kingdom during the remainder of the minority of the queen. He performed the duties of this office till 1843, when a conspiracy and combination of parties obliged him to leave Madrid, and on the 30th of July he was taken on board an English ship of war in the Bay of Cadiz, whence he soon afterwards set sail for England, and fixed his residence in London, where he was treated with the respect to which his services in the cause of constitutional government so well entitled him. The Queen of Spain, by a decree of the Cortes, was declared to have reached her majority on the 8th of November 1843, though

by the terms of the constitution the date was fixed for October 10th 1844. Espartero resided in London till December 29th 1847, when he set sail on his return to Spain. He afterwards lived in retirement at Logroño. Meantime Narvaez had succeeded Espartero as the head of the government; Queen Christina had returned to Madrid; Muñoz her husband had been created Duke of Rianzares; and despotism continued in favour with the court and government till the Spanish people again revolted, and Espartero having been recalled to power, on the 17th of July 1854 the Queen Mother was obliged to quit the kingdom. The Duque de la Victoria continued to be the head of the government till the 14th of July 1856, when, in consequence of a ministerial difficulty, which appears to have been artfully prepared and provided for by O'Donnell, now leader of the absolutist party, Espartero thought fit to tender his resignation. It was accepted by the queen; she appointed O'Donnell as his successor, and the liberal government ceased to exist. The nomination of O'Donnell as prime minister was rejected by the Cortes, consisting of 93 assembled members, with only one dissenting vote. An insurrection broke out in Madrid, which, after some fighting, was overcome; similar risings in Barcelona, San Sebastian, and elsewhere, were speedily suppressed. The whole kingdom however was declared in a state of siege. Saragossa alone seems to be preparing for serious resistance. Espartero is supposed to be under surveillance, if not in custody; but up to the present time (July 24, 1856) his actual state is unknown, at least out of Spain.

(Espartero. *Historia de su Vida Militar y Política, y de los grandes Sucesos Contemporáneos. Escrita bajo la Dirección de D. José Segundo Flores*, 4 vols. 8vo, Madrid, 2nd ed., 1844.)

ESPRONCEDA, JOSÉ DE, a Spanish poet of great popularity and reputation, was born on the high road near Almendralejo in Estremadura, during a march of the campaign of 1810. His father was colonel of the regiment of Bourbon which distinguished itself at the battle of Talavera, and at the age of five, as soon as the child was old enough to mount on horseback, he was entered as a cadet of the regiment. At the conclusion of the war he was sent to school at Madrid, and when at the college of St. Matthew became a favourite pupil of Alberto Lista, the poet and lecturer on literature, who, discovering his talents, encouraged him to compose and corrected his verses. Politics however divided the youth's attention with poetry, and before the age of fifteen he was in prison as a conspirator, as one of the society of 'Numantines,' a secret combination against the despotic rule of the minister Calomarde [CALOMARDE]. On account of his tender age he was allowed to escape with only four months' imprisonment and a short 'reclusion' in a convent, and it was while in the convent at Guadalajara that he commenced an epic poem on the favourite subject of the Spanish writers, 'Pelayo,' the hero of the epic, which a few years later Ruiz de la Vega composed when a refugee in England. On leaving the convent Espronceda made himself again so troublesome, that at the age of seventeen he was obliged to banish himself to Lisbon. When there he was shut up by Don Miguel in the castle of St. George, and one day with several of the other Spanish refugees put on board a ship and sent to England. In the castle of St. George he had become enamoured of a girl of sixteen, the daughter of a fellow-prisoner, a Spanish military officer of rank, and his absence from Portugal was felt as irksome, till one day on witnessing the arrival of a ship in the Thames, he unexpectedly saw her disembark. His residence in England he afterwards looked back upon as the happiest period of his life. He made himself acquainted with the language and studied Shakspeare, Milton, and Byron, especially the last of the three, whom he took in many respects as his model. One of his poems which has been much admired, an 'Ode to Spain on its fallen condition,' is dated from London in 1829. A darkness rests on the conclusion of his love affair, and towards the end of 1829 he was in Paris, where in the following year he fought bravely at the barricades. The success of the revolution of 1830 naturally led the Spanish refugees to try their fortune on their native soil, but the expedition of Pablo de Chapalangarra, in which Espronceda took a part, only gave him an opportunity of displaying his signal courage and of writing a poem on the death of the leader. The change which the exiles had been unable in the least to accelerate, was effected as if by magic by the death of Ferdinand; and Espronceda, who returned to Madrid and entered the regiment of body-guards of the queen, seemed for a short time at the commencement of a career of good fortune. A song which he wrote for a banquet of the regiment soon altered his prospects—it contained some offensive political allusions, which not only led to his dismissal by the ministry, but his banishment to Cuellar, where he occupied himself by writing 'Sancho Saldaña y el Castellano de Cuellar,' an historical novel in the style of Walter Scott. On the promulgation of the 'Estatuto Real,' the constitutional charter of modern Spain, he returned to Madrid, and took part in the newspaper 'El Siglo,' or 'The Age.' At this time his political sentiments were not only of a republican but a socialist character, and he was so ready to carry them into action, that twice in the years 1835 and 1836 he was engaged in defending barricades in the streets of Madrid. His friends, who continued so to the last, make it no secret that at the same time his private life was one of disorder and excess. At length in 1840, after some years of struggle, varied with occasional flights from the reach of the authorities, he

was fortunate enough to take part in a successful 'pronunciamento,' or outbreak, in the September of that year, and in 1841, as a reward, was named secretary of embassy at the Hague. He travelled to his post in the depth of winter, and found his health so affected in consequence, that he was obliged to return soon after to Spain, where he was highly gratified by being chosen representative of Almería, and thus becoming a member of the Cortes, long an object of his ambition. In the midst of bright anticipations he was suddenly carried off on the 23rd of May 1842 by an inflammation in the throat, in the thirty-second year of his age, and his death produced a strong and sad impression.

The works of Espronceda consist of a single volume of 'Poesias,' and of the historical novel already mentioned, which was published at Madrid in 1834 in six small volumes, the whole of which would be easily comprised in a single volume of an English 'Railway Library.' The poems were printed at Madrid in 1840 during the author's absence by his friend Villalta, who in the preface calls him "the great Spanish poet of the present epoch," and appeals to "the enthusiasm which the sublime compositions of the 'Pirate,' the 'Beggar,' the 'Executioner,' the 'Hymn to the Sun,' and others excited" in all classes of Spanish society, when circulated in manuscript, as a proof of the justice of his estimate. Other Spanish critics, and one English writer, Mr. Kennedy, author of the 'Modern Poets and Poetry of Spain,' have concurred in the same view. Espronceda certainly deserves the credit of having been one of the first to introduce into Spanish literature some forms of poetical composition, which in other parts of Europe have been invented or adopted by men of high genius, but his originality is for Spaniards only, and it may be doubted if his high reputation is likely to be durable. The 'Pirate,' which is of the same class precisely as 'The Sea, the Sea,' of Barry Cornwall, will hardly sustain a comparison with its English rival. It may be said indeed that the Spanish language, rich, grave, and sonorous, is sometimes from those very qualities singularly unadapted for the expression of those brief and abrupt bursts of passion which form some of the brightest ornaments of the English poetical treasury. Perhaps the finest short poem by Espronceda is 'The Night of the Condemned to Death,' in which, like Victor Hugo, he aims at delineating the feelings of a criminal the night before execution. This with some of his other poems has been translated by Mr. Kennedy. An extensive fragment of a long poem, 'The Devil World,' was first published in a second edition of Espronceda's poems issued after his death by Hartzenbusch in 1843, with a biographical notice by Ferrer del Rio.

ESSEX, EARLS OF. **WALTER DEVEREUX**, first earl of Essex, the son of Sir Richard Devereux and Dorothy, daughter of George, earl of Huntingdon, was born in Caermarthenshire, at the castle of his grandfather, Walter Viscount Hereford, about the year 1540. He succeeded to the titles of Viscount Hereford and Lord Ferrers of Chartley in his nineteenth year, and was early married to Lettice, daughter of Sir Francis Knolles. When the rebellion, headed by the earls of Northumberland and Westmorland, broke out in 1569, he raised a considerable body of troops, and, in conjunction with other forces, compelled the rebels to retreat into Scotland. The courage that he displayed during this warfare recommended him to Queen Elizabeth, who had ever esteemed his loyalty and superior intelligence: in gratitude for the service that he had rendered her, she conferred on him the order of the Garter, and created him Earl of Essex (1572). He now became so great a favourite with the queen, that Leicester and others about the court, jealous of his increasing influence, encouraged Essex to enter upon a scheme for subduing and colonising a district of the province of Ulster. He had for some time contemplated such an expedition, and having been persuaded to take the command, embarked from Liverpool in August 1573, in company with Lord Darcy, Lord Rich, and other persons of distinction. He contracted to furnish one-half of the expense of the undertaking, in consideration of which he was to have one-half of the colony as soon as it was established. His arms at the outset met with various success; but after a time his English friends deserted him, and their loss, together with the enmity of many courtiers at home, soon multiplied difficulties round him. He was obliged to resume the government of Ulster, which he had previously resigned; and he was compelled to make peace with O'Neill when his pursuit of the rebels under that leader gave every prospect of success. He was required to give up his command when he had nearly dispossessed the Scots, who had invaded the western islands in his territory, and with no other title than that of captain was made to serve at the head of a small body of 300 men. Feeling himself harassed and oppressed, he returned to England; but having received, with the title of Earl Marshal of Ireland, promises that he should have greater liberty of action allowed him if he would go back to that country, he consented to return to his post. The improvement of his situation however was so small that his spirits were affected; the effects of grief were soon visible in his constitution; a dysentery attacked him, and, after a month's pain and misery, he died at Dublin, on the 22nd of September 1576: his body was removed for interment to the parish church at Caermarthen. The sudden failure of his health gave rise to a suspicion of his having been poisoned; but no evidence whatever could be adduced to prove the fact. The speedy marriage of the Countess

of Essex to Leicester, who was suspected of being a party to the murder of her late husband, did not tend to throw discredit on the report. Essex left two sons and two daughters. Of the sons we subjoin a further account. Of the daughters, Penelope (the Stella of Sir Philip Sidney) first married Robert Lord Rich, afterwards Charles Blount, earl of Devonshire; and Dorothy married first Sir Thomas Perrot, and afterwards Henry Percy, earl of Northumberland.

ROBERT DEVEREUX, EARL OF ESSEX, the son of the preceding, was born at Netherwood, in Herefordshire, in November 1567, and was educated, according to his father's wish, under the superintendence of Lord Burleigh, by whose direction he was sent to Trinity College, Cambridge, in 1577, and remained there four years. Upon leaving the university, he retired for some time to his estate in South Wales, and did not appear at court till 1584. His station, his agreeable manners, handsome person, and vigorous mind soon brought him into notice. He was reconciled to Leicester, now his father-in-law; and received the appointment of Master of the Horse from the hands of the queen, who also made him a Knight of the Garter. Elizabeth at the same time remitted the debt to the exchequer incurred by his father; and when Leicester went with an army into the Netherlands in 1587, she gave to Essex, who accompanied him, the responsible commission of a captain-general of the cavalry. On the death of Leicester in 1588, Essex became her chief favourite. In 1589 he suddenly joined the expedition of Drake and Norris, who had undertaken to restore Antonio to the throne of Portugal. The queen, exasperated at his departure from court without licence, despatched the Earl of Huntingdon to Plymouth with a peremptory order for his return. The messenger was too late; Essex had sailed. He joined the expedition on the coast of Portugal, marched to Lisbon as a volunteer, behaved himself throughout the enterprise with great gallantry and humanity, and on his return to England found that, in spite of his disobedience, he retained beyond all comparison the first place in the queen's favour. His chief rivals in her esteem were Sir Walter Raleigh, whose removal from court by the means of an appointment in Ireland had been attributed to the contrivance of Essex, and Sir Charles Blount, of whom he was so jealous, that upon the queen's bestowing a trifling mark of favour upon him at a tilting-match, Essex used such insulting expressions to him that a duel ensued, in which the earl was wounded in the knee. In 1590 he married a daughter of Sir Francis Walsingham, the widow of Sir Philip Sidney, and in the following year was despatched to assist Henry IV. of France in his resistance of the King of Spain, who sought to obtain possession of the duchy of Brittany. He encamped under Rouen, and here, as at Lisbon, idly challenged the governor to a duel. The expedition was wholly unsuccessful, and the earl lost, by a musket-shot, his only brother Walter Devereux, to whom he was greatly attached.

In 1594, Essex, who had once before come into collision with the Cecils respecting the appointment of the queen's secretary, became a second time at variance with them. Having, as he conceived, discovered a plot in which Lopez and others had resolved to murder the queen, he apprised her Majesty of his suspicions; but Lord Burleigh and Sir Robert Cecil, who, at the queen's desire, had examined into the case, declared the accusation to be unfounded, so that the queen severely rebuked Essex. Mortified both at this rebuke and at the conduct of his rivals, he renewed the inquiry, and eventually elicited evidence upon which Lopez and his confederates were executed. The opposition of the Cecils to the counsels of the Earl of Essex was renewed in 1596. Lord Howard, then lord admiral, advised the queen again to invade Spain, a proposal which Essex warmly seconded; Burleigh, on the contrary, denounced the scheme as impolitic and imprudent. The queen gave her consent to the expedition: Howard and Essex sailed; Cadiz was taken, plundered, and burned; fifty-seven Spanish ships of war and merchantmen were taken or destroyed; and the Spanish government suffered considerable loss. But though the enterprise was successful, and commanded with the greatest gallantry, the benefits resulting to the English government were hardly equivalent to the expense incurred. After some trifling attacks upon the coast of Spain, the fleet, which had been absent little more than two months, returned to England. The enemies of Essex had endeavoured during his absence to poison the mind of the queen to his prejudice, but his publication of the 'Censure of the Omissions in the Expedition to Cadiz' completely reinstated him in her favour. He continued to meet with disappointments in his endeavour to obtain official situations for his friends, but was himself created Master of the Ordnance. In July 1597, Essex, as commander-in-chief, with Lord Thomas Howard as vice-admiral, and Sir Walter Raleigh as rear-admiral, sailed against the Spanish fleet, with a view also of making conquests among the Azores. The English ships, shattered and crippled by a storm, were immediately driven back to Plymouth. In August they again set sail, and though they could not burn the Spanish ships which they now found in harbour, they succeeded in making captures to the amount of 100,000*l.*, with which booty they returned to England in November. The queen received Essex with reproaches and discontent, and the expedition was generally deemed a failure. He now retired to Wanstead, angry on several accounts: the chief of these was the elevation of the lord admiral to the earldom of Nottingham, by which he thought himself doubly

affronted; first, because Lord Howard's services at Cadiz were recited, and, in the second place, because by his new title Lord Howard gained precedence of him according to a regulation made in the reign of Henry VIII. He was pacified by being appointed hereditary earl marshal, which by the same regulation restored him to his rank. In 1598 a quarrel occurred between the queen and Essex, who, having differed from her respecting an Irish appointment, angrily and contemptuously turned his back upon her in the presence of several of the ministers. The queen, unable to bear the affront, gave him a box on the ear, and bade him "go and be hanged." Essex immediately seized his sword, and the lord admiral stepping in between, he swore "that he neither could nor would put up with an affront of that nature, nor would he have taken it at the hands of Henry the Eighth himself." He withdrew from the court, and some months passed before he would make any submission. His friends dated his ruin from this unfortunate circumstance. It was hastened by the death of Burleigh, which was on the whole a great misfortune to Essex. Had Burleigh lived Essex might not have undertaken the unfortunate Irish expedition on which he at this time entered (1599). The province of Ulster was in a state of rebellion; and with the hope that his rank and military popularity might prevail in that country, he accepted the commission of lord lieutenant of Ireland. His government in that country was inconsiderate and ill-advised; and his opposition to the queen's wishes in the nomination of Lord Southampton to the generalship of the horse, which he was peremptorily ordered to revoke, gave great offence. His delay in sending troops to Ulster, the loss of men and money consequent on the delay, and the ultimate failure of the expedition, were the causes of many and loud reproaches. Essex returned to England in September: at their first interview the queen received him in a friendly manner, but on the following day he was put into "free custody," and detained a prisoner in his house. In June 1600 he was denied the privileges and authority of his office; and it was not until the 26th of August that he was liberated. The queen still denied him access to court, and refused the renewal of a valuable patent for the monopoly of sweet wines, which his friends used all their endeavours to procure, declaring that "in order to manage an ungovernable beast, he must be stinted in his provender."

The weight of these grievances upon his haughty and impetuous mind told the more heavily from the knowledge that his general popularity was undiminished. So deep was his impression of resentment against those whom he conceived to have biased the queen against him, that he listened to the rash and desperate advice of Cuffe, his secretary, to remove Cecil, Cobham, and Raleigh by force from the queen's councils. In order to strengthen his interest, the gates of Essex House were with almost inconceivable imprudence thrown open to all persons who professed to be discontented with the queen or her advisers. With the same view, he courted both the Roman Catholics and Puritans, and a concourse met daily to hear sermons in his house. The multitude that attended the delivery of these discourses could not fail to attract the attention of the vigilant government. Essex was warned to be careful of his safety, and his attendance was required before the council. At this summons he took alarm, fearing a renewal of his imprisonment, and consequently the defeat of his scheme. He determined therefore to commence his proceedings on the following morning (Sunday, February 8, 1600-1); and during the night messengers were sent in all directions to acquaint Essex's friends that his life was threatened by Raleigh and Lord Cobham. In consequence of this intelligence, Lords Sandys and Montague, the earls of Rutland and Southampton, with nearly three hundred other gentlemen, assembled at Essex House, where it was divulged that Essex had resolved at once to rid himself of his enemies by forcing his way to the queen, and informing her of his danger from those who had so long abused their influence with her majesty. Essex having shut up within his gates the lord keeper, the chief justice, and others whom the queen, aware of what was passing, had sent to inquire into the cause of the tumult, proceeded with his friends to the city, where, crying "For the queen, for the queen, a plot is laid against my life," he tried to enlist the citizens in his favour. But, as might have been anticipated, notwithstanding his popularity, not one man was found mad enough to take up arms. At length the earl endeavoured to return home, but a party of soldiers met him at Ludgate, and a skirmish ensued, in which he was twice shot through the hat. He however reached Essex House, but after a short defence he was compelled to surrender himself, and with Lord Southampton was committed to the Tower: the rest of the conspirators were lodged in various other prisons. He was tried for treason in Westminster Hall on the 19th of February, condemned, and executed the 25th of the same month. ('Criminal Trials,' vol. i.) Essex was undoubtedly a brave and high-spirited man, and with many brilliant qualities possessed an ardent and susceptible mind, and was naturally disposed to the admiration of all that is great and beautiful. Towards his friends he was amiable, to his inferiors and dependents frank, generous, and considerate; but all his good qualities were rendered useless to his country and dangerous to his friends by his overweening vanity and ambition, and his utter disregard of common prudence, and even common sense, in carrying his purely personal objects.

He left one son (of whom we give an account below) and two daughters. Frances married first the Earl of Hertford, and after-

wards the Duke of Somerset. Dorothy was the wife first of Sir Henry Shirley, and lastly of William Stafford, of Blatherwyck, in Northamptonshire.

ROBERT DEVEREUX, third Earl of Essex, was born in Essex House, in the Strand, in 1592. He was sent to Eton by his grandmother, who, after his father's death, received him into her house; and in 1602 he was removed to Merton College, Oxford, where the warden, Mr. (afterwards Sir Henry) Savile, who had been an intimate friend of his father, took charge of his education. He was restored to his hereditary honours in 1603, and three years afterwards was unhappily married to lady Frances Howard, a child of no more than thirteen years old. The new-married couple being too young to live together, Essex was sent to improve himself abroad; while the bride, who was celebrated for her beauty, continued with her mother. It was four years before he returned to claim his wife, and in the meantime she had contracted so great an affection for Lord Rochester, afterwards Earl of Somerset, that, until she was compelled by her father, she could not be brought to cohabit with her husband. The union never was a happy one. Not many months after they had met, she instituted proceedings against him praying for a separation on a real or pretended charge of physical disability. A divorce was granted, and the lady was soon after married to Lord Rochester. The slur thus cast upon Essex drove him to the retirement of his country-house and the pursuit of rural occupations. After some years however, a solitary life became irksome to him. Tired of inaction, he joined Lord Oxford in 1620, raised a troop, and marched with the Elector Palatine in the war against Holland. In the winter he returned to England, where his opposition to the government rendered him unpopular at court; indeed the reception that he met with at home was so little agreeable that he willingly renewed his military avocations abroad during the two following summers; and in 1625 again raised a troop, with which he sailed to aid the United Provinces. His disposition and capability for military service now struck the king, and he was appointed vice-admiral of a fleet which was employed in a fruitless expedition against Spain. He engaged in another expedition in the Low Countries, and was afterwards bold enough to marry a second time. In this second choice of a wife (the daughter of Sir William Paulet) he was scarcely more fortunate than in his first. It is true indeed that the lady soon after her marriage bore a son, which Essex owned and christened after his name, but her familiarities with Mr. Uvedale gave him cause to suspect her fidelity, and after much mutual crimination, on the one side for inconstancy, on the other, a renewal of former charges, a separation took place. The child died at the age of five, and Essex never showed further inclination to matrimony.

Between his journey to Ireland in 1632 and his appointment in the fleet that sailed to Holland in 1635, Lord Essex spent his time either in his house at Chartley or in London. His inclination to seek popularity among the Presbyterians was evident and undisguised; nevertheless the king employed him as lieutenant-general of his troops that were sent against the Covenanters (1639). In 1640 he was one of twelve peers that signed a petition that a parliament should be called and an attempt made to settle the difficulties of the state without further bloodshed. He was also one of the commissioners sent to Ripon to treat with the Scots; and when, at the opening of the Long Parliament, the king saw that it was necessary that he should endeavour to conciliate the Presbyterian party, he made Essex lord chamberlain. It was the wish of many of the royalists that Essex, whose popularity was great among the Presbyterians, should also have been placed at the head of the army; but Charles, who disliked him on account of the roughness of his manner, and doubted the firmness of his attachment to him, refused to appoint him, and would yield to their requests no further than to make him lieutenant-general of his forces south of the Trent. When the Commons demanded of the king that a guard should be raised in the city of London, it was Essex whom they desired to have placed at its head. Charles, unwilling to listen to this request, left London suddenly, and called upon Essex to follow him; but Essex, indisposed to the king on account of the incivility with which he had always been treated at court, refused to follow, pleading his duty to remain in attendance of parliament. Vehemently angry at this refusal, the king instantly deprived him of all his offices. Essex now became the chief favourite and leader of the parliamentary or presbyterian party. He became parliamentary general in 1642, and was in consequence proclaimed a traitor by the king. He opposed Charles in person at Edgehill (1642); he also took Reading (1643); but on account of a disease with which his troops were infected he was obliged to abandon any further attack, at which the disappointment of the parliamentary leaders was so great that they nearly dismissed him from his command. On the recovery and reinforcement of his soldiers he triumphantly entered Gloucester, from which he had driven the king away, surprised Cirencester, and after fighting courageously at the doubtful battle of Newbury, succeeded in covering London. As the supporters of the parliament were supposed to be numerous in Cornwall, in the hope of increasing his forces he marched to that county pursued by the royalist troops: the number of adherents however had been exaggerated, his expectations were disappointed, and as he was completely hemmed in by his pursuers, the scarcity of provisions began to be severely felt. At this crisis the king proposed a treaty, but Essex had no authority to make any agreement without

the sanction of his parliamentary masters; and as the royalists, finding that he did not comply with the king's offer, continued to press their advantage, after some of his troops had abandoned him, he was obliged to escape by sea from Fowey. Having sailed from Plymouth to London, he once more collected an army, and was placed at its head, but an illness compelled him to quit his command.

When he returned to London, Essex found a state of confusion and distrust that scarcely could be expected. At a meeting held at his house it was proposed to impeach Cromwell, but this served no other purpose than to irritate that leader. The independents soon afterwards succeeded in carrying the 'self-denying ordinance,' which forbade members of either house of parliament to hold any command in the army; thus Essex ceased to be parliamentary general. It was voted that for his services he should be raised to the rank of a duke, and be granted a pension of 10,000*l.* a year. He did not however live to enjoy these honours, being carried off by a sudden and violent illness in the fifty-fifth year of his age. He was publicly interred in Westminster Abbey.

The chief defects in the character of the Earl of Essex were indecision and vacillation; when he erred, it was more from want of judgment than from bad intention. His bearing was always manly, and his courage has never been impeached. At his death the title became extinct.

ESSEX, JAMES, the first professional man in the 18th century who made Gothic architecture his study and practice, was the son of a carpenter in good business at Cambridge, where he was born in 1723. Educated in the school of King's College, the unrivalled chapel became the object of his admiration, and finally impressed him with the powers and beauties of a style which was then neither valued nor understood. Except his own eyes and his own diligence, he had nothing to assist or direct him in the study of it—nothing to give him even the slightest insight into its principles. Greatly therefore is it to his credit that his own judgment and perseverance enabled him to attain the knowledge of it, and to do in it what he did, instead of being led astray like Batty Langley, who had about that time just published his 'Gothic Architecture Improved by Rules and Proportions.' In 1757 Essex was employed by Bentham to make drawings for his work on Ely Cathedral, and from him he acquired much information relative to the history of Gothic architecture and its leading styles; and of that cathedral itself he altered the choir in 1770, and conducted extensive repairs in other parts for many years afterwards. He was also engaged in repairing Lincoln minster, where he erected a stone altar-piece of his own designing. Besides various alterations at several of the colleges at Cambridge, he executed some repairs at King's College Chapel, and designed some stone-screens. Among his other works was a monumental cross at Amplehill in memory of Catherine of Aragon, and improvements in the ancient mansion at Maddingley, Cambridgeshire, the seat of Sir John Hinde Cotton. He also published designs for new buildings at King's, Benet (Corpus Christi), and Emmanuel colleges, and for a new Public Library at Cambridge. His reputation as an antiquary was considerable, and he was acquainted with most of those who were noted for their attachment to similar studies—Gray the poet, Horace Walpole, Gough, Tyson, Cole of Melton, and others. Besides being a member of the Society of Antiquaries, he contributed some papers to their 'Archæologia,' namely, 'Remarks on the Antiquity of different Modes of Brick and Stone Buildings in England,' vol. iv.; 'Observations on Lincoln Cathedral,' vol. iv.; 'On the Origin and Antiquity of Round Churches,' vol. vi. He died at Cambridge of a paralytic stroke, September 14th, 1784.

ESTE, HOUSE OF. One of the oldest historical families of modern Europe, and the oldest among those which have retained sovereign power to the present time, the house of Savoy perhaps excepted. Some chronologists, such as Pigna, have endeavoured to trace back the genealogy of the house of Este to the 5th century of our era, when we find the names of Atius, Aurelius, and Tiberius mentioned as princes of Este, Vicenza, and Feltra. But to pretend to ascertain the lineal succession of these princes down to the 9th century is a matter at least very dubious. The more sober and judicious Muratori, in his 'Antichità Estensi,' has traced the ancestry of the Este to the dukes and marquises who governed Tuscany as a great imperial fief under the Carolingian emperors, and who were probably, like most other great Italian feudatories at that time, of Longobard origin. Some old chroniclers, such as Mario Equicola, in his 'History of Mantua,' state positively that they were Longobards, and related to the Longobard dukes of Spoleto. The succession however of these marquises or dukes, among whom are registered two of the name of Adalbert, in the 9th century, is not clearly ascertained until we come to another Adalbert, who is styled marquis, but of whom little is known, and who died about 917. He left however two sons, Guido and Lambert, who were stripped of their fiefs by Hugo and Lotharius, kings of Italy. A son or nephew of either Guido or Lambert, named Oberto, took the part of Berengarius II., who was elected king of Italy about 950; and this Oberto was possessed, either by inheritance or through the favour of Berengarius, of several fiefs in Tuscany and Lunigiana. Being afterwards dissatisfied with the conduct of Berengarius, he was one of the Italian nobles who repaired to Otto of Saxony to offer him the crown of Italy. Otto, on his

exaltation, appointed Oberto 'comes sacri palatii,' which was one of the first dignities of the kingdom, and gave him in marriage his daughter Alda. Oberto died about the year 972, leaving two sons, Adalbert and Oberto II., the latter of whom was lord of Lunigiana and of the county of Obertengo in Tuscany. Oberto took the part of Hardouin, marquis of Ivrea, against Henry of Bavaria, for the crown of Italy. Oberto died about 1014, and was succeeded by his son, Alberto Azzo I., who in his turn was succeeded by his son Alberto Azzo, or Albertazzo II. This Albertazzo, besides his paternal fiefs of Lunigiana and Tuscany, inherited also from his uncle Ugo the fiefs of Este, Rovigo, and Casalmaggiore, in Lombardy. In the year 1045 he was appointed by the emperor Henry III. count and governor of Milan; and soon after he married Kunita, or Cunegonda, of the great German house of Welf, and sister to Welf III., on whom the Emperor Henry had bestowed the duchy of Carinthia and the march of Verona. Welf III., dying without issue, his inheritance fell to his sister's eldest son by Albertazzo, who took the name of Welf IV. This Welf IV. was made duke of Bavaria about 1070, and from him the line of Brunswick and Hanover, known also by the name of Este-Guelphs, is descended.

Albertazzo having lost his German wife, married Garisenda, countess of Maine in France, by whom he had two sons, Folco and Hugo. To Folco he left his Italian estates, and Hugo inherited the French property of his mother, namely, the county of Maine, which he afterwards sold. Hugo married a daughter of Robert Guiscard, the conqueror of Naples, and died without issue. Muratori transcribes a diploma of the emperor Henry IV., dated 1077, confirming the possessions of the Italian fiefs to Hugo and Folco, sons of the Marquis Azzo of Este. Folco, after his father's death, was sued by his half-brother Welf for a share of his paternal inheritance; but after a long contention, an arrangement was made by which Folco retained the greater part of the Italian estates, including the fief of Este. Folco died in 1135, and his son Obizzo succeeded him. Like his father, he assumed the title of marquis of Este, from the town of that name, by which his house was designated ever after. The town of Este, built near the ruins of the ancient Ateste, lies in the Venetian state, north of the Adige, in the province of Padua. The Emperor Frederic Barbarossa, at a court held at Verona in 1184, bestowed upon Obizzo the investiture of the marquises of Milan and Genoa, which were then however merely nominal, as the two cities had become free.

In Obizzo's time the foundation of the dominion of the house of Este over Ferrara was first laid. The family of Adelardi had long been the popular leaders at Ferrara, and enjoyed the chief authority in that community. Marchesella, the last offspring of this family, was betrothed by her uncle and guardian Guglielmo on his death-bed to one of the Torelli, a rival family; but the girl was carried away and compelled to marry Azzo of Este, the son of Obizzo, and from that time the Este were considered as citizens of Ferrara. "A veil has been thrown over the whole transaction, which seems to imply that fraud or violence had been committed." (Litta, 'Famiglie celebri Italiane'.) This Azzo, styled the Fifth, died about the end of the 12th century, and was succeeded by his son Azzo VI., who was elected in 1208 by the citizens of Ferrara as vicar or lord of that city, with power to appoint his successor. "This," says Litta, "was the first example of a free Italian city giving itself over to a lord, and the beginning of those numerous principalities into which Italy became divided."

Aldobrandino succeeded his father Azzo VI. in 1212, and was himself succeeded by Azzo VII., called also Azzo Novello, who took part with the pope against Frederic II.; for the Este were naturally of the Guelph party. He was mainly instrumental in the fall of the tyrant Ezzelino: he favoured learning, patronised the Provençal troubadours who resorted to his court at Ferrara, and established schools in that city. He was succeeded by Rinaldo, and the latter by Obizzo in 1252. Obizzo was elected lord of Modena in 1288, and of Reggio in the following year, according to the prevailing fashion of the Italian cities at that period. These lordships of Ferrara, Modena, and Reggio however were not held by the Este in undisturbed possession, for they were repeatedly invaded and recovered during the frequent wars of the Italian states in the 14th century. While the family of Este were acquiring a princely dominion, they lost the original fief from which they derived their name. About 1293 the Paduans took possession of the town and territory of Este by conquest, and annexed it to their community. It afterwards, in 1405, passed into the hands of the Venetians.

Nicholas, called 'the Lame,' one of the successors of Obizzo, was vicar of Ferrara from 1377 to 1389: he fought for the pope against Bernabé Visconti, duke of Milan. He was succeeded in 1389 by his brother Albert, and Albert by another Nicholas, who died in 1440, leaving two illegitimate sons yet in their infancy, and several natural sons grown up, to one of whom, Lionel, he bequeathed his dominions. Lionel proved a good prince: he restored the university of Ferrara, and after nine years of a mild and liberal administration he died in 1460, leaving the government of the state to his brother Borso, who was illegitimate like himself. Borso was one of the most distinguished princes of his age. He was a patron of arts and letters, and was generous, enlightened, and just. He recalled his two legitimate brothers, Ercole and Sigismondo, from Naples, treated them with

brotherly affection, and, in order to secure the succession to them after his death, he abstained from marrying. In 1452 Borsò received from the emperor Frederic III. the titles of Duke of Modena and Reggio and Count of Rovigo; and in 1471 Pope Paul II. gave him the title of Duke of Ferrara, upon which town the Roman see claimed a right of patronage. Borsò died soon after, leaving a large and prosperous state to his brother Ercole.

His successor Ercole I. was likewise a man of considerable talents and a patron of literature. He was also remarkable for that wary and cautious policy which has been stigmatised as peculiarly Italian, but which was in reality indispensable to the Italian princes in order to protect themselves from the overbearing violence of foreign invaders, after Ludovico Sforza through ambition committed the suicidal act of calling the French into Italy. Ercole checked the fury of Louis XII., who, after he had driven the Sforzas from Milan, was bent on exterminating all the other Italian princes. Ercole was fond of travelling: he visited the various Italian courts, and encouraged tournaments, festivals, and hunting parties. He gave the first theatrical entertainments exhibited at Ferrara, where the *Menachmi* of Plautus was performed in 1486. His court was frequented by Bojardo, Collenuccio, Tibaldeo, Guarino of Verona, and other learned men of his time. He caused many Greek manuscripts to be translated, and had a Hebrew press established at Ferrara in 1476.

Alfonso I., son of Ercole, succeeded him in 1505. He married the daughter of Pope Alexander VI. [*BORGIA, LUCREZIA.*] Alfonso had a long and troubled reign. He was attacked by Julius II. and the Venetians; he lost Modena and Reggio, and the Venetians also threatened Ferrara. The death of Julius afforded him some respite. Leo X. continued to withhold Reggio and Modena from him, and made also an attempt to surprise Ferrara. Alfonso displayed considerable abilities and great perseverance. He and his brother, Cardinal Ippolito, the patron of Ariosto, often took the field in person: their artillery was the best served in Europe; and they defeated the Venetians. After the death of Leo X., Alfonso, who had till then sided with the French, made his peace with Charles V., who by an imperial decree dated 21st April 1531, confirmed the rights of the house of Este over Modena, Reggio, and Rubiera, upon the duke paying him 150,000 sequins; and thus Alfonso was restored to the possession of those states. Alfonso died in 1534 and was succeeded by Ercole II., and the latter by Alfonso II., who is unfavourably known by the misfortunes of Tasso, which however the poet in a great measure brought upon himself. [*TASSO.*] Alfonso II. dying in October 1597, without issue, Pope Clement VIII. immediately sent Cardinal Aldobrandino with troops to take possession of Ferrara as having devolved to the see of Rome, which had first invested Borsò with the title of Duke. Cesare d'Este, Alfonso's cousin and heir, entrusted Lucrezia, Alfonso's sister, with full power to negotiate. Lucrezia, who had hated the Marquis of Montecchio, son of Alfonso I. and father to Cesare, on account of the share he had taken in the transactions of 1575 relative to Tasso, disliked Cesare also. Cardinal Aldobrandino having offered her the title and revenues of Duchess of Bertinoro in the Romagna, she signed a hasty convention, by which she gave up in the name of the house of Este, Ferrara, Comacchio, and their dependencies, to the see of Rome. Cesare transferred his court to Modena, and Lucrezia died at Ferrara a few days after the entrance of the Papal troops, in February 1598. The city of Ferrara, which, under the house of Este, had a population of 60,000 inhabitants, gradually became reduced to 20,000.

Cesare, duke of Modena and Reggio, died in 1628. His son Alfonso III., who had remained as hostage at Ferrara, had shown in his youth marks of a violent disposition. In 1619 he caused Ercole Popoli to be assassinated at Ferrara. Stung by remorse, he abdicated the ducal throne soon after his father's death, and became a Franciscan monk. He distinguished himself as a zealous preacher, and founded several convents. He died in 1644, in a convent which he had founded in the mountains of Garfagnana. His son Francis I. affected a great zeal for religion, had his food scrupulously weighed on fast days, and he sentenced a relative of Marshal Gassion to be shot for want of proper respect while at church. He first separated the Jews from the rest of the population at Modena in 1630, and confined them to the Ghetto. He began the magnificent ducal palace at Modena as well as the country residence and gardens at Sassuolo. His successor, Alfonso IV., received in 1660 of the emperor Leopold the investiture of the principality of Correggio, which he had previously purchased. Alfonso loved the fine arts, and he was the founder of the Este gallery of paintings. He left at his death a son two years old, who was afterwards duke by the name of Francis II. During his minority his mother, Laura Martinuzzi, Cardinal Mazarin's niece, held the government. She collected together all the bad characters in her dominions, and delivered them over to the Venetians, who employed them in the war of Candia against the Turks. Francis II. founded the university of Modena, as well as the splendid library called Estense, of which Zaccaria, Muratori, and Tiraboschi were successively librarians. Francis II. dying in 1694 without issue, was succeeded by his uncle, Cardinal Rinaldo, who, after resigning his hat, married a daughter of the Duke of Brunswick Lunenburg, and sister-in-law to the emperor Joseph I. By this marriage the two branches of Este and Brunswick which had been separated since 1070, became again connected.

During the war of the Spanish succession, the Duke Rinaldo, notwithstanding his professed neutrality, was obliged by the French to quit Modena and to take shelter at Rome. The victorious Austrians, commanded by Prince Eugene of Savoy, restored him to his dominions, where he resided quietly till 1733, when the war for the succession to the crown of Poland, in which Italy had no concern whatever, but for which Italy was as usual devastated by the belligerents, obliged Rinaldo again to leave his territories, which became the battle-field between the French and Piedmontese on one side, and the Austrians on the other. In 1736 Rinaldo returned to Modena. His repeated misfortunes affected and perhaps improved his disposition: he became serious and economical after having been inclined to pomp and magnificence. He enlarged his dominions by the purchase of the duchy of Mirandola and the county of Bagnolo. Rinaldo was succeeded in 1537 by his son Francis III., who was serving in Hungary against the Turks at the time. During the war of the Austrian succession he took part for the house of Bourbon, and commanded the Spanish armies in Italy. The peace of Aix-la-Chapelle restored him to the quiet possession of his dominions. In 1754 Duke Francis was appointed by Maria Theresa governor of Lombardy during the minority of her son the Archduke Ferdinand, who was betrothed to the Duke's granddaughter Beatrice d'Este, a child then four years old. In 1771 Francis gave up his trust to the Archduke Ferdinand, but continued to reside in Lombardy, and died at Varese in 1780. His son Ercole Rinaldo, the father of Beatrice, succeeded him as duke of Modena. His administration was peaceful and economical. He was ever watchful against the temporal interference of the court of Rome in his dominions; and he was equally averse to the remains of feudality which still lingered in his states. When the French entered Italy in 1796, the duke made a convention with Bonaparte, paid a heavy contribution, gave up some valuable paintings, but not trusting to the faith of the conqueror, he withdrew to Venice with his treasures, leaving a council of regency at Modena. An insurrection excited at Reggio by some Corsican soldiers in the French service afforded a pretext to Bonaparte to violate the convention, and to occupy the states of Modena, which were afterwards annexed to the Cisalpine republic. (Botta, *'Storia d'Italia'*; Paridisi, *'Lettere a Carlo Botta'*.) When in the following year the French occupied Venice, the duke had escaped to Trieste, but a deposit of 200,000 sequins which he had left behind was seized. Ercole Rinaldo died in the Austrian States in 1803. His daughter Maria Beatrice, the last offspring of the house of Este, lost her husband, the Archduke Ferdinand of Austria, in the year 1800, and their eldest son, Francis IV., was restored by the peace of Paris in 1814 to the dominions of his maternal ancestors, namely, the duchy of Modena, Reggio, and their dependencies, including the district of Garfagnana, on the borders of Lucca. By the death of his mother he also inherited the duchy of Massa and Carrara, of which his grandmother, of the house of Cibo Malaspina, was the heiress. He died January 21, 1846, and was succeeded in all his titles and possessions by his son Francis V.

ESTHER was the orphan cousin and adopted daughter of Mordecai, descended from a Benjamite family of the Babylonian captives of Nebuchadnezzar (Esther, ii. 6-7). The place of her residence was in the city Shusan, or Susa, now Sus (not Shuster, as stated by Dr. Adam Clarke—see *'Trans. Geog. Soc.'*, vol. iii.), which, throughout the book, is in English mistranslated 'Shushan the palace,' though, in the Septuagint version, it is rightly *ἐν Σούσαις τῇ πόλει*, that is, 'in Susa the city.' The monarch, Ahasuerus (chap. i.), after having entertained all his nobles and princes with sumptuous festivity during more than six months, gave a great feast in his palace-garden to all the men of Susa, great and small, while the women were separately feasted by the queen in the royal house. To the men royal wine was supplied in abundance, and the drinking was according to every man's pleasure; when the king, being on the seventh day merry with wine, sent his seven chamberlains with orders to bring the queen to exhibit herself before his guests; but Vashti (which in Persian means the beautifully fair) refusing to come (the command was improper), he was very wroth, and his anger burned within him. Ahasuerus however punished her by degradation and banishment, and by his royal mandate letters were despatched to the people of each province, decreeing that every man bear rule in his own house. To furnish the royal harem with the greatest means of choice, there was made throughout the empire (ch. ii.) a general levy of the fairest virgins; and Esther, the beautiful young Jewess, being preferred by Hago, the keeper of the king's women, before all others of the numerous assemblage, she succeeded to the place of the banished queen Vashti. The twelve months' cosmetical purification of the maidens previous to their admission to the king (ver. 12) was required, says Dr. Clarke, "to show if they were with child, that the monarch might not be imposed on by fathering a spurious offspring; and because many having been brought up in low life, and fed on coarse, strong, and indigestible food, they had a copious and strongly-odorous perspiration, which was far from pleasant." Esther's foster-father, Mordecai the Jew (chap. iii.), having refused to do reverence to Haman, the chief minister and favourite of Ahasuerus, he, with all the other Jews from Babylon then dispersed throughout the Persian empire, were by Haman devoted to destruction, and the royal mandate being accordingly issued "to destroy, to kill, and to cause to perish all Jews, young and old, little children and

women, in one day, and to take the spoil of them for a prey (ver. 13), the king and Haman sat down to drink;" but the fickle tyrant, influenced in the meantime by the pathetic entreaties of Esther, and by the recollection that Mordecai had discovered a conspiracy against his life, was induced to hang his favourite Haman on a gallows thirty yards high, which that minister had prepared for Mordecai. He then promoted Mordecai to the highest honours in the empire; and still yielding to the influence of the fair Jewess and of Mordecai, he hastily issued orders empowering all the Jews "to destroy, to slay, and to cause to perish all the people that would assault them, both little ones and women, in one day, throughout all the provinces of King Ahasuerus, and to take the spoil of them for a prey" (viii. 11, 12), so that "the Jews smote all their enemies with the sword, with slaughter and destruction, and did what they would unto those that hated them" (chap. ix. 5). By the special request of Esther, the ten sons of Haman were hanged on the gallows, and in the city of Susa the Jews massacred 800 of the king's Persian subjects, and in the provinces 75,000 (ix. 12, 13, 15, 16). This signal revenge of Haman's intended destruction of the Jews in Persia has ever since been commemorated (ix. 21-28) on the 14th and 15th days of the month Adar, in the Jewish 'Feast of Purim,' that is, in Persian, 'the lots,' with reference to those which were cast before Haman (chap. iii. 7; ix. 26). The word which in the authorized version is repeatedly translated 'gallows,' should properly be 'cross,' or tree. Hence it was that in the first ages of Christianity the Jews, when celebrating this feast of Purim, were accused of deriding the Christian crucifixion, in abusing and setting fire to an effigy of Haman affixed to a lofty wooden cross—a custom which on this account was abolished in the Roman empire by the decrees of Justinian and Theodosius.

The book of Esther is a canonical book, and though placed after that of Nehemiah, comes chronologically between the sixth and seventh chapters of the book of Ezra. Various opinions have been held as to who was the writer of it. Augustin, Epiphanius, and Ildore supposed the author to have been Ezra. Eusebius assigns a later date. Some writers have attributed it to the high-priest Joachim; others believe it to have been composed by the Jewish synagogues, to whom Esther and Mordecai wrote (ix. 20-29); but by the greater number Mordecai himself is thought to be the author, and Elias Levita, in his 'Mam. Hamum,' asserts this to be a fact unquestionable. The original, according to Dr. Adam Clarke, was probably written in the language of ancient Persia. The most likely opinion, that of Horne, is that, with some explanations and adaptations, it was extracted from the Persian annals, possibly by Ezra, Nehemiah, or Mordecai, which would account for its peculiarities. St. Hieronymus and several other fathers regarded this book as wholly uncanonical, because the name of God or religion is not once mentioned or alluded to, and they have been followed by some modern writers, as Cajetan and De Lyra; but the Council of Trent pronounced it to be wholly canonical; and while the Protestant churches admit into the canon only what is found in the Hebrew copies, that is, as far as to the end of the third verse of chapter x., the Greek and Roman churches use as canonical the Greek version and Latin Vulgate, which contain each ten more verses of chapter x. and six additional chapters. By the Jews the book has been always considered as one of the most precious of their sacred scriptures, and as a perfectly authentic history of real events which took place about B.C. 519. They call it 'Megilah,' that is, 'The Volume,' and hold it in the highest estimation; believing that whatever destruction may happen to the other scriptures, Esther and the Pentateuch will always be preserved by a particular Providence. Copies exist in the Hebrew, Syriac, Chaldaic, Greek, and Latin; each of which widely differs from the others, and all, especially the Greek and Chaldaic, are greatly different from the Hebrew. The Chaldaic text contains five times more than the Hebrew, and a notice of the various readings would fill a large volume. Commentators differ much in determining to which of the Persian and Median kings belongs the name of Ahasuerus, whose kingdom extended from India to Ethiopia over 127 provinces (i. 1). Some suppose him to be Darius Hystaspes. Scaliger and Jahn say Xerxes. By Capellus he is identified with Oehus, and by Archbishop Usher with Darius the son of Hystaspes. Dean Prideaux and Dr. Adam Clarke with greater probability take him to be Artaxerxes, who received the cognomen of Longimanus, or Longhanded.

ESTIENNE. [STEPHENS.]

ETHELBALD, King of Wessex, was the eldest surviving son of Ethelwulf, who reigned to him the throne of that state in 855 or 856. [ETHELWULF.] On the death of Ethelwulf in 857 or 858, Ethelbald married his young stepmother, Judith of France; but the vehement remonstrances of Swithin, bishop of Winchester, prevailed upon him, after some time, to abandon the incestuous connection. Judith afterwards became the wife of Baldwin, count of Flanders, and the ancestress of Matilda, the wife of William the Conqueror, and, through her, of all the succeeding kings of England. The chroniclers speak in very favourable terms of the subsequent conduct of Ethelbald; but although he had greatly distinguished himself in the wars with the Danes in his father's time, his own reign is not marked by any military events. He died in 860, and was succeeded by his next brother, Ethelbert.

ETHELBERT, or, as the name is written by Bede, AEDILBERT, is described as the fourth king of Kent in lineal descent from Hengist,

through Eric or Aesc, Ocha or Oehtha, and Ermeric, whom he succeeded while yet a child in the year 560. As the representative of the first leader of the Anglo-Saxons and the founder of the oldest kingdom of the Heptarchy, Ethelbert, as soon as he attained manhood, engaged in a contest for the title of Bretwalda with Coawlin, king of Wessex, who claimed that supreme dignity as the grandson of Cordia. He invaded Wessex in 568, but the war was speedily ended by his defeat in a great battle fought at Wibbandune, now Wimbledon, in Surrey. This was the first instance of one of the states of the Heptarchy drawing the sword against another. Ethelbert however, according to Bede, came to be acknowledged as Bretwalda about the year 589, after the decline of the fortunes of Coawlin, who was deposed about this time by his subjects, and died a few years after. Ethelbert retained the supremacy during all the remainder of his reign, though it would seem that his title never was acknowledged by the kings of Northumberland.

The most memorable event in the reign of Ethelbert was his conversion to Christianity, and the establishment of that religion in his dominions by the ministration of St. Augustin. [AUGUSTIN, ST.] Ethelbert professed himself a Christian, and was baptised on the feast of Pentecost, 597. The Christian worship however must have been familiar to him long before this time, for he had been married to a Christian wife, Bertha, the daughter of Charibert, king of Paris, in the year 570, and she and her attendants had continued to practise their own religion under the guidance of Liudhard, a bishop who had accompanied her from France. After his conversion, Ethelbert exerted himself with zeal in the diffusion of his new faith. He founded the bishopric of Rochester about the year 604 in his own dominions, in addition to the archbishopric of Canterbury, the establishment of which is dated from the arrival of Augustin. To him also must be principally attributed the foundation, about the same time with that of Rochester, of the bishopric of London, in the state of Essex, which was at that time governed in subordination to Kent by Sebert, Sæebryht, or Saba, a nephew of Ethelbert. Bede says that the cathedral of London, which was dedicated, like the others that have since been built on the same site, to St. Paul, was erected at the joint expense of Ethelbert and Sebert. The conversion of the king and people of Essex had previously been effected through the influence of the king of Kent. It was also through his daughter Edilberga, who married Edwin, king of Northumbria, that Christianity was introduced into that state. [EDWIN.]

Ethelbert deserves especial remembrance in English history on another account. He is the author of the earliest of our written laws, the collection of 'Dooms,' as Bede calls them, "which he established with the consent of his Witan in the days of St. Augustin." They are written in Saxon, or English, as it is termed by Bede, although all the other Teutonic nations employed the Latin language in their codes; and they are the earliest laws that exist in any barbarous or modern tongue. There is no reason however to suppose that the regulations which they established were in general new. They relate, to quote the words of Sir F. Palgrave ('Eng. Com.,' p. 44), "only to the amount of the pecuniary fines payable for various transgressions, the offences against the church being first enumerated. These were of new introduction; but every other mulct was known before; and it is probable that the principal benefit of the law consisted in a fairer apportionment of the compensation to the crime than could be obtained according to the older customs." The collection consists altogether of eighty-nine enactments or clauses; at least as it has come down to modern times. But the only copy of it which we possess is that contained in the volume called the 'Textus Roffensis,' which was compiled by Ernulfus, bishop of Rochester, in the early part of the 12th century; and "it is difficult to believe," as Sir F. Palgrave has observed, "that the text of an Anglo-Norman manuscript of the 12th century exhibits an unaltered specimen of the Anglo-Saxon of the reign of Ethelbert. The language has evidently been modernised and corrupted by successive transcriptions. Some passages are quite unintelligible. . . . Neither is there any proof whatever of the integrity of the text. It cannot be asserted with any degree of confidence that we have the whole of the law. Destitute of any statutory clause or enactment, it is from the title or rubric alone that we learn the name of the legislator." The next oldest Anglo-Saxon laws that have been preserved (those of Hlothære and Eadric, also kings of Kent) are more than a century and a half later than Ethelbert.

Ethelbert died in 616. He appears in his old age to have married a second wife, but her name has not been recorded. All that we know of her is, that after the death of Ethelbert, her youth and beauty were sufficient to tempt his son and successor, Eadwald, to take her to his bed, and of course to renounce at the same time the profession of Christianity. After a short time however Eadwald dismissed his stepmother, and returned to the faith he had abandoned, of which he ever after continued a firm supporter.

ETHELBERT, King of Wessex, was the second surviving son of Ethelwulf, by whom he was made king of the subordinate state composed of Kent, Essex, Sussex, and Surrey in 852, on the death of Athelstan. [ETHELWULF.] On the death of his elder brother Ethelbald, in 860, although excluded by his father's will from the succession to the supreme crown of Wessex, he was preferred by the Witan to his younger brother Ethelred, who claimed under the will. The chronicles celebrate the courage and military talents of Ethelbert:

but no events of his short reign are distinctly recorded. It appears however that the Northmen continued to make occasional descents both on the coasts of Wessex, and on those of other parts of the island. All that we are told of Ethelbert is, that he died in 865 or 866. He appears to have left a son, Ethelwald, and other children; but he was succeeded on the throne of Wessex by his younger brother Ethelred.

ETHELRED I. (called also Edelred and Ethered), King of Wessex and head of the Heptarchy, was the third surviving son of King Ethelwulf, who in his will (ratified by the Witan) appointed Ethelred to succeed to the throne immediately after his eldest brother Ethelbald; he did not however succeed till after the death of his elder brother Ethelbert in 866. [ETHELWULF and ETHELBERT of Wessex.] The reign of Ethelred was eminently disastrous both for Wessex and for the other states of England. In the last year of the preceding king, the great Danish chief, Ragnar Lodbrog, had been taken prisoner while making an attack on Northumbria, and put to death with cruel tortures. It appears to have been with the purpose of avenging this loss that the various Scandinavian nations immediately united their strength in that great expedition against England, which terminated in the conquest of half the country. The invaders, to the number of several thousands, under the command of Ingvar (or Ivar) and Ubbo (or Hubba) landed on the coast of East Anglia, immediately after the accession of Ethelred to the throne of Wessex. Having encamped and passed the winter on shore, they marched into Yorkshire in the spring of 867, took possession (1st of March) of the city of York, and having there (12th of April) repulsed with great slaughter an attack of the Northumbrians under Osbert and Ella, made themselves masters of all the kingdom of Northumbria to the south of the Tyne, and placed Ingvar over it as king. They then marched into the kingdom of Mercia, and passed the winter of 867-8 in the town of Nottingham. Beorhted, the Mercian king, now solicited the aid of Ethelred; and the King of Wessex, accompanied by his younger brother Alfred, whom he appears to have admitted to a share of the royal power, advanced with an army against the foreigners. The Danes however did not venture to engage the allied forces of Wessex and Mercia; and a treaty was made by which they agreed to evacuate Nottingham and to retire to York. In that city they remained quiet for the remainder of this year, and all the next, during which England was afflicted by a severe famine, followed by a terrible mortality both of human beings and cattle. But, in the spring of 870, disregarding the late pacification, the Danes resumed hostilities, carrying their arms across the Humber into Lincolnshire, which was included in the dominions of Mercia. Notwithstanding some attempts to check their progress, which were made by Earl Algar, the governor of the district, they speedily overran all Lincoln, and pushed their way into the adjoining territory of East Anglia, sacking and destroying in their course the abbey of Croyland and Medehamstead (or Peterborough), the town of Huntingdon, and the nunnery of Ely, and massacring and laying waste wherever they appeared with unheard-of ferocity. At a village called Hoxton, in Norfolk, they seized Edmund, the East Anglian king, and put him to death: he sustained the torments they inflicted upon him with such constancy that he was afterwards revered as a martyr, and the 20th of November, the day on which he met his fate, was assigned to him in the calendar. His death made the Danes masters of East Anglia, over which they placed Godrun, one of their chiefs, as king. They now resolved to invade Wessex, the only state which they had not either conquered or rendered powerless. They entered Berkshire, under the command of Halden and Bacseg, and took the town of Reading without encountering any resistance; but they were soon after attacked by Earl Ethelwulf at the neighbouring village of Inglefield, and driven from their ground with the loss of Sidnor, one of their most renowned captains. Four days after they were fallen upon at Reading by King Ethelred and his brother Alfred; but on this occasion the Saxons were repulsed with great loss, the brave Earl Ethelwulf being among the slain. The battle of Reading however was followed in four days more by another more important encounter at a place which the old writers call Aescodun, or the Ash-tree Hill, and which has been supposed by some to be Ashhamstead in the west, by others Ashton in the east, of Berkshire. The Danes were here attacked with great impetuosity and valour by Alfred, and, notwithstanding their advantageous position, were, after a struggle of some length, completely defeated and put to flight. It is said that the English chased them for the whole of the night and next day over the country till they reached the town of Reading, in which they again shut themselves up. But a fortnight after the battle of Ash-tree Hill they again met the two kings of Wessex at Basing, in the north of Hampshire, and this time the English were worsted. A similar result attended the next battle, fought, about two months after, at a place called Merton, which has been variously conjectured to be places named Merton in Surrey, Oxfordshire, Wilts, and Berkshire. In this engagement, which must have taken place early in 871, Ethelred received a wound, of which he died soon after Easter, leaving the now almost shadowy inheritance of the crown of Wessex, and what would at a later period have been called the suzerainty of England, to his younger brother Alfred.

ETHELRED II., surnamed the Unready, King of the Anglo-Saxons, was the youngest son of King Edgar, by his second wife, the infamous

Elfrida. On the murder by Elfrida of his elder brother, Edward the Martyr, in 978, he was reluctantly acknowledged as king by the Witan, in the absence of any other individual having pretensions to the crown; even Dunstan, who had steadily opposed the party of Elfrida throughout the late reign, finding himself now obliged to acquiesce in the accession of her son. He was crowned by Dunstan at Kingston-on-the-Thames on the 14th of April, being at this time only a boy of ten years old; but the haughty prelate is stated by Malmesbury to have declared as he placed the crown on the boy's head that the sins of his mother and her accomplices should be visited on the head of her son, and that in his reign such evils should befall the English as they had never yet suffered since they came into Britain. The curse thus solemnly denounced by the chief priest and leading statesman in the kingdom, no doubt did something towards working out its own accomplishment. Certain it is that the reign of Ethelred the Unready is on the whole the most calamitous and disgraceful in English history. The feeble and distracted government that arose out of his minority, the circumstances of his accession, and the unpatriotic conduct of Dunstan, immediately drew once more upon England the attention of the northern piratical powers, who had now remitted their attacks for nearly a century. A small body of Danes landed at Southampton in 980; and scarcely a year passed afterwards in which one part or other of the coast was not in like manner visited and ravaged, usually with impunity. At length, in 991, a much larger force than had before appeared arrived under two leaders named Justin and Gurthmund, and after taking the town of Ipswich, proceeded to Maldon, and there encountering the English army commanded by the alderman Brithnod, obtained a complete victory, Brithnod himself being slain. On this it was resolved by the English Witan, on the advice, it is said, of Siric, who had succeeded Dunstan as the king's chief counsellor, to buy off the invaders with a sum of money. They agreed to accept 10,000 pounds of silver, which was accordingly paid to them, being raised by an impost on all the landed property in the kingdom, which from this time became a regular tax, under the name of the Danegeld, and was perhaps the first direct tax imposed in England. It was felt however that this was a very precarious expedient to trust to; and as soon as the Danes were gone, the government proceeded to fit out a formidable fleet, which might perhaps have been of service if it had been ready to meet them when they arrived. As it was, it was no sooner afloat than it was rendered useless by treachery and mismanagement. A squadron of Danes having again appeared on the coast in 992, Alfre, the commander of the English fleet, when sent to surprise them, secretly gave them information of the intended attack, and then went over and joined them. The next year, when the Northmen made a descent upon the coast of Northumberland and took by storm the castle of Bamborough, the leaders of the force sent against them in like manner deserted to the enemy. In 994 a much more powerful armament than had yet appeared sailed up the Thames under the command of Sweyn or Svein, king of Denmark, and Olave king of Norway; it consisted of ninety-four ships, and directed its first efforts against London, which however defended itself successfully against the assault. The invaders then overran and laid waste a great part of Essex, Kent, Sussex, and Hampshire. In the end they were again bought off by the payment of a sum of money, their demand this time rising to 16,000 pounds of silver. Olave now consented to embrace Christianity; and he faithfully kept his promise of never again molesting England. Not so the king of Denmark; his forces continued their attacks year after year; and at last, in 1001, Ethelred found himself once more compelled to rid himself of them by his old expedient. He was now obliged to pay them 24,000 pounds of silver.

For what length of time the relief which he thus purchased might have lasted it is impossible to say. Ethelred now resorted to another mode of dealing with the evil, which was of a very different character from that to which he had hitherto adhered, but combined the qualities of being at once still more unjustifiable and still less likely to prove efficacious. On the 13th of November (the festival of St. Brice) in the year 1002, the English inhabitants, in obedience, it is said, to secret instructions received in every city from the government the evening before, suddenly rose in all parts of the kingdom upon the Danes who were resident among them, and put them to death—men, women, and children. There has been some dispute as to the precise extent to which the massacre was carried, and it cannot be supposed to have comprehended all the persons of Danish descent resident in the country, for in many districts it is certain that the majority of the inhabitants were of this description; but there can be no doubt that a very large number of persons perished. This atrocious and in every way unwise proceeding did not long remain without its fit punishment. The next year Sweyn, whose sister, married to an English earl, had been among the butchered, again appeared on the south coast; and from this time it may be said the kingdom had no rest. After the devastations of the invaders had been continued for four years, they were once more bought off in 1007 by a payment of 36,000 pounds of silver. The next year, by extraordinary efforts a numerous fleet was built, and assembled at Sandwich; but a dispute arising among the captains, one of them deserted with twenty vessels, and turned pirate, and nearly all the rest were soon after destroyed by a tempest. Meanwhile, all the other forms of public calamity combined to afflict

the nation. The king was an object of general hatred or contempt; the nobility were divided into hostile factions; and famines and contagious diseases vied with the swords of the invaders in destroying the miserable people. In 1009 a new Danish force arrived, under a leader named Thurkil, who for the three following years spread devastation throughout the only part of the country that had hitherto afforded an asylum from the foreigners—the fens of East Anglia. At last, after he had sacked and burned the city of Canterbury, Thurkil was bought off in 1012 by a payment of 48,000 pounds of silver, and he and his followers agreed, on being allowed to settle in the country, to become the subjects of the English king. But the next year Sweyn himself again made his appearance, now avowing his determination not to depart till he had effected the conquest of the country. Entering the Humber, he received the submission both of the Northumbrians and of the parts of Lincoln that were in like manner chiefly inhabited by a population of Danish descent. He then marched across the country to London, putting all the males to the sword as he advanced; but the capital, which was defended by Ethelred and Thurkil, resisting his assault, he turned to the west, and, compelling the nobles to make their submission to him wherever he passed, he proceeded to Bath, and there caused himself to be proclaimed king of England. Soon after this London submitted to his authority; and in the middle of January 1014 Ethelred fled to the court of Richard, duke of Normandy, whose sister Emma he had married some years before. He had previously sent thither Emma and her two children.

On the 2nd of February however Sweyn died. His son Canute was immediately proclaimed king by the army; but the English determined to recall Ethelred. He was brought back accordingly, after entering into a solemn agreement with the Witan, that he would be a good lord to them, and amend all they wished to have amended, and that all things should be forgiven which had been done or said against him, they on their parts promising that they would all turn to him without fraud, and would never again permit the Danes to have dominion in England. Canute deemed it prudent to take flight before the national enthusiasm of the moment; and it is said that another general massacre of the Danes that were left behind in the country signalled the restoration of a national government. But Canute returned the following year with a powerful fleet; he was immediately joined by Thurkil, who till now had remained faithful to his English allegiance; other chiefs followed Thurkil's example, and a great part of the country appears to have again speedily submitted to the Danes. Ethelred was confined to his bed by illness when Canute arrived, and he died in London on the 23rd of April 1016, at the moment when the enemy was preparing to attack that city. He was succeeded by Edmund, surnamed Ironside, his eldest son by a lady named Elgiva or Elfeda, who is said to have borne him six sons and four daughters, but to whom it has been doubted whether he was ever married. Edward, one of his two sons by Emma of Normandy, whom he married in 1002, also afterwards ascended the throne. [EDMUND IRONSIDE; EDWARD THE CONFESSOR.]

ETHELWULF was the son of Egbert, whom he succeeded in the throne of Wessex and the supremacy over the other states of the Heptarchy, in 836. The provinces of Kent, Essex, and Sussex, which Egbert had conquered and annexed to his dominions, and also that of Surrey, which had hitherto been included in Wessex, were at the same time formed into a separate but subordinate kingdom, and put under the government of Athelstane, his eldest son. There is no older authority than that of Malmesbury (whose account is indisputably incorrect in several particulars and improbable in others) for the story that Ethelwulf was a monk at the time of his father's death. His early education is recorded to have been conducted first by Helmstan, bishop of Winchester, and afterwards by Swithin, whom, on coming to the throne, he advanced to the same see; and he had also served with distinction in the field in the lifetime of his father. When he succeeded to the crown he retained as his chief counsellor the able Alatan, bishop of Sherborne, who had been in great favour with Egbert. What has been preserved of the history of the first fourteen or fifteen years of the reign of Ethelwulf consists almost exclusively of the detail of a series of contests with the Danes, who now continued with incessant perseverance those descents upon the English coasts which they had commenced in the preceding reign. In 837 three squadrons of them made attacks on different points nearly at the same time. The next year they landed again in great strength in Lincolnshire, and, after defeating the troops sent to oppose them, marched across and ravaged the country down to the Thames. In 839 three hard battles are recorded to have been fought at Rochester, Canterbury, and London, besides an action at sea, near Charmouth, in which the English fleet, commanded by Ethelwulf in person, sustained a defeat. For some years after this however the Northmen, abandoning Britain, directed all their efforts against the coasts of France. But in the latter part of the year 850 a body of them landed in the Isle of Thanet, when, so ill-prepared was Ethelwulf for the attack, that the foreigners were enabled for the first time to pass the winter in the country. In the spring of 851 they were joined by great numbers of their countrymen, and the whole multitude ascending the Thames in a fleet of 350 vessels, plundered Canterbury and London. They then penetrated into Surrey; but here they were met by Ethelwulf at Okeley, and after a long and obstinate battle, were defeated with immense loss. They were soon after worsted

in another battle at Wenbury, in Devonshire, and also in a sea-fight near Sandwich by Athelstane, the king of Kent. The consequence was, that the Danes did not again make any attempt on England during the reign of Ethelwulf.

In 852, on the death of Athelstane, the kingdom of Kent was assigned by Ethelwulf to his second son, Ethelbert, he himself retaining the chief sovereignty as before. The following year, at the request of Beohred, or Burchred, king of Mercia, he led an army against the Welsh, and marched through their country as far as the Isle of Anglesey, compelling them to acknowledge themselves the subjects of himself and Beohred. On the termination of this expedition he gave his daughter Ethelwitha in marriage to the king of Mercia. In 855 he undertook a journey to Rome, accompanied by his youngest son Alfred, who had been also carried to that city in the preceding year by bishop Swithin. On his return through France, Ethelwulf married Judith, daughter of Charles the Bald, king of that country, although she had not yet reached her twelfth year. Meanwhile however his eldest son Ethelbald, taking advantage of his father's absence (whom perhaps he represented as being in his dotage), had entered into a scheme for seizing the throne. It is said that among his accomplices was the prime minister Alatan, and that he was also supported by the chief nobility, from which we may conjecture that the attempted revolution was not without some strong reasons in its favour. And although the return of Ethelwulf is said to have prevented the full success of the design, it was substantially carried into effect. It was agreed at a solemn meeting of the Witan that Ethelbald should become king of Wessex, and that Ethelwulf should reign as sovereign, with Ethelbert under him, in Kent and the other eastern provinces. It may be supposed that in his new position Ethelwulf enjoyed little more than a nominal authority. He spent the remainder of his days mostly in exercises of devotion, and died in 857 or 858. By his will, which was confirmed by the Witan, he left the kingdom of Kent to his second son Ethelbert, and that of Wessex in succession to his other sons, Ethelbald, Ethelred, and Alfred.

One of the legislative acts of the reign of Ethelwulf has given rise to much discussion, namely, the grant which he made in 854 or 855, with the consent of the Witan, in favour of the church, and which was wont to be considered as the original foundation of the right of the clergy to the tithes; but this position is abandoned by recent authorities: it appears rather to be intended, as Turner thinks, as "a liberation of the land which the clergy had before been in possession of from all the services and payments to which the Anglo-Saxon lands were generally liable, or that it was an additional gift of land, not of tithes, either of the king's private patrimony, or of some other which is not explained." Palgrave contends that it was a grant of the tenth part of the land by metes and bounds, to be held free from all secular services; yet he admits that the interpretation which construes the grant into an enfranchisement of all the lands which the church then possessed, is "not altogether void of probability." ('Eng. Com.,' p. 159.)

ETHEREGE, sometimes written ETHERIDGE, SIR GEORGE, born about 1636, was a distinguished wit and dramatic writer of the reign of Charles II. According to the usual routine of a gentleman's education at that time, he studied law at an inn of court and travelled. In 1664 he made his first public appearance as author of the comedy called 'Love in a Tub.' 'She Would if She Could' followed in 1668, and 'The Man of Mode, or Sir Fopling Flutter,' in 1670. All these were received with much favour by the public. They placed him, with Buckingham, Rochester, Sedley, &c., in the first rank of the wits of the day. Ease and liveliness of dialect are their characteristic excellence; but they have an ingrained taint of licentiousness running through the whole conception as well as the language, which has long excluded them from the stage. If the characters are supposed (which is the author's best excuse) to be but highly-coloured copies of the fine gentlemen and ladies of the day, we shall marvel that the name and estimation of gentlemen should ever have been sullied by such a total want of truth and honour. Sir George Etherege's verses are not numerous, and consist of occasional pieces, lampoons, songs, and short amatory poems, some of which are of a grossly licentious character. Etherege's private life may be guessed from his writings: play injured his fortune, debauchery his constitution. He repaired the former by marrying a rich widow, whose price was a title; and to win her he purchased his knighthood. He was in James II.'s household, and was afterwards employed by that king as minister to Ratisbon, where, by one account, he died from a fall down stairs after a convivial entertainment; but, according to another account, he followed James II. to France. His death seems to have occurred about or soon after the Revolution of 1688. There is an edition of his Plays and Poems in 8vo, London, 1704, and one in 12mo, London, 1715.

ETHICUS, or ÆTHICUS, is conjectured to have lived about the 4th century of our era, and is the reputed author of a 'Cosmography,' or short description of the world, being an enumeration of the seas, islands, mountains, provinces, cities, and towns of the then known world, with a short account of the sources and course of the principal rivers. In speaking of the Tiber's course through Rome, he mentions the gate of St. Peter, that of St. Paul, and the Via Portuensis, or of 'the martyr St. Felix.' He also speaks of Rome as the mistress of the world, of the games held by the Romans, of the prefectus urbis,

&c. These circumstances may serve to fix the time of the compilation of the work towards the end of the 4th century, when Rome had become completely Christian, but yet before Alaric's invasion. Æthicus and his 'Cosmography' are mentioned by several writers of the following ages, and among others by Isidorus of Seville, who lived in the early part of the 7th century. Rabanus Maurus ('de Inventione Linguarum'), a writer of the 9th century, calls Æthicus "a Scythian;" and Flodoardus, a writer of the following century, calls him "Ister" from "Istria." (Vossius, 'de Historicis Latinis,' b. iii.) At the beginning of his 'Cosmography,' Æthicus states that Julius Cæsar, during his consulship with M. Antony, by virtue of a *senatus consultum*, ordered a survey of the Roman world to be taken, and that the work was entrusted to three geometers—Zenodorus for the eastern part, Polycleitus for the south, and Theodotus for the north—who completed their work under Augustus. This survey was probably the source from which the Antonine Itinerary was derived, which Itinerary in its present shape has also been attributed by some to Æthicus. The 'Cosmography' in most publications is followed by another and somewhat fuller description of the various parts and provinces of the world, apparently of the same period, entitled '*Alia totius Orbis Descriptio*,' and generally attributed to Æthicus also, though there are doubts concerning his authorship. The second work is also found almost literally in Orosius, forming the second chapter of his history. It has been suggested that Orosius may have copied it from Æthicus, and the text of Orosius has certainly the appearance of a copy, as he has shortened the beginning or introductory part, and also left out the concluding sentence, in which the author of the description, as we have it separately, promises to give a continuation of his work, or an ampler description of the towns, &c., beginning from Rome, which he styles "Caput Mundi et Domina Senatus." (Simler's edition of Æthicus, Basil, 1576.) This last sentence promising a fuller account the author did not fulfil, or the account has been lost. But it is also worthy of remark, that in two manuscripts of Orosius in the national library at Paris, Nos. 4878 and 4882, the second chapter ends with these words, which are not found in the other manuscripts and printed editions of Orosius—"Percensui breviter ut potui provincias et insulas Orbis Universi, quas Solinus ita descripsit." This would seem to attribute the work to Solinus.

To the two Cosmographies attributed to Æthicus is added, in some editions, another extract, which is styled "Julii Honorii Oratoris Excerpta quæ ad Cosmographiam pertinent." It is in its plan similar to the first Cosmography of Æthicus, only perhaps still drier and more incorrect. The three have been published, together with 'Pomponius Mela,' by Gronovius, Leyden, 1635.

ETIENNE. (STEPHENS.)

ETTY, WILLIAM, R.A., was born at York, March 10, 1787. His father rented a mill in the vicinity, and kept a baker's shop in the city; and the boy assisted in the shop till he was of age to be put to learn a trade. He had already shown a marked fondness for drawing, and his mother, as in after-life the great painter was fond of relating, had encouraged his propensity, while neighbours used to 'patronise' the incipient artist with halfpence and pennies to buy chalk and pencils. In his twelfth year he was apprenticed to a printer at Hull, in which situation, over-worked, without friends and distant from his family, and denied the privilege of drawing, he appears to have at first led a very uncomfortable life. But after awhile his master was persuaded to let the boy "at lawful hours" indulge his artistic tastes, and, though still without instruction, Etty soon began to acquire sufficient facility in drawing to make his companions in the printing-office desirous to possess, and some of them careful to preserve, his sketches and rude attempts at painting. At length, his seven years' apprenticeship having expired, he gladly obeyed the invitation of an uncle to come up to London. His uncle, himself a skilful draughtsman, saw promise in the youth's crude efforts, and generously afforded him the means of practically solving the question whether his inclination for the life of a painter was an impulse merely, or the result of a native aptitude.

At first, without any formal instruction, he drew, as he says in his 'Autobiographical Sketch,' "from prints, or from nature, or from anything he could; . . . his first academy being a plaster-cast shop, kept by Gianelli, near Smithfield." Having thus sufficiently mastered the difficulties of drawing "from the round," he obtained an introduction to Fuseli, then keeper of the Royal Academy, and was admitted by him to study there as a probationer. He entered as a student in January 1807, along with Collins, from whose companionship in study, with that of Hilton and Haydon, he derived considerable benefit. In the following July Etty became an in-door pupil for twelve months to Sir Thomas Lawrence, then in the height of his reputation—Etty's uncle kindly paying the hundred guineas required as a premium. From the great portrait painter Etty received little direct instruction; he however saw him paint, and though at first the extreme facility of the master's execution almost overwhelmed the pupil with despair, he gradually learnt this very important part of a painter's craft—"the great key to art," as he calls it; and he found, when he could copy Lawrence's pictures, that those of other painters, including the great painters of Italy, presented comparatively few difficulties. Etty laboured with untiring diligence in the school of the Royal Academy, and in copying at the British Institution and elsewhere, whilst pre-

paring his earliest original works for the Academy Exhibition; but though his copies met with purchasers, and his original efforts with praise, it was long before he could find an opportunity to bring any of his works before the public. Year after year all the pictures he sent were returned from both the Royal Academy and the British Gallery. He applied in his despondency for advice to his old master. "Lawrence," he says, "told me the truth in no flattering terms; he said I had a very good eye for colour, but that I was lamentably deficient in all other respects almost." Etty took the reproof in good part, worked day and night, "and with such energy, to cure his radical defects, that at last a better state of things began to dawn." He had the delight to find one of his pictures, a 'Telemachus Rescuing Antiope,' admitted to a place on the walls of the Royal Academy in 1811. But the place was a bad one, and the picture attracted no notice. However he went on, and at each succeeding exhibition of the Academy and the British Institution some of his paintings found a place. His subjects, with the exception of a few portraits, were mostly classical, though not of the kind by which he ultimately acquired fame and fortune; and the impression among his companions in the schools—where he was still one of the most regular attendants—as well as among artists and patrons, was, that he was a good-tempered plodding fellow, but would never become a successful painter. His friends suggested a visit to Italy, and for Italy accordingly—intending a year's stay in the land of art—he set out in the autumn of 1816. But he soon became home-sick—moreover one of his oft-recurring love-fits—for "one of my prevailing weaknesses was a propensity to fall in love"—was strong upon him, and within three months he was back again and hard at work in London.

But his run into Italy, and still more a short stay among the painters of Paris, did him good service. He saw a new style of art, and new methods of execution, and had a fresh range of subjects suggested to his mind. It was not however till some three or four more years had passed away that he began to catch the eye of the artistic world. In 1820 he says, "I sent a small picture to the British Gallery, highly finished and carefully wrought; it made a considerable noise. I sent a larger the same year to the Royal Academy; it made a still greater noise." This last was the 'Coral Fishers—Venus and her youthful Satellites arriving at the Isle of Paphos,' the first of his long series of representation of the undraped feminine form, for which Grecian and Roman poetry or legend suggested the subject or furnished the apology. This was followed the next year by his 'Cleopatra's arrival in Cilicia,' a work far more glowing in colour, skilful in composition, and brilliant in general effect; and its success was complete. The painter at once became famous. It was commissioned by Sir Francis Freeling, who however, startled by the then unusual freedom with which the painter had depicted his beryl of fair forms—for Etty, reading as literally as possible the statement that Cleopatra appeared in the character of Venus, with her attendants as Nereides, Graces, Cupids, and Tritons, had rendered the voluptuous subject with infinite gusto—besought the painter to add a little drapery; and, though he never added too much, the hint was not lost, for while, during the rest of his life the nude female form continued to be the chief subject on which he exercised his pencil, he henceforth seldom suffered one to appear without some, however scant and unserviceable, clothing.

After this great success Etty resolved again to visit Italy, and though he this time also carried with him a new love sorrow, he did not suffer himself again to return without seeing Rome. There, and at Venice, where he stayed seven months, he laboured with a diligence and copied with a rapidity and decision of execution, which astonished the degenerate native painters; and the effect of his studies of the great Venetian colourists was displayed in every picture he subsequently executed. On his return he painted a 'Pandora crowned by the Seasons,' which at the exhibition of 1824 won for him new laurels, had the singular honour of being purchased by the President, and procured his election as Associate of the Royal Academy. "Strike while the iron is hot; you see what may be done by a little courage," was the advice now tendered by his old master, and Etty profited by the well-timed counsel. A succession of important works followed, some of large size and in the historical style, but mostly classic subjects of the order indicated above, and each succeeding one,—until he became careless or negligent under the pressure of competing patrons claiming ever new pictures from him,—contributing its share towards placing him in the position he ultimately obtained by general consent, of the first English colourist of his day, and also by far the first English painter in his own peculiar walk of any day.

His life was a very quiet one. His days were almost entirely spent in London and in his painting-room—the only breaks being an occasional visit to a friend in the country, a run to Edinburgh or to the Netherlands, and a brief stay on account of illness at York. His evenings he passed, during the academic session, almost invariably in the Life School at the Royal Academy, where to the last he was one of the most regular and diligent among the students—it being his practice to paint studies in oil from the living model as shown there by gas-light—a practice which explains much that is evil as well as good in his painting of flesh: and so much attached was he to the Life Academy, that when it was formally suggested to him from the academicians, in prospect of his election as R.A. in 1823, that those

gentlemen wished him to discontinue his attendance, as they deemed his taking his place among the students incompatible with the dignity of an academician, he replied that he would rather forego that honour, though the chief object of his ambition, than give up the Life Academy. Though always in love, Etty never married. A niece kept his house, and his quiet and blameless life passed on without adventure, in the steady practice of his calling, till 1848, when failing health and powers induced him to return to his native city; where in a pleasant little house his remaining days, with the exception of his visits to London, passed in almost unbroken tranquillity. He died there on the 13th of November 1849, and was buried in the churchyard of St. Olave Marygate; his funeral being attended by a large number of the citizens, headed by the mayor and other municipal authorities, with the Council of the Yorkshire Philosophical Society, the pupils of York School of Design (in the establishment of which he took an active part), &c.

We have not attempted to record the appearance of more than a few of Etty's earlier pictures. To have mentioned in succession even the more attractive of the works of so prolific a painter during his career of nearly forty years would have been manifestly impossible here. The great event of his life was the collection of as many of his works as could be obtained, and their exhibition in 1848, in the rooms of the Society of Arts, and on that occasion were exhibited about 130 paintings, many of them of very large size. Few who saw that remarkable gathering will be likely to forget it, and the painter may well have felt proud as he gazed on so splendid a spectacle—and all the work of his own right hand.

Etty has himself, in the 'Autobiography' so often quoted, given a list of his principal paintings. And first he places of course his great historical pictures, his account of which will serve in some measure to illustrate the peculiar character of the man:—"My aim in all my great pictures has been to paint some great moral on the heart: 'The Combat,' the *Beauty of Mercy*; the three 'Judith' pictures—*Patriotism*, and self-devotion to her country, her people, and her God; 'Benaiah, David's chief Captain,' *Valour*; 'Ulysses and the Sirens,' the importance of resisting *Sensual Delights*, or an Homeric paraphrase on the 'Wages of Sin is Death'; the three pictures of 'Joan of Arc,' *Religion*, *Valour*, *Loyalty and Patriotism*, like the modern Judith; these in all make nine colossal pictures, as it was my desire to paint three times three." Of his other principal works the following may be mentioned as characteristic examples:—"The Judgment of Paris"; 'Venus attired by the Graces'; 'Hylas and the Nymph'; 'The Bery of Fair Women'; 'The Rape of Proserpine'; 'La Fleur-de-Lis'; 'The Parting of Hero and Leander'; 'Diana and Endymion'; 'The Death of Hero and Leander'; 'The Graces'; 'A Bivouac of Cupid and his Company'; and numerous Cupids and Psyches, Venuses, Leda, or as he more prudently terms them 'Nymphs with Swans,' &c.; besides his 'Samson and Delilah'; 'Magdalen'; 'Captives by the Waters of Babylon'; 'Parable of the Ten Virgins'; and other scriptural subjects treated in a very unpuritanic style. The 'Judith' series, the 'Combat,' and 'Benaiah,' five colossal pictures magnificent in colour and execution, and in many respects admirable in conception and composition—even if they are not fairly to be classed in the highest style of historic art,—were purchased in a fine spirit by the Royal Scottish Academy; 'Ulysses and the Sirens' is the property of the Royal Manchester Institution. The only picture possessed by the nation of Etty's painting is that of 'Youth at the Prow and Pleasure at the Helm,' in the Vernon Gallery.

Etty is undoubtedly one of the greatest names in English art. He chose for himself a somewhat remarkable path, and in it he walked without a rival. His want of classical knowledge—his learning being pretty nearly confined to Lemprière's Dictionary—together with his deficiency in every kind of intellectual culture, except in the technique of painting, of course militated against his taking a first rank as a painter of classic themes. All his works evidence his want of acquaintance with the history, the archaeology, and even with the poetry of Greece and Rome. But, allowance being made for these deficiencies, or rather regarding his pictures as the mere vehicles for the exhibition of the undraped human form, his paintings must be allowed a very high place in comparison with those of any other modern painter.

To the highest order of female beauty either in face or form he never attained—hardly pretended; yet there is evidenced in all his female figures such a thorough sense of enjoyment, so much life and heartiness, and, looking at them as pictures, there is shown so remarkable a knowledge of the female form, and such facility in rendering it in free spontaneous action, as few if any modern artists of any country have equalled, and none even in olden times surpassed.

Etty towards the close of his life seems to have become especially disturbed by the strong remarks occasionally made on his choice of subjects, and still more on his mode of treatment. He seems to have thought (and his admirers have spoken as though they thought so too), that the objections raised to so free a display of the female form on the score of morality, was in fact an implication that the painter was immoral. But no such charge could have been intended by any one who knew anything of the painter. Few men in private life have given less occasion to the breath of scandal. He was scrupulously upright, sober, and pure. An enthusiast in his art he was one of the most single-minded of men; but it was not to be wondered at that the

painter of works so opposed to the current notions of propriety should have had to bear with some hard judgments on the tendency of his works. He sought to vindicate himself and his intentions with his pen as well as his tongue, but while personally he needed no vindication, the only vindication his pencil can receive must be that which the works themselves furnish.

(*Autobiography in Art-Journal*, 1849; Gilchrist, *Life of William Etty*, R.A., 2 vols. 8vo, 1855.)

EUCLID OF ALEXANDRIA. A writer who has given his own name to a science cannot be fairly treated of in any other place than its history. We shall therefore devote the present article to such an imperfect sketch of the early progress of the science of geometry as its meagre history, combined with the narrowness of our limits, will allow.

There is a *stock history* of the rise of geometry, supported by the names of Strabo, Diodorus, and Proclus, namely, that the Egyptians, having their landmarks yearly destroyed by the rise of the Nile, were obliged to invent an art of land-surveying in order to preserve the memory of the bounds of property—out of which art geometry arose. This story, combined with another attributing the science directly to the gods, forms the first light which we have on the subject, and both in one are worthily sung by the poet who figures at the head of an obsolete English course of mathematics:—

"To teach weak mortals property to scan,
Down came Geometry and form'd a plan."

There is no proof whatever that the Egyptians were more of geometers than of astronomers, and the supposition that the rise of the Nile obliged the builders of the Pyramids to make new landmarks once a year, requires at least contemporary evidence to make it history. At the same time, the question of the actual origin of geometry is a very difficult one, and any conclusion can only be of very moderate probability.

Among the Chinese the Jesuit missionaries found very little knowledge of the properties of space: a few rules for mensuration, and the famous property of the right-angled triangle, being all that they could ascertain. Of all the books which Gaubil could find professing to be written before B.C. 206, there is only one which contains anything immediately connected with geometry. From this writing (called 'Toheou-pey') it is not very certain whether the Chinese possessed the property of the right-angled triangle generally, or only one particular case, namely, when the sides are 3, 4, and 5; and nothing appears which directly or indirectly resembles demonstration. The Hindoos produce a much larger body of knowledge, but of uncertain date. The works of Brahmagupta and Bhaskara, of the 7th and 12th centuries of the Christian era (according to Colebrooke), contain a system of arithmetical mensuration which is certainly older than the compilers mentioned, and in which the property of the right-angled triangle is made to produce a considerable number of results; for instance, the method of finding the area of a triangle of which the three sides are given. By a figure drawn on the margin of some manuscripts, it appears that a demonstration of the property in question had been obtained. The circumference of the circle is given as bearing to the diameter the proportion of 3927 to 1250 by the later writer, being exactly that of 3:1416 to 1. Brahmagupta takes the proportion of the square root of 10 to 1, or 3:16 to 1. The superior correctness of the later writer could not have arisen from any intermediate communication with Europe, since the true ratio was not known so near as 3:1416 till after the 12th century; and the Persians (as appears by the work of Mohammed-ben-Musa) had adopted this ratio from the Hindoos, before the discovery of an equally exact ratio in Europe. We shall enter into more details on this subject in the article *VIOA GANITA*, merely observing that though no date can be fixed to the commencement of geometry in India, yet the certainty which we now have that algebra and the decimal arithmetic have come from that quarter, the recorded visits of the earlier Greek philosophers to Hindustan (though we allow weight rather to the tendency to suppose that philosophers visited India, than to the strength of the evidence that they actually did so), together with the very striking proofs of originality which abound in the writings of that country, make it essential to consider the claim of the Hindoos, or of their predecessors, to the invention of geometry. That is, waiving the question whether they were Hindoos who invented decimal arithmetic and algebra, we advance that the people which first taught those branches of science is very likely to have been the first which taught geometry; and again, seeing that we certainly obtained the former two either from or at least through India, we think it highly probable that the earliest European geometry came either from or through the same country.

Of the Babylonian and of the Egyptian geometry we have no remains whatever, though each nation has been often said to have invented the science. In reference to the authorities mentioned above in favour of the Egyptians, to whom we may add Diogenes Laertius, &c., we may say that no one of the writers who tell the story in question is known as a geometer except Proclus, the latest of them all; and as if to give the assertion the character of an hypothesis, this last writer also adds that the Phœnicians, on account of the wants of their commerce, became the inventors of arithmetic. In the Jewish writings there is no trace of any knowledge of geometry. So that,

allowing the Greeks to have received the merest rudiments either from Egypt or India, or any other country, it is impossible to name any quarter from which we can with a shadow of probability imagine them to have received a deductive system, to ever so small an extent. That their geometry, or any of it, came direct from India, is a supposition of some difficulty: those who brought it could hardly have failed to bring with it the decimal notation of arithmetic. That Pythagoras travelled into India, is (according to Stanley) only the assertion of Apuleius and Clemens Alexandrinus, though rendered probable by several of his tenets.

Thales (B.C. 600) and Pythagoras (B.C. 540) founded the earliest schools of geometry. The latter is said to have sacrificed a hecatomb when he discovered the property of the hypothenuse before alluded to, and this silly story is repeated whenever the early history of geometry is given. A large collection of miscellanies might easily be made from the works of writers who were not themselves acquainted with geometry; but, rejecting such authorities, we shall content ourselves with citing Pappus and Proclus, both geometers, who, living in the 4th and 5th centuries after Christ, had abundant opportunities of hearing the stories to which we allude, and of receiving or rejecting them.

According to Proclus (book ii. ch. 4, 'Comm. in Eucl.'), Pythagoras was the first who gave geometry the form of a science, after whom came Anaxagoras, (Enopides, Hippocrates of Chios (who invented the well-known quadrature of the lunules), and Theodorus of Cyrene. Plato was the next great advance of the science, with whom were contemporary Leodamas, Archytas, and Theætetus of Thasus, Tarentum, and Athens. After Leodamas came Neoclides, whose disciple Leo made many discoveries, added to the accuracy of the elements, and gave a method of deciding upon the possibility or impossibility of a problem. After Leo came Eudoxus, the friend of Plato, who generalised various results which came from the school of the latter. Amyclias, another friend of Plato, and the brothers Menæchmus and Dinostratus, made geometry more perfect. Theudius wrote excellent elements, and generalised various theorems. Cyzcianus of Athens cultivated other parts of mathematics, but particularly geometry. Hermotimus enlarged the results of Eudoxus and Theætetus, and wrote on 'loci.' Next is mentioned Philippus, and after him Euclid, "who was not much younger than those mentioned, and who put together elements, and arranged many things of Eudoxus, and gave unanswerable demonstrations of many things which had been loosely demonstrated before him." He lived under the first Ptolemy, by whom he was asked for an easy method of learning geometry; to which he made the celebrated answer, that there was no royal road. He was younger than the time of Plato, and older than Eratosthenes and Archimedes. He was of the Platonic sect.

Such is, very nearly entire, the account which Proclus gives of the rise of geometry in Greece.

Before the time of Euclid demonstration had been introduced, about the time, perhaps by the instrumentality, of Pythagoras; pure geometry had been restricted to the right line and circle, but by whom is not at all known: the geometrical analysis, and the study of the conic sections, as also the considerations of the problems of the duplication of the cube, the finding of two mean proportionals, and the trisection of the angle, had been cultivated by the school of Plato; the quadrature of a certain circular space had been attained, and the general problem suggested and attempted by Hippocrates and others; a curve of double curvature had been imagined and used by Archytas; writings existed both on the elements, and on conic sections, loci, and detached subjects. It is in this part of the present article that we have judged it best to introduce what would otherwise have formed the article EUCLID.

It is not known where EUCLID OF ALEXANDRIA was born. He opened a school of mathematics at Alexandria, in the reign of Ptolemæus the son of Lagus (323—284 B.C.), from which school came Eratosthenes, Archimedes, Apollonius, Ptolemæus, the Theons, &c., &c., so that from and after Euclid the history of the school of Alexandria is that of Greek geometry. He was, according to Pappus, of a mild and gentle temper, particularly towards those who studied the mathematical sciences: but Pappus is too late an authority for the personal demeanour of Euclid, and moreover may have been incited to praise him for the purpose of depreciating Apollonius, of whom he is then speaking, and against whom he several times expresses himself. Besides the Elements, Euclid wrote, or is supposed to have written, the following works:—

1. *Σύγγραμμα Πευδῶν*, a treatise on 'Fallacies,' preparatory to geometrical reasoning. This book, mentioned by Proclus, does not now exist, and there is no Greek work of which we so much regret the loss. Had it survived, mathematical students would not have been thrown directly upon the Elements, without any previous exercise in reasoning.

2. Four books of 'Conic Sections,' afterwards amplified and appropriated by Apollonius, who added four others. So says Pappus, as already mentioned in APOLLONIUS PERGÆUS. That Euclid did not write these books, appears to us more than probable from the silence of Proclus the Platonist, who, eulogising Euclid the Platonist, and stating that he wrote on the regular solids (a part of geometry cultivated by the Platonists), being led thereto by Platonism, never

mentions his writing on the still more Platonic subject of the conic sections. But that Aristæus had written on the subject is known, and that Euclid taught it cannot be doubted, any more than that Apollonius, like other writers, prefixed to his own discoveries all that he judged fit out of what was previously known on the subject.

3. *Περί Διαίρεσεων*, on 'Divisions.' This work is mentioned by Proclus in two words. John Dee imagined the book of Mohammed of Bagdad (which is annexed to the English edition of Euclid herein-after cited) on the division of surfaces to be that of Euclid now under consideration; but there seems to be no ground for this notion. The Latin of this work (from the Arabic) is given at the end of Gregory's Euclid, together with a fragment 'De Levi et Ponderoso,' attributed, without any foundation, to Euclid.

4. *Περί Πορισμάτων*, on 'Porisms,' in three books. This is mentioned both by Pappus and Proclus, the former of whom gives the enunciations of various propositions in it, but the text is so corrupt that they can hardly be understood.

5. *Τόπων πρὸς ἐπιφάνειαν*, 'Locorum ad Superficiem,' which we cannot translate. It is mentioned by Proclus, but has not come down to us.

The preceding works are either lost or doubtful; those which follow all exist, and are contained in Gregory's edition, in the order inverse to that in which they are here mentioned.

6. *Ὀπτικά καὶ καταπτρικά*, on 'Optics and Catoptrics.' These books are attributed to Euclid by Proclus, and by Marinus in the preface to the 'Data,' or rather books on these subjects. Savile, Gregory, and others doubt that the books which have come down to us are those of Euclid, and Gregory gives his reasons in the preface, which are—that Pappus, though he demonstrates propositions in optics and also in astronomy, and mentions the 'Phænomena' of Euclid with reference to the latter, does not mention the 'Optics' with reference to the former; and that there are many errors in the works in question, such as it is not likely Euclid would have made. Proceeding on the supposition that rays of light are carried from the eye to the object, the first of these books demonstrates some relations of apparent magnitude, and shows how to measure an unknown height by the well-known law of reflected light. In the second an imperfect theory of convex and concave mirrors is given.

7. *Φαινόμενα*, on 'Astronomical Appearances,' mentioned by Pappus and Philoponus (cited by Gregory). It contains a geometrical doctrine of the sphere, and, though probably much corrupted by time, is undoubtedly Euclid's.

8. *Κατατομή κανόνος καὶ εἰσαγωγή ἁρμονικῆς*, the 'Division of the Scale' and 'Introduction to Harmony.' Proclus mentions that Euclid wrote on harmony, but the first of these treatises is a distinct geometrical refutation of the principles laid down in the second, which renders it unlikely that Euclid should have written both. The second treatise is Aristoxenian [ARISTOXENUS], while the first proceeds on principles of which Gregory states he never found a vestige in any other writer who was reputed anterior to Ptolemæus (to whom he attributes it). The second treatise is not geometrical, but is purely a description of the system mentioned, and as this treatise is not alluded to by Ptolemæus nor by any previous writer on the subject, it is very probable that Euclid did not write it.

9. *Δεδομένα*, a 'Book of Data.' This is the most valuable specimen which we have left of the rudiments of the geometrical analysis of the Greeks. Before a result can be found, it should be known whether the given hypotheses are sufficient to determine it. The application of algebra settles both points; that is, ascertains whether one or more definite results can be determined, and determines them. But in geometry it is possible to propose a question which is really indeterminate, and in a determinate form, while at the same time the methods of geometry which give one answer may not give the means of ascertaining whether the answer thus obtained is the only one. Thus the two following questions seem equally to require one specific answer, to one not versed in geometry:—

Given, the area of a parallelogram, and the ratio of its sides; required, the lengths of those sides: and

Given, the area of a parallelogram, the ratio of its sides and one of its angles; required, the lengths of the sides.

The first question admits of an infinite number of answers, and the second of only one; or, in the language of Euclid, if the area, ratio of sides, and an angle of a parallelogram be given, the sides themselves are given. The same process by which it may be shown that they are given serves to find them; so that the Data of Euclid may be looked upon as a collection of geometrical problems, in which the attention of the reader is directed more to the question of the sufficiency of the hypothesis to produce one result, and one only, than to the method of obtaining the result.

A preface to this book was written by one Marinus, the disciple and successor of Proclus, explaining at tedious length the distinction of 'given' and 'not given.'

10. *Στοιχεῖα*, the 'Elements' (of Geometry). For a long time writers hardly considered it necessary to state whose 'Elements' they referred to, since a certain book of the elements always signified that book of Euclid; and it was customary in England to call each book an element; thus in Billingsley's old translation the sixth book is called the sixth element.

The reason why the 'Elements' have maintained their ground is

not their extreme precision in the statement of what they demand; for it frequently happens that a result is appealed to as self-evident which is not to be found in the expressed axioms. Neither does their fame arise from their never assuming what might be proved; for in the very definitions we find it asserted that the diameter of a circle bisects the figure, which might be readily proved from the axioms. Neither is it the complete freedom from redundancy, nor the perfection of the arrangement; for book i., prop. 4, which is very much out of place, considering that it is never wanted in the first book, is, in point of fact, proved again, though not expressed, in prop. 19. Neither is it the manner in which our ideas of magnitude are rendered complete, as well as definite: for instance, book iii. prop. 20 is incomplete without Euclid's definition and use of the term 'angle'; nor with that term, as used by him, can the 21st proposition of that book be fully demonstrated without the help of the subsequent 22nd. In fact, the 'Elements' abound in defects, which, if we may so speak, are clearly seen by the light of their excellences; the high standard of accuracy which they inculcate in general, the positive and explicit statement which they make upon all real and important assumptions, the natural character of the arrangement, the complete and perfect absence of false conclusion or fallacious reasoning, and the judicious choice of the demonstrations, considered with reference to the wants of the beginner, are the causes of the universal celebrity which this book has enjoyed. We shall now describe the contents of the 'Elements.'

There are thirteen books certainly written by Euclid, and two more (the fourteenth and fifteenth) which are supposed to have been added by Hypsicles of Alexandria (about A. D. 170).

Book i. lays down the definitions and postulates required in the establishment of plane geometry, a few definitions being prefixed also to books ii., iii., iv., and vi. It then treats of such properties of straight lines and triangles as do not require any particular consideration of the properties of the circle nor of proportion. It contains the celebrated proposition of Pythagoras.

From this book it appears that Euclid lays down, as all the instrumental aid permitted in geometry, the description of a right line of indefinite length, the indefinite continuation of such right line, and the description of a circle with a given centre, the circumference of which is to pass through a given point. It is usual to say, then, that the rule and compasses are the instruments of Euclid's geometry, which is not altogether correct, unless it be remembered that with neither ruler nor compasses is a straight line allowed to be transferred, of a given length, from one part of space to another. It is a plain ruler, whose ends are not allowed to be touched, and compasses which close the moment they are taken off the paper, of which the Greek geometry permits the use. It is altogether uncertain by whom these restrictive postulates were introduced, but it must have been before the time of Plato, who was contemporary with (if he did not come after) the introduction of those problems whose difficulty depends upon the restrictions. We may here observe that in actual construction the ruler might have been dispensed with. It was reserved for an Italian abbé, at the end of the 18th century, when all who studied geometry had for two thousand years admired the smallness of the bases on which its conclusions are built, to inquire whether, small as they were, less would not have been sufficient. In Mascheroni's 'Geometria del Compasso,' published at Pavia in 1797, it is shown that all the fundamental constructions of geometry can be made without the necessity of determining any point by the intersections of straight lines; that is, by using only those of circles. This singular and very original work was translated into French, and published at Paris in 1798 and 1828.

Book ii. treats of the squares and rectangles described upon the parts into which a line is divided. It opens the way for the application of geometry to arithmetic, and ends by showing how to make a rectangle equal to any rectilinear figure. It also points out what modification the proposition of Pythagoras undergoes in the case of a triangle not right-angled.

Book iii. treats of the circle, establishing such properties as can be deduced by means of the preceding books.

Book iv. treats of such regular figures as can readily be described by means of the circle only, including the pentagon, hexagon, and quindecagon. It is of no use in what immediately follows.

Book v. treats of proportion generally, that is, with regard to magnitude in general. Whether this most admirable theory, which though abstruse is indispensable, was the work of Euclid himself, or a predecessor, cannot now be known. The introduction of any numerical definition of proportion is rendered inaccurate by the necessity of reasoning on quantities between which no exact numerical ratio exists. The method of Euclid avoids the error altogether, by laying down a definition which applies equally to commensurables and incommensurables, so that it is not even necessary to mention this distinction.

Book vi. applies the theory of proportion to geometry, and treats of similar figures, that is, of figures which differ only in size, and not in form.

Book vii. lays down arithmetical definitions; shows how to find the greatest common measure and least common multiple of any two numbers; proves that numbers which are the least in any ratio are prime to one another, &c.

Book viii. treats of continued and mean proportionals, showing when it is possible to insert two integer mean proportionals between two integers.

Book ix. treats of square and cube numbers, as also of plane and solid numbers (meaning numbers of two and three factors). It also continues the consideration of continued proportionals, and of prime numbers, shows that there is an infinite number of prime numbers, and demonstrates the method of finding what are called *perfect numbers*.

Book x. contains 117 propositions, and is entirely filled with the investigation and classification of incommensurable quantities. It shows how far geometry can proceed in this branch of the subject without algebra; and though of all the other books it may be said that they remain at this time as much adapted for instruction as when they were written, yet of this particular book it must be asserted that it should never be read except by a student versed in algebra, and then not as a part of mathematics, but of the history of mathematics. The book finishes with a demonstration that the side and diagonal of a square are incommensurable. From this book it is most evident that the arithmetical character of geometrical magnitude had been very extensively considered; and it seems to us sufficiently clear that an arithmetic of a character approximating closely to algebra must have been the guide, as well as that some definite object was sought—perhaps the attainment of the quadrature of the circle.

Book xi. lays down the definitions of solid geometry, or of geometry which considers lines in different planes and solid figures. It then proceeds to treat of the intersections of planes, and of the properties of parallelepipeds, or what might be called solid rectangles.

Book xii. treats of prisms, cylinders, pyramids, and cones, establishing the properties which are analogous to those of triangles, &c., in the first and sixth books. It also shows that circles are to one another as the squares on their diameters, and spheres as the cubes on their diameters, in which for the first time in Euclid, the celebrated Method of Exhaustions is employed, which, with the theory of proportion, forms the most remarkable part of this most remarkable work.

Book xiii., the last of those written by Euclid, applies some results of the tenth book to the sides of regular figures, and shows how to describe the five regular bodies.

Books xiv. and xv., attributed to Hypsicles of Alexandria, treat entirely of the relative proportions of the five regular solids, and of their inscription in one another.

The writings of Euclid continued to be the geometrical standard as long as the Greek language was cultivated. The Romans never made any progress in mathematical learning. Boethius (BOETHIUS) translated, it is said, the first book of Euclid (Cassiodorus, cited by Heilbronner), but all which has come down to us on the subject from this writer (who lived at the beginning of the 6th century) is contained in two books, the first of which has the enunciations and figures of the principal propositions of the first four books of the Elements, and the second of which is arithmetical. Some of the manuscripts of this writer contain an appendix which professes to give an account of a letter of Julius Cæsar, in which he expresses his intention of cultivating geometry throughout the Roman dominions. But no such result ever arrived as long as the Western Empire lasted; and this short account of Roman geometry is a larger proportion of the present article than the importance of the subject warrants. These books of Boethius continued to be the standard text books until Euclid was brought in again from the Arabs.

Among the last-mentioned race geometry made no actual progress, though many of the works of the Greek writers were translated, and Euclid among the rest. There are several Arabic versions, the most perfect of which is that of Othman of Damascus, who augmented the usual imperfect translations by means of a Greek manuscript which he saw at Rome. D'Herbelot (at the words Aklides and Oclides) states that the Orientals believe Euclid to have been a native of Tyre, and also that they frequently gave his name to the science which he taught. The same author gives the names of the Arabic versions, one of which, that of Nasir eddin, the most celebrated of all, was printed at the Medicean press at Rome in 1594. The astronomer Thabet ben Korrah was one of the translators, or rather, perhaps, revised the translation of Honein ben Ishak, who died A.D. 873. There is a manuscript in the Bodleian Library, purporting to be the translation of the latter edited by the former.

The first translation of Euclid into Latin, of which the date can be tolerably well fixed, is that of Athelard, or Adelard, a monk of Bath, who lived under Henry I. (about A.D. 1150). We have given [CAMPAUS] a summary of authorities to show that Campanus, supposed to be another translator of Euclid, lived after this period; but we are inclined to believe that this translation (so called) of Campanus (printed 1482), is in fact that of Athelard, with a commentary by Campanus.

There is a considerable number of Greek manuscripts of the Elements, for which see Fabricius and Heilbronner. There is no account of the manuscripts which they consulted by the earlier Latin translators (from the Greek), nor by Gregory. It appears however that several, if not many, of the manuscripts are entitled *Εὐκλείδου στοιχείων*

βιβλία αὐτῶν Θεωνος συνουσίαν, from which it was inferred that the compilation of the elements was the work of Theon, from the materials left by Euclid. It is certain that Theon, in his commentary on the *Almagest*, speaks of his edition (ἐκδοσίς) of Euclid, and mentions that the part of the last proposition which relates to the sectors was added by himself. On looking at that proposition, it is found that the demonstration relative to the sectors comes after the 'ἕπερ εἶδει δεῖξαι,' with which Euclid usually ends his propositions. And Alexander, the commentator on Aristotle, who lived before Theon, calls that the 'fourth' proposition of the tenth book which is the 'fifth' in all the manuscripts. We can then distinctly trace the hand of Theon as a commentator, and may suspect that he performed the duty of a revising editor to the work of Euclid as it now appears; but there is not the smallest reason to suppose that Theon actually digested the work into the form which it now has. These remarks relative to the claims of Theon were first made by Sir Henry Savile, who opened the chair of geometry which he founded at Oxford by thirteen lectures on the fundamental parts of the first book of Euclid, which were delivered in 1620, and published in 1621.

We now give a short summary of the early editions of Euclid, which have appeared in Greek or Latin. It is unnecessary to specify the common editions of Simson, Playfair, &c., which confine themselves to the first six books, and the eleventh and twelfth, and are generally known.

I. Editions of the whole of Euclid's works:—1. An imperfect Latin edition, by Bartholomew Zamberti, Venice, 1505. 2. A Latin edition, printed at Basel, marked 'Basileæ apud Johannem Hervagium,' 1537, 1546, and 1558. 3. Greek edition, with Scholia, Basel, 1539. But the principal edition of all the works of Euclid is that published by the Oxford press in 1703, under the care of David Gregory, then Savilian professor.

II. Greek editions of the Elements only:—1. An edition curâ Simonis Grynei, Basel, 1530. 2. Another, with the commentary of Proclus, 'Basileæ apud Johannem Hervagium,' 1538. 3. Greek and Italian, by Angelus Cajani, Rome, 1545. 4. At Strasburg, 1559. 5. Greek and Latin, with Scholia, by Conrad Dasypodius, Strasburg, 1564.

III. Latin editions of the Elements only:—1. That of Campanus, the first Euclid printed, Ratdolt, Venice, 1482. 2. A reprint of the preceding, marked 'Vincentis, anno salutis 1491.' 3. An edition containing the text and comment of Campanus, from the Arabic; also the text and comment of Zamberti, from the Greek; Paris, Henry Stephens, 1505; and again in 1616. This edition is very commodious for a general comparison of the Greek and Arabic. 4. Edition of Lucas de Burgo, Venice, 1509, according to Murhard, and 1489 according to Heilbronner, who appears to be the authority for the existence of this edition, and is doubted (with reason, we think) by Harles, in his *Fabricius*. 5. Edition of Stephen Græcili, Paris, 1557, 1578, and 1578. The first edition of Clavius is that of Rome, 1574; of Commandine, Pesaro, 1572. [CLAVIUS; COMMANDINE.]

IV. Earliest editions of the Elements in modern tongues:—*English*—'The Elements of Geometry of the most antient philosopher Euclid of Megara, &c.,' by H. Billingsley, with a preface by John Dee, London, 1570, and again in 1661. *French*—'Les quinze livres des Elements, &c., &c.,' Par D. Henrion, Mathematicum, First edition, Paris, 1565 (?); second, 1623, with various others. According to Fabricius there was an edition by Peter Forcadel, in 1565. *German*—'Die sechs ersten Bucher, &c.,' by William Holtzmann, Augsburg, 1562. Scheubelius had previously given the 7th, 8th, and 9th books in 1555. *Italian*—'Euclide Megarense Philosopho, &c.,' per Nicolo Tartalea, Venice, 1543. *Dutch*—'De ses erste boecken Euclidia, &c.,' dor Jan Pieterszoon Dou, Amsterdam, 1608 (or 1606). *Swedish*—'De sex Forsta, &c.,' by Marten Stromer, Upsal, 1763. *Spanish*—By Joseph Saragoza, Valencia, 1673. Murhard (compared with Fabricius) is the authority for all of these, except the first.

It has long ceased to be usual to read more of Euclid than the first six books and the eleventh. Those who wish to see more of the 'Elements' will probably most easily obtain those of Williamson (London, 1788, two vols. 4to), the translation of which is very literal. Those who prefer the Latin may find all the twelve books in the edition of Horsley (from Commandine and Gregory), Oxford, 1802. As to the Greek, the edition of Gregory is scarce, as is the edition of Peyrard, in Greek, Latin, and French, Paris, 1814; that of Camerer and Hauber, Berlin, 1824, contains the first six books in Greek and Latin, with valuable notes. The number of editions of Euclid is extremely great, but our limits will not allow of further recapitulation.

Under the names of Archimedes, Apollonius, Pappus, Proclus, Theon, &c., the reader will find further details upon the progress of Greek geometry, which continued to flourish at Alexandria till the taking of that town by the Saracens, A.D. 640. But its latter day produced only commentators upon the writers of the former, or, at most, original writers of no great note. The following list contains the names of the most celebrated geometers who lived before the decline of the Greek language: the dates represent nearly the middle of their lives, but are in many instances uncertain:—

Thales, B.C. 600; Anaxagoras (?); Pythagoras, B.C. 550; Anaxagoras; Anaxagoras; Hippocrates, B.C. 450; Theodorus; Archytas (?), preceptor of Plato; Leodamas; Theætetus; Aristæus, B.C. 350; Perseus (?);

Plato, B.C. 310; Menæchmus, Dinostratus, Eudoxus, contemporaries of Plato; Neoclides; Leon; Amyclæus; Theudius; Cyziotinus; Hermotimus; Philippus; Euclid, B.C. 285; Archimedes, B.C. 240; Apollonius, B.C. 240; Eratosthenes, B.C. 240; Nicomedes, B.C. 150; Hipparchus, B.C. 150; Hypsicles, B.C. 130 (?); Geminus, B.C. 100; Theodosius, B.C. 100; Menelaus, A.D. 80; Ptolemaeus, A.D. 125; Pappus, A.D. 390; Serenus, A.D. 390; Diocles (?), Proclus, A.D. 440; Marinus (?), Isidorus (?), Eutocius, A.D. 540.

The age of Diophantus is not sufficiently well known even for so rough a summary as the preceding.

The following is the summary of books of geometrical analysis (qui ad resolutum locum pertinent), given by Pappus as extant in his time: of Euclid, the 'Data,' three books of porisms, and two books 'Locorum ad Superficiem,' of Apollonius, two books 'De Proportionis Sectione,' two 'De Spatii Sectione,' two 'De Tactionibus,' two 'De Inclinationibus,' two 'Planorum Locorum,' and eight on conic sections; of Aristæus, five books 'Locorum Solidorum,' of Eratosthenes two books on finding mean proportionals. But besides these he describes a book (of Apollonius) which treats 'De Determinata Sectione.'

The manifold beauties of the 'Elements' of Euclid secured their universal reception, and it was not long before geometers began to extend their results. It became frequent to attempt the restitution of a lost book by the description given of it by Pappus or others; and from Vieta to Robert Simson, a long list of names might be collected of those who have endeavoured to repair the losses of time. On the advance of geometry in general the reader may consult the lives of Vieta, Metius, Magini, Pitiscus, Snell, Napier, Guidinus, Cavalieri, Roberval, Fermat, Pascal, Descartes, Kepler, &c.

The application of algebra to geometry, of which some instances had been given by Bombelli, and many more by Vieta, grew into a science in the hands of Descartes (1596-1650). It drew the attention of mathematicians completely away from the methods of the ancient geometry, and considering the latter as a method of discovery, the change was very much for the better. But the close and grasping character of the ancient reasoning did not accompany that of the new method: algebra was rather a half-understood art than a science, and all who valued strictness of demonstration adhered as close as possible to the ancient geometry. This was particularly the case in our own country, and unfortunately the usual attendants of rigour were mistaken for rigour itself, and *vice versa*. The algebraical symbols and methods were by many reputed inaccurate, while the same processes, conducted on the same principles, in a geometrical form, were preferred and even advanced as more correct. Newton, an admirer of the Greek geometry, clothed his *Principia* in a dress which was meant to make it look (so far as mathematical methods were concerned) like the child of Archimedes, and not of Vieta or Descartes; but the end was not attained in reality, for though the reasoning is really unexceptionable, yet the method of exhaustions must be applied to most of the lemmas of the first section, before the Greek geometer would own them.

The methods of algebra, so far as expressions of the first and second degrees are concerned, apply with great facility to many large classes of questions connected with straight lines, circles, and other sections of the cone. Practical facility was gained by them, frequently at the expense of reasoning: the time came when a new Descartes showed how to return to geometrical construction with means superior to those of algebra, in many matters connected with practice. This was Monge, the inventor of descriptive geometry. The science of perspective and many other applications of geometry to the arts had previously required isolated methods of obtaining lines, angles, or areas, described under laws not readily admitting of the application of algebra, and its consequence, the construction of tables. The descriptive geometry is a systematised form of the method by which a ground-plan and an elevation are made to give the form and dimensions of a building. The projections of a point upon two planes at right angles to one another being given, the position of the point itself is given. From this it is possible, knowing the projections of any solid figure upon two such planes, to lay down on either of those planes a figure similar and equal to any plane section of the solid. In the case where the section is a curve it is constructed by laying down a large number of consecutive contiguous points. The methods by which such an object is to be attained were generalised and simplified by Monge, whose 'Géométrie Descriptive' (the second edition of which was published in 1820) is one of the most elegant and lucid elementary works in existence.

The methods of descriptive geometry recalled the attention of geometers to the properties of projections in general, of which such only had been particularly noticed as could be applied in the arts of design or in the investigation of primary properties of the conic sections. From the time of Monge to the present this subject has been cultivated with a vigour which has produced most remarkable results, and promises more. Pure geometry has made no advance since the time of the Greeks which gives greater help to its means of invention than that which the labours of what we must call the school of Monge have effected.

EUCLID (Εὐκλείδης) of Megara is said to be a different person from the geometrician of the same name. He was a scholar of Socrates,

and the founder of the school called the Megaric, which may be considered as the predecessor of the Sceptical school of a later date. This school was distinguished by its dialectic subtlety, by which contradictory propositions could be proved, the consequences of which was universal doubt. The Supreme Good, according to Euclid, was always the same and unchangeable. He wrote six dialogues, which are lost. (See 'De Megaricorum Doctrina ejusque apud Platonem et Aristotelem vestigiis,' Ferd. Deycke, Bonn, 1827, 8vo.)

EUDOCIA, daughter of Leontius, an Athenian sophist, was called Athenais before her baptism. She was celebrated for her beauty, and also for her learning, having been carefully instructed by her father in literature and the sciences. After her father's death, being deprived by her brothers of all share in the inheritance, she repaired to Constantinople, and appealed to Pulcheria, sister of Theodosius II., who was so pleased with her that she induced Theodosius to marry her, A.D. 421. Eudocia surrounded herself with learned men; but about 449 the emperor, through jealousy, dismissed all her court, and had her exiled to Palestine, where she continued to reside after his death. She there embraced the opinions of Eutyches, and supported by her liberality and influence the monk Theodosius, who forced himself into the see of Jerusalem, after driving away Juvenal, the orthodox bishop, and kept it until he was himself driven away by order of the Emperor Marcianus. Euthymius, called the Saint, by his reasonings brought back Eudocia to the orthodox faith, after which she spent the remainder of her days at Jerusalem, where she died in 460, protesting her innocence of the guilt with which her husband had charged her. Eudocia wrote several works, of which Photius quotes a translation in verse of the first eight books of the Old Testament. There is also attributed to her a 'Life of Christ,' composed of lines taken from Homer, which was translated into Latin by Richard, and published under the title of 'Homericæ Centones Græce et Latine, interprete Ehardo,' Paris, 1578. Most critics however believe that it is not the work of Eudocia, though Ducange is of the contrary opinion.

EUDOCIA the Younger, daughter of the preceding and of Theodosius II., married Valentinianus III. After the assassination of her husband by Petronius Maximus, she was obliged to marry the usurper. Eudocia, out of indignation and revenge, called in Genseric, king of the Vandals, who came to Italy, plundered Rome, and carried Eudocia to Africa with him. Some years afterwards she was sent back to Constantinople, A.D. 462, where she died.

EUDOCIA, the widow of Constantinus Ducas, married Romanus Diogenes, an officer of distinction, in 1068, and associated him with her on the throne. Three years after, Michael, her son, by means of a revolt, was proclaimed emperor, and caused his mother to be shut up in a convent, where she lived the rest of her life. She left a treatise on the genealogies of the gods and heroes, which displays an extensive acquaintance with the subject. It is printed in Villoison's 'Anecdota Græca,' 2 vols. 4to, 1781.

EUDOXUS, a native of Cnidus, a city of Caria, in Asia Minor, and the son of Æschines, flourished about B.C. 370. He studied geometry under Archytas, and afterwards travelled into Egypt to study the sciences under the priests of that country. Diogenes Laertius informs us that he and Plato studied in these schools for about thirteen years, after which Eudoxus came to Athens, and opened a school of his own, which he supported with such reputation that it excited the envy even of Plato himself. To him is attributed the introduction of the sphere into Greece; and, according to Pliny, he first made (probably from Egyptian sources) the length of the year 365½ days. Proclus informs us that Euclid very liberally borrowed from the elements of geometry composed by Eudoxus. Cicero calls Eudoxus the greatest astronomer that had ever lived; and we learn from Petronius that he retired to the top of a very high mountain that he might observe the celestial phenomena with more convenience than he could on a plain or in a crowded city. Strabo (p. 119) says that the observatory of Eudoxus was at Cnidus, from which the astronomer saw the star Canopus. Vitruvius (ix. 9) describes a sun-dial constructed by him; Strabo (p. 390) quotes him as a distinguished mathematician. Nothing of his works remains. He died in the fifty-third year of his age.

EUDOXUS of Cysicus was sent by Ptolemy VII., of Egypt, on a voyage to India about B.C. 125. (Strabo, p. 98; Casaub.) The passage of Strabo referred to contains an account of his adventures. From this Eudoxus, or another of the name, Strabo derived some materials for his great work (379, 550, &c.)

EUGÈNE, FRANÇOIS DE SAVOIE, commonly called Prince Eugene, was paternally descended, in the third degree, from the ducal house of Savoy, but was a French subject by birth, being a younger son of the Comte de Soissons, and born at Paris October 18, 1663. He was designed for the church, but having formed a decided preference for a military life, and being also moved by certain wrongs which he conceived to have been done to his family by Louis XIV., and which he deeply resented, he entered the service of the emperor Leopold. From this time he renounced his allegiance to France, and long after, when his reputation was at its height, rejected the most brilliant offers made by the French government to purchase his return to the service of his native country. His first campaign was against the Turks, at the celebrated siege of Vienna in 1683. Eminent bravery and talent, joined to high birth, ensured him rapid promotion. In

1688-89, on the breaking out of war between France and the Empire, he was employed on a diplomatic mission to the Duke of Savoy, and in 1691 was raised to the command of the imperial army in Piedmont. During two campaigns he maintained a decided advantage over the French: in 1693 he was less successful. The duke having returned to the French alliance, we next find Prince Eugene commanding the army in Hungary, where he won a great victory over the Turks at Zenta, on the river Theiss, September 11, 1697. The peace of Carlowitz (1699) closed this scene of action; but a more brilliant one was opened in 1701 by the war of the Spanish succession. During two years Eugene maintained the imperial cause in Italy with honour against superior forces commanded successively by Catinat, Villeroi, and Vendôme, against the last of whom he fought the indecisive battle of Luzara, August 1, 1702, in which the flower of his troops was destroyed. At the end of this campaign he returned to Vienna, and was appointed president of the council of war.

In 1704 he commanded the imperial troops at the battle of Blenheim, August 13, 1704. The successes of the French in Piedmont made it expedient for him to return thither in 1705. He soon restored the Duke of Savoy's declining fortunes, and won the decisive battle of Turin, September 7, 1706, after which the French evacuated the country. He was thus set again at liberty to co-operate with Marlborough in 1708, and had a share in the victory of Oudenarde, and in the capture of Lille, the siege of which was entrusted to him, while Marlborough protected his operations. In 1709 he was wounded at the bloody battle of Malplaquet, of which he was the chief adviser, and in which he led the attack upon the left wing. On the death of the emperor Joseph in 1711, he took an important part in securing the succession to his brother Charles VI., and he visited England at the end of that year, in hope of preventing the secession of England from the alliance. He was received as his services deserved, but made no progress towards his object; for the dismissal of the Whig ministry was soon followed by the congress and peace of Utrecht. The emperor being no party to that treaty, Eugene invaded France in 1712 with little advantage, and it became evident that the interests of the empire would be best consulted by peace: the preliminaries were accordingly signed at Rastadt, March 6, 1714.

In 1716 Prince Eugene again marched against the Turks, and won the battle of Peterwaradin, August 6, against an enormous disproportion of numbers. In the following year he besieged Belgrade with 40,000 men. With troops wasted by disease, pressed by an army of 150,000 men from without and opposed by a powerful garrison from within, he was in the utmost danger, when, with the happy boldness which distinguished him, he seized the right moment, and inflicted a signal defeat on the army which threatened him. Upon this the town surrendered. Peace was concluded in the following year.

He now took up his residence at Vienna, honoured and trusted by the emperor, in whose political service he was much employed. In 1738 a fresh quarrel with France called him again to command the imperial army on the banks of the Rhine. This war is said to have been undertaken against his advice: at all events age had diminished his energy: he contented himself with standing on the defensive, and used his influence to effect a reconciliation. Preliminaries of peace were signed at Vienna, October 5, 1735. He died suddenly in that capital April 21, 1736, aged 73.

As a general Prince Eugene ranks among the first of his kind, but that kind was not of the highest order of excellence. His name is memorable for no improvements in the art of war, neither was he famous for skill in manœuvring or combining the operations of distinct masses upon one object. His characteristics were penetration, quickness of perception, decision, and what usually goes along with them, readiness in amending a fault when made; so that his skill lay rather in making the best of given circumstances than in bending circumstances to his will beforehand. It is said that he always took great pains to learn the character of the general opposed to him. Careless of his own person (he was thirteen times wounded in battle), he was also somewhat prodigal of his soldiers' lives. However, he threw a glory round the Austrian arms such as has never dignified them either before or since.

The best account of his exploits is 'L'Histoire du Prince Eugène,' 5 vols. 12mo, by M. de Maubillon, but published without his name. In English, there is Campbell's 'Military History of Prince Eugene and the Duke of Marlborough,' 2 vols. folio, besides several smaller works. Prince Eugene wrote memoirs of himself, which have been published both in French and English.

EUGENIUS I., pope, a native of Rome, was elected by the Romans in 654, as successor to Martin I., who had been sent into banishment to the Thracian Chersonesus by order of the emperor Constantine II., who favoured the schism of the Monothelites. Martin dying in the following year, Eugenius continued in dispute with the court of Constantinople till he died in 657, and was succeeded by Vitalianus.

EUGENIUS II., a native of Rome, succeeded Paschas I. in 824, in the midst of great disorder which occurred at Rome owing to the corrupt state of society and mal-administration of that city. To reform these, the emperor, Louis the Good, sent his son Lotharius to Rome, who corrected many abuses which, by the account of Eginhardt and other chroniclers, had grown to an enormous extent. He confirmed the right of electing the pope to the clergy and people of Rome, but

under the condition that the pontiff elect should swear fidelity to the emperor before the imperial missus or representative. Eugenius held a council at Rome, in which, among other things, it was decreed that in every episcopal residence, as well as in every country parsonage, there should be a master for teaching the people and explaining the Scriptures. Eugenius died in 827, and was succeeded by Valentinus, who, dying also after a few weeks, was succeeded by Gregory IV.

EUGENIUS III., a native of Pisa, of the Cistercian order, and a disciple of St. Bernard, succeeded in 1145 Lucius II., who had died of a blow from a stone inflicted in a riot of the Roman people. Arnaldo da Brescia was then preaching his reform at Rome, the senate had declared itself independent of the pope, and Eugenius was obliged to take up his residence at Viterbo. After some fighting and many negotiations between the pope, assisted by the people of Tivoli, and the Romans, Eugenius repaired to France in 1147, and the following year held a council at Rheims. He afterwards returned to Italy in 1149, and with the assistance of Roger king of Sicily defeated the Romans, and entered the city. New disturbances however arose, which obliged him to take refuge in Campania, where he received of St. Bernard the book 'De Consideratione,' the subject of which was advice on his pontifical station and its duties. After having resided some time at Segni he made peace with the Romans, and returned to Rome in 1152. He died the following year, and was succeeded by Anastasius IV. It was under the pontificate of Eugenius III. that Gratianus, a Benedictine monk at Bologna, compiled his code of canon law called 'Decretum Gratiani,' which greatly favoured the extension of the papal power.

EUGENIUS IV., Gabriele Condulmero, a native of Venice, succeeded Martin V. in March 1431. His was a most stormy pontificate. He drove away the powerful family of Colonna, including the nephews of the late pope, from Rome, charging them with having enriched themselves at the expense of the papal treasury. Two hundred of their adherents were put to death, and the palaces of the Colonna were plundered; but their party collected troops in the country and besieged Rome. Eugenius, through the assistance of Queen Joanna II. of Naples, defeated the Colonna, and obliged them to sue for peace and surrender several towns and castles they held in the Roman state. He afterwards made war against the various lords of Romagna, who were supported by the Visconti of Milan; and he appointed as his general the patriarch Vitelleschi, a militant prelate, who showed considerable abilities and little scrupulousness in that protracted warfare, by which the pope ultimately recovered a considerable portion of territory. But as Vitelleschi intended to keep Romagna for himself, the pope had him put to death. The famous condottiere Sforza figured in all these broils. But the greatest annoyance to Eugenius proceeded from the council of Basel, which had been convoked by his predecessor, and which protracted its sittings year after year, broaching doctrines very unfavourable to papal supremacy. After solemnly asserting the superiority of the council over the pope, it forbade the creation of new cardinals, prohibited appeals from the council to the pope, suppressed the annates, or payments of one year's income upon benefices, which were a great source of revenue to the papal treasury, and made other important reforms. Eugenius, who had been obliged to escape from Rome in disguise on account of a popular revolt, and had taken up his residence at Bologna in 1437, now issued a bull dissolving the council, recalling his nuncio who presided at it, and convoking another council at Ferrara. Most of the fathers assembled at Basel refused to submit, and summoned the pope himself to appear before them, to answer the charge of simony, schism, and others; and after a time proceeded against him as contumacious, and deposed him. Eugenius meanwhile had opened in person his new council at Ferrara, in February 1438, in which, after annulling all the obnoxious decrees of the council of Basel, he launched a bull of excommunication against the bishops who remained in that assembly, which he characterised as a "satanic conclave, which was spreading the abomination of desolation into the bosom of the church." The Catholic world was divided between the two councils; that of Basel proceeded to elect a new pope in the person of Amadeus VIII. of Savoy, who assumed the name of Felix V., and was solemnly crowned at Basel. The council of Ferrara in the meantime afforded a novel sight. The Emperor John Paleologus II. came with Joseph, patriarch of Constantinople, and more than twenty Greek bishops, attended by a numerous retinue, and took his seat in the assembly. The object was the reconciliation of the eastern and western churches, which Eugenius had greatly at heart, and to which Paleologus was also favourably inclined, as he wanted the assistance of the powers of western Europe against the Turks. The plague having broken out at Ferrara, the council was removed to Florence. After many theological disputations on the subject of the Holy Ghost, of the primacy of the pope, of purgatory, and other controverted points, the decree of reunion of the two churches was passed, and signed by both parties in July 1439. The emperor and patriarch returned to Constantinople highly pleased with Eugenius; but the Greeks took offence at the terms of the union, the schism broke out afresh, and the separation of the two churches has continued ever since.

A grave charge against Eugenius is, that he encouraged the Hungarians and Poles to break the peace they had solemnly sworn with the Turks, under pretence that their oaths were not valid

without the sanction of the pope; he even sent Cardinal Julian as his nuncio to attend the Christian army. The result was the battle of Varna, 1444, in which the Christians were completely defeated, and King Uladislaus of Poland and Cardinal Julian lost their lives.

Eugenius died at Rome in 1447, after a reign of sixteen years, and in the sixty-fourth year of his age. He left the church in a state of schism between him and his competitor Felix, his own states a prey to war, and all Christendom alarmed at the progress of the Turkish arms. In his last days he is said to have expressed himself weary of agitation, and to have regretted the loss of his former monastic tranquillity before his exaltation. He recommended peace and conciliation to the cardinals assembled round him. He was succeeded by Nicholas V., in favour of whom Felix V. soon after abdicated. The pontificate of Eugenius forms a stirring and interesting though painful period in the history of Italy and of the church. L'Enfant and Aeneas Silvius, afterwards pope, have written the history of the council of Basel. See also the general collections of the councils and Baluze's 'Miscellanies.'

EULER, LEONARD, a celebrated mathematician of the last century, was born on the 15th of April 1707, at Basel, in Switzerland; his father, Paul Euler, was the Calvinistic pastor of the neighbouring village of Riehen. He was a man remarkable for unostentatious piety, and imbued with a considerable knowledge of mathematics, which he had acquired under the tuition of James Bernoulli.

After being instructed by his father in analytical science, young Euler was sent to the university of Basel, in which John Bernoulli was at that time professor, and by his rapid progress and decided mathematical genius he so far gained the esteem of his teacher and of the sons, Nicholas and Daniel Bernoulli, that his father was easily dissuaded from his original intention of forming his son into a divine, and wisely allowed him to pursue unshackled the high distinctions then conferred by a profound scientific reputation.

A prize having been proposed by the French Academy of Sciences on the management of vessels at sea, the ambition of Euler, then only nineteen years of age, induced him to attempt an essay, which was received with considerable applause, though the prize was conferred on Bouguer, an old and experienced professor of hydrography.

The Academy of Sciences at St. Petersburg was then rising to a distinguished rank amongst similar institutions in Europe under the fostering patronage of Catharine I., who had invited several philosophers to her capital, among whom were the Bernoullis above mentioned. On the retirement of Daniel Bernoulli, Euler was appointed professor of mathematics under Peter I. in 1733; soon after which he married a Swiss lady named Gsell, by whom he had a numerous family.

His works previous to the date at which we have arrived were, with few exceptions, confined to those mathematical questions arising from the progressive march of the Integral Calculus, which, at that time, caused much emulation in different countries. In general, Euler was far more in his element in the abstruser parts of pure mathematics than in the applied; in many of the latter he was frequently conducted to paradoxical results.

In the memoirs of the Petropolitan Academy, 1729 and 1732, are found several of his memoirs on trajectories, tautochronous curves, the shortest line along a surface between two given points, and on differential equations; besides which he had published at Basel a physical dissertation on sound.

Euler found it convenient at this time to apply himself intensely to study, not more from his natural ardour for the sciences and the incentive of an increasing reputation than from the desire to avoid the political intrigues which, under a suspicious and tyrannical minister, then agitated Russia.

During this interval he published an excellent treatise on mechanics (Petersburg, 1736, 2 vols., 4to), a treatise on the theory of music, and one on arithmetic, together with numerous papers in the Petersburg Memoirs, chiefly on astronomical and purely mathematical subjects, among which are contained his views on the solution of Isoperimetrical Problems, which embodied the profoundest researches on a matter of great analytical difficulty previous to the discovery of the Calculus of Variations by Lagrange. Upon the fall of Biren he gladly accepted an invitation from the King of Prussia to visit Berlin. When he was introduced to the queen-dowager in 1741, she was so much struck with the paucity of his conversation that on requiring an explanation, he replied that he had just returned from a country where those who spoke were hanged.

The princess of Anhalt-Dessau, being desirous to profit by the presence of Euler in Berlin, requested to be favoured with instructions on the known facts in the physical sciences. To this wish he fully acceded on his return to St. Petersburg in 1766, by publishing his celebrated work, 'Letters to a German Princess' (3 vols., 8vo, 1768); in which he discusses with clearness the most important truths in mechanics, optics, sound, and physical astronomy, having published previous to this date several isolated treatises and some hundred memoirs touching on every known branch of theoretical and practical mathematics. During his residence in Prussia he was much employed by the enlightened monarch who then governed that kingdom in questions connected with the mint, with navigable canals, &c. In the midst of such varied employments he was not forgetful of the

ties which bound him to his native home; having learned his father's death, he went in 1750 to Frankfurt to receive his widowed mother, and brought her to Berlin, where she lived until 1761, enjoying with a mother's feeling the glorious distinction to which her son by his talents and indefatigable industry had arrived.

An incident which occurred in 1760 showed how highly Euler was in general esteemed. The Russians having entered Brandenburg, advanced to Charlottenburg, and plundered a farm which belonged to Euler. When General Tottleben was informed who the proprietor was, he ordered immediate reparation to be made to an amount far above the injury, and the Empress Elizabeth presented him with 4000 florins.

In consequence of his unceasing application to study, Euler had the misfortune to lose the sight of one eye in 1735, and in 1766 that of the other; he however continued his valuable researches, some of his family acting as amanuensis, and his powers of memory are said to have been wonderfully increased even in his old age. He accepted the invitation of the Empress Catharine II. of Russia to return to St. Petersburg in 1766, where he would have fallen a victim to an accidental fire which destroyed his house and property in 1771, but for the courageous efforts of a fellow-countryman (M. Grimon), who bore the old man away in his arms. His manuscripts were saved by the exertions of Count Orloff.

On the 7th of September 1783, after some calculations on the motions of balloons, then newly invented, Euler dined with Lexell, and conversed on the lately-discovered planet Herschel. While playing with his grandchild, who was taking tea, he expired suddenly and without pain.

Euler was twice married in the same family, and had many children and grand-children; his habit of life was strictly religious, the labours of each day being closed with a chapter from the Bible and family prayer. A catalogue of his published and unpublished writings is given at the end of the 2nd volume of his 'Institutiones Calculi Differentialis,' 1787; and to the first is prefixed an eloquent Eloge by Condorcet.

Every useful subject of mathematical research engaged at some time the attention of Euler; and for relaxation he amused himself with questions of pure curiosity, such as the knight's move in chess so as to cover all the squares. His various researches have gone far towards creating the geometry of situation, a subject still imperfectly known. The following is one of the questions which Euler has generalised:—'At Königsburg, in Prussia, the river divides into two branches, with an island in the middle, connected by seven bridges with the adjoining shores; it was proposed to determine how a man should travel so as to pass over each bridge once and once only.'

The memoirs of Euler are principally contained in the following works:—'Comment. Acad. Petrop.,' 1729-51; 'Novi Comment. Acad. Petrop.,' 1750-76; 'Nova Acta Acad. Petrop.,' 1777-81; 'Mem. de l'Acad. des Sciences,' 1766-78; 'Recueil de l'Acad.,' 1727, &c.; 'Miscell. Berol.,' tom. vii.; 'Mem. de l'Acad. de Berlin,' 1745-67.

EUMENES, of Cardia, a town in the Thracian Chersonese, was an important actor in the troubled times which followed the death of Alexander the Great. [ALEXANDER III.; ANTIPATER; ARRHIDEUS; PERDIOCAS.] Being early taken into the service of Philip of Macedon, he served him for seven, and Alexander for thirteen years, in the confidential office of secretary. He also displayed great talent for military affairs through the Persian campaigns, and was one of Alexander's favourite and most esteemed officers. After Alexander's death, in the general division of his conquests, Cappadocia, Paphlagonia, and the coast of the Euxine as far as Trapezus, fell to the share of Eumenes. This was an expectancy rather than a provision, for the Macedonian army had passed south of these countries in the march to Persia, and as yet they were unsubdued. Perdioxas however took arms to establish Eumenes in his new government, and did so at the expense of a single

Antipater, who made a new allotment of the provinces, in which Eumenes was omitted, and Cappadocia given to another. The task of reducing him was assigned to Antigonus, about B.C. 320. The rest of his life was spent in open hostility or doubtful alliance with ANTIGONUS, into whose hands he was at length betrayed, and by whom he was put to death, B.C. 315, as is related in that article, vol. i., col. 238. Eumenes was an admirable partisan soldier, brave, full of resources, and of unbroken spirits. Those parts of Diodorus Siculus (book xviii.) which relate to him, and Plutarch's 'Life,' will be read with pleasure by those who are fond of military adventure. Plutarch ('Life of Eumenes,' c. ii.) speaks of some of his letters. The reader may also consult also Droysen, 'Geschichte der Nachfolger Alexanders,' Hamburg, 1836.

EUNAPIUS, a Byzantine historian and sophist, was born at Sardes, in Lydia, A.D. 347. He began his studies under Chrysanthius the Sophist, by whose advice he is said to have composed the lives of some philosophers and physicians. In his sixteenth year he left Asia for Athens to attend the lectures of Proeresius, by whom he appears to have been subsequently treated with the utmost kindness. After attending Proeresius for five years he meditated a journey to Egypt, in imitation, as Hadrian Junius says, of Plato and Eudoxus: this intention however he was prevented from fulfilling. He practised medicine with considerable repute, and distinguished himself by ardent Neoplatonism, and a vehement antipathy to Christianity. Besides his biographical works, he wrote a continuation of Dexippus's history, from the reign of Claudius Gothicus, where he quitted it, to the year 404. All that remain of his historical works are contained in the edition of the 'Byzantine Historians' by Niebuhr and Bekker, vol. i. [BYZANTINE HISTORIANS.] There is a complete edition of the works of Eunapius by Boissonade in 2 vols. 8vo, Amsterdam, 1822, with Wytenbach's notes, and a life by Hadrian Junius. (See Photius, codd. 77, 219; Suidas, under the word 'Ἐκαστατικός'; and Eunapius in his life of 'Proeresius'.)

EUNOMIUS, one of the chiefs of the Arian sect during the greater part of the 4th century, was a native of the town of Dacora in Cappadocia, and at first was a lawyer. It is said that he also followed for some time the military profession. He then became a disciple of Arius, under whom he very successfully studied the doctrinal theory of Christianity as understood by the Anti-Trinitarians. At Antioch he was ordained a deacon, and about 360 was elected Bishop of Cyzicum. The divinity of Christ was at this period the all-absorbing subject of ecclesiastical controversy. The Trinitarians contended for the Athanasian or Homoousian doctrine (from *ὁμοούσιος*, 'of the same essence'), against the Semi-Arians, who held the Homoiousian doctrine (from *ὁμοιούσιος*, 'of the like essence'), and against the doctrine of the Anomoeians (from *ἀνομοίος*, 'of a different essence'). In defence of the Anomoeian theory, or as it is by some called the Eunomian—Eunomius being asserted to have originated it—or that of unmodified Arianism, Eunomius exerted a high degree of natural abilities, asserting the impossibility of two principles in a simple substance, one of which is generated from the other, and exhibits the relation of a son to his father. The divine essence, he said, is necessarily characterised by oneness and indivisibility; the persons of the Godhead, like the divine attributes of wisdom, justice, mercy, &c., are merely names of ideal distinctions of the one Supreme Essence, as considered in its different relations with exterior objects; and it is contradiction and manifest absurdity to suppose this simple essence to consist of a plurality of principles or parts. In reply to these psychological subtleties, the advocates of the Trinitarian doctrine alleged the total incomprehensibility of the nature of God. (St. Basil, 'Epist.,' 166; St. Chrysostom, 'De Incomprehensibilitate Dei Naturæ.') Eunomius still acknowledged a father, son, and holy spirit, but the father as supreme, eternal, and distinct; the son as generated from the father, and the holy spirit as generated from the son. In the ceremony of baptism he dipped only the head and shoulders, regarding the lower parts of the body as disreputable, and unworthy of immersion in the holy water; and it is said he taught that those who faithfully adhered to his own theory of Christian doctrine might commit any degree of sin without incurring the danger of perdition; but this is probably a misrepresentation by his opponents, who also accuse him of being an Antinomian, that is, one of those who reject the Mosaic law. (Theodoret, 'Hæret.,' l. 4, c. 3; St. Augustin, 'De Hæres.,' Epiphanius, 'Hæres.,' 76; Baronius, 'ad an.,' 356.) Eunomius experienced a great severity of persecution without swerving in any degree from the Arian tenets with which he commenced his career. He was thrice banished from his episcopal see; first, by Constantius to Phrygia; then by Valens to Mauritania; and lastly, by Theodosius to the island of Naxos; however, he died in peace, at a very advanced age, in the year 394. Most of his works are lost, including a copious commentary on the 'Epistle to the Romans' in 7 vols., and numerous letters. Two of his principal treatises are printed in the 'Bibliotheca Græca' of Fabricius in Greek and Latin (tom. 8, pp. 235-305):—'A Confession of Faith,' presented in 383 to the Emperor Theodosius; and an 'Apologetic Discourse' in 28 chapters. (Cave, *Prim. Christianity*, part 2, c. 11; Pluquet, *Dict. de Hérétiques*; Broughton, *Historical Dict.*; Dr. A. Clarke, *Succession of Sac. Lit.*, vol. i., p. 318; Beza, in *Canisius*, l. 172.)

EUPHRA'NOR, of the Isthmus of Corinth, or the Isthmian, as Pliny terms him, was one of the most celebrated of the ancient Greek

Coin of Eumenes.

British Museum. Actual size. Silver. Weight 265 grains.

battle. To Perdioxas as regent, and after his death to the royal family of Macedon, Eumenes was a faithful ally through good and evil; indeed he is the only one of Alexander's officers in whose conduct any appearance of gratitude or disinterestedness can be traced. When war broke out between Ptolemy and Perdioxas (B.C. 321), he was appointed by the latter to the chief command in Asia Minor between Mount Taurus and the Hellespont (Cor. Nep., c. 3), to resist the expected invasion of Antipater and Craterus. He defeated Craterus; but the death of Perdioxas in Egypt threw the balance of power into the hands of

artists; he was the contemporary of Apelles and Praxiteles, and flourished during the second half of the 4th century before Christ, from about B.C. 360 to 320. He was equally celebrated as painter and as statuary, and, says Pliny, was in all things excellent, and at all times equal to himself. Euphranor, continues Pliny, was the first to represent heroes with dignity; and first used symmetry, where symmetry probably means as much a general keeping of design as correctness of proportions. One peculiarity of his design was a large and muscular limb in proportion to the body. It was this character of his figures probably, as well as colour, that he alluded to, when he said, in reference to two pictures of Theseus by Parrhasius and by himself, that his own had fed upon beef, while that of Parrhasius had been fed upon roses: the picture of Euphranor probably resembling more nearly the figure of a Greek athlete, while that of Parrhasius was more in accordance with the ideal form of a divinity, as we find them expressed in the Theseus of the Parthenon and the Apollo Belvedere respectively, and in many other Greek statues. [PARRHASIUS.] There are notices of many of Euphranor's works both in painting and in sculpture. He painted in encaustic. There were three noble pictures by him at Ephesus—a group of philosophers in consultation, clothed in the pallium; a general sheathing his sword, probably a portrait; and the feigned insanity of Ulysses. His most celebrated works however were a picture of the 'Twelve Gods,' and a 'Battle of Mantinea,' painted in the Ceramicus at Athens. The latter was painted, according to Plutarch, with a degree of inspiration; it represented Gryllus, the son of Xenophon, at the head of some Athenian horse, defeating the Boeotians under Epaminondas, who is said to have been slain by Gryllus: Plutarch, Pliny, and Pausanias call it a cavalry fight: it took place B.C. 362. Euphranor's most celebrated work in sculpture was a statue of Paris, which was praised, says Pliny, for showing at the same time the judge of the goddesses, the lover of Helen, and even the slayer of Achilles. Pliny mentions also several statues by Euphranor, which were at Rome. He left writings on symmetry and on colours. (Pliny, *Hist. Nat.*, xxiv. 8, 19; xxv. ii. 40; Quintilian, *Inst. Orator.*, xii. 10, 3; Plutarch, *De Glor. Athen.*, 2; Pausanias, i. 8; Eustathius, *Ad Iliad.*, i. 529; Valerius Maximus, viii. ii. 5.)

EUPOLIS, a writer of the old comedy, was born at Athens about the year B.C. 446 (Clinton's 'Fasti Hellenici,' ii. p. 63), and was therefore a contemporary of Aristophanes, who was in all probability born a year or two after. The time and manner of his death are involved in great obscurity. It is generally said that he was thrown overboard by the orders of Alcibiades, when that general was on his way to Sicily in B.C. 415, because Eupolis had ridiculed him in his comedy of the 'Baptæ;' but this story, which is sufficiently improbable in itself, was refuted by Eratosthenes, who brought forward some comedies which he had written subsequently to that period (Cicero, 'ad Attic.' vi. 1); besides, his tomb was, according to Pausanias (ii. 7, 3), on the banks of the Asopus, in the territory of the Sicyonians. Another account states that he fell in a sea-fight in the Hellespont, and that he was buried in Ægina. We have the names of twenty-four of his plays, but no adequate specimens of them. To judge from the titles, the object of Eupolis must have been, in almost every case, mere personal satire. The 'Maricas,' which appeared in B.C. 421 was an attack upon Hyperbolus, the demagogue; the Autolyous (B.C. 420) was intended to ridicule a handsome paucratist of that name, who is the hero of Xenophon's 'Symposium;' the 'Lacedæmonians' was directed against the political opinions of Cimon; and the object of the 'Baptæ' was to ridicule Alcibiades for taking part in the obscene rites of Cotytta. (See Buttmann's 'Essay on the Cotytta and the Baptæ, Mythologus,' ii. p. 159, &c.) Aristophanes and Eupolis were not upon good terms. Aristophanes speaks very harshly of his brother poet in the 'Clouds' (551, &c.), and charges him with having pillaged from 'The Knights' the materials for his 'Maricas;' and Eupolis in his turn made jokes on the baldness of the great comedian (Schol. on 'The Clouds,' 532). Eupolis published his first play when he was only seventeen years old (Suidas).

EURIPIDES of Athens is said to have been born at Salamis in the year B.C. 480, on the day of the great victory obtained over the fleet of Xerxes. His father Mnecarchus and his mother Clito were among the refugees driven to Salamis by the progress of the invading army. They seem to have been Athenian citizens of the poorer class, as we find that the mean occupation of this poet's mother was made by Aristophanes one of the standing subjects of the ridicule which he so perseveringly heaped upon him. Philochorus, on the contrary, says that he was of noble birth; but still his parents might be poor. (Suidas, *Europides*.) Euripides however found means to devote himself early and closely to the study of philosophy in the school of Anaxagoras, as well as to that of eloquence under Prodicus. While he was yet very young, the persecution and banishment of Anaxagoras appear to have deterred him from the cultivation of philosophy as a profession, and combined with the strong natural bent of his genius to have directed his exertions chiefly to dramatic composition. He is said to have commenced writing at the age of eighteen; and in the course of a long life he composed not fewer than seventy-five, or, according to other authorities, ninety-two tragedies, which rivalled in the public approbation the contemporary productions of Sophocles; and notwithstanding the constant and bitterly satirical attacks which,

in the author's own time, they sustained from such as were exclusively and intolerantly attached to the elder tragic school, they secured him for all succeeding ages a place beside its two great masters. When upwards of seventy years old, weary, it should seem, of the feverish excitement in which he must have been kept alike by the petulant criticism and the turbulent applause that attended him at Athens, he accepted the invitation of Archelaus, king of Macedonia, and went to live in honoured and tranquil retirement at his court. Here however a singular as well as a tragical end awaited him. According to one account (for, in this as in many other matters of ancient biography, there are discrepancies), he had spent three years in this retreat, when walking one day in a solitary spot, he was met by some of the king's hounds, which, rushing furiously upon him, tore him so violently that he died in consequence of the laceration. Aulus Gellius tells us that the Athenians sent to Macedonia to ask for the body of Euripides, but that the Macedonians constantly refused it, in order that their own country might retain the honour of the magnificent tomb which they erected for him at Pella, and which, according to Ammianus Marcellinus, was sanctified by the thunder-stroke, as Plutarch informs us had been the case with Lycurgus. Thus Athens was obliged to content herself with engraving the name of Euripides upon an empty monument, which in the time of Pausanias was yet standing beside the road from the Piræus to Athens (Pausan., 'Attic.' 1, 2), near the tomb of Menander.

Of the numerous tragedies of Euripides, nineteen survive—a much larger proportion than has descended to us of the works of either of the two elder tragic masters. We may point out his 'Electra' to the reader's attention, not as a favourable specimen of the general powers of Euripides—for indeed, as a work of art it is decidedly one of the least meritorious of his extant pieces—but as affording the clearest point of comparison between his most prominently distinctive features as a dramatist and those of his two great predecessors; this being the only instance in which we have a piece from each of the three composed upon one and the same historical or mythological subject. 'Orestes,' the subject of which, inasmuch as it relates to the persecution of that hero by the furies of his mother and his proscription as a matricide, is the same as that of the 'Eumenides' of Æschylus, though in scene, incident, and character, excepting that of Orestes himself, they are wholly different, is more vigorous and more affecting than the 'Electra.' 'Iphigenia in Tauris' and 'Andromache' follow out still farther the fortunes of Orestes; both rank among those pieces of the second order in which the highest praise can be given only to certain portions. The same may be said of the six following pieces: the 'Troades,' the mournfully grand conclusion of which exhibits the captive Trojan women leaving Troy in flames behind them; 'Hecuba,' relating to the subsequent history of the captive queen; the 'Hercules Furens,' or 'Raging Hercules;' the 'Phœnissæ,' having the same historical groundwork as the 'Seven against Thebes' of Æschylus; the 'Hæclicidæ,' which celebrates the Athenian protection of the children of Hercules, ancestors of the Lacedæmonian kings, from the persecution of Eurystheus; and the 'Suppliants,' which in like manner commemorates the interment of the Seven before Thebes and their army, effected, on behalf of Adrastus king of Argos, by a victory of the Athenians over the Thebans. 'Helen' is a very entertaining and singular drama, full of marvellous adventures and appearances, being founded on the assertion of the Egyptian priests that Helen had in fact remained concealed in Egypt, while Paris had merely carried off an airy semblance of her. The genuineness of 'Rhesus,' taken from the eleventh book of the 'Iliad,' has been much disputed, chiefly on the ground of its great relative inferiority—an argument which is outweighed by certain internal characteristics of the piece itself, combined with the external testimony of the ancient writers ascribing it to Euripides. For beautiful morality and unaffected yet overpowering pathos, his 'Ion,' his 'Iphigenia in Aulis,' and above all, his 'Alcestis,' are peculiarly distinguished. He found subjects especially suited to the development of his finer powers in the purity and sanctity of the youth from whom the first of these three tragedies is named, in the unsuspecting innocence of the heroine of the second, and in the tender yet resolute devotedness of conjugal affection portrayed in the third. The 'Hippolytus' and the 'Medea,' exhibiting all the romantic violence of irregular and vehement feminine passions, are deservedly celebrated among the greatest and most thoroughly successful achievements of this dramatist. After the 'Hippolytus,' Schlegel is disposed to assign the next place among all the remaining works of Euripides to the 'Bacchæ,' on account of its harmonious unity, its well-sustained vigour, and of the appropriateness to the very peculiar subject here treated, of that luxuriance of ornament which Euripides constantly displays. This piece also merits especial attention as being the only one remaining of the 'serious' dramas that were composed expressly and immediately in honour of Bacchus himself, the patron deity of the theatre. In this instance the glory and the power of Bacchus are not merely the occasion—they form the subject of the tragedy; and the wildly picturesque chorus of Bacchantes, as Schlegel observes, "represent the infectious and tumultuous inspiration of the worship of Bacchus with great sensual power and vividness of conception."

An interest yet more peculiar attaches to the 'Cyclops,' as being the sole remaining specimen of the 'satyrical' tragedy, so called from the chorus of satyrs, which formed an essential part of its composition.

This therefore seems to be the fittest place in which to give a brief account of that particular and somewhat remarkable dramatic species. From this piece itself and from all collateral evidence, it is to be inferred that the satyric drama was never acted but as a kind of shorter and lighter after-piece, to relieve the minds of the audience, especially the ruder portion of them, after the grave impression of the serious performances: for which purpose however it seems to have been very constantly employed, each tragic trilogy being almost invariably accompanied by one of these shorter and lighter productions. Thus we find mention made of five satyric pieces of *Æschylus*, seven or eight of *Sophocles*, five of *Euripides*, besides a number of others by various minor authors. Notwithstanding its burlesque ingredients, the tragic character was so far preserved in the satyric play, that the subject appears to have been always historical, and the action partly serious, though with a fortunate catastrophe. No less than tragedy and comedy, the satyric drama had its peculiar and appropriate stage decorations, representing woods, caves, mountains, and other diversities of the sylvan landscape. Satyrs old and young, with *Silenus* in his various ages, were distinguished from one another by the variety of their grotesque masks, crowned with long shaggy goats' hair; while the satyrs were negligently clad in skins of beasts, and the *Sileni* decorated with garlands of flowers skilfully woven. The satyr parts too appear to have been sometimes acted by pantomimic performers moving on a kind of stilts, to give more completely the appearance of goats' legs. The choral dance, it is hardly necessary to remark, was thoroughly rustic, peculiarly lively, and quite opposite in character to the solemn and impressive movements which accompanied the serious tragedy. The piece of *Euripides* has for its subject the adventure of *Ulysses* with *Polphemus*, as related in the 'Odyssey,' with the addition of *Silenus* and his satyr band; the characters are accurately discriminated and consistently maintained; and the nature of the plot produces such natural contrasts and even blendings of the ludicrous with the horrible, as above all things else, render this drama unique among the Grecian remains.

The editions of *Euripides* are numerous. The first edition, that of *J. Laekaris*, Florence, near the close of the 15th century, contains only the 'Medea,' 'Hippolytus,' 'Alceste,' and 'Andromache.' That of *Aldus*, Venice, 1503, contains seventeen plays, among which is the 'Cyclops.' Among subsequent editions are those by *Canter*, Antwerp, 1571; *Barnes*, Cambridge, 1694; *Musgrave*, Oxford, 1778; *Beck*, Leipzig, 1778-1788. The last complete editions are by *Aug. Matthiæ*, Leipzig, 1818-29, in 9 vols., a variorum edition in 9 vols., Glasgow, 1825, and that by *F. H. Bothe*, Leipzig, 1825. The editions of separate plays are also numerous; among which that of the 'Hecuba,' 'Orestes,' 'Phonissæ,' and 'Medea,' by *Porson*, is the best known. *Euripides* has been translated into German by *F. H. Bothe*, and into English by *Potter*. There are also translations in German of several of the separate plays.

EUSEBIUS PAMPHILI, Bishop of *Cæsarea*, in Palestine, the friend of *Constantine*, and one of the most distinguished among the earlier Christian writers, was born in Palestine towards the end of the reign of *Gallienus*, about 264. He passed the earlier part of his life at Antioch, and acquired a great reputation for learning; it was said of him "that he knew all that had been written before him." He became intimate with *Pamphilus*, bishop of *Cæsarea*, who suffered martyrdom under *Galerius* in the year 309, and in memory of whose friendship he added to his name that of *Pamphilus*. In 313 he was himself raised to the see of *Cæsarea*, which he filled until his death. He attended the great council of *Nicaea* in 325, where he joined his brethren in condemning the tenets of *Arius*; but he is said to have raised some objections to the word "consubstantial with the Father" as applied to the Son, in the *Nicaean* creed. His intimacy with his namesake *Eusebius*, bishop of *Nicomedia*, who openly espoused the cause of *Arius*, led him also to favour the same, and to use his influence with the emperor for the purpose of reinstating *Arius* in his church, in defiance of the opposition of *Athanasius*. [*ARIUS*; *ATHANASIUS*.] The party to which he attached himself were called *Eusebians*, from their leader, *Eusebius* of *Nicomedia*; and they seem to have acted in great measure from hostility against *Athanasius* and his supporters, as they did not as yet openly advocate the objectionable tenets of *Arius*, who had himself apparently submitted to the decrees of the council of *Nicaea*. In 331 *Eusebius* attended a council at Antioch, consisting of prelates of this party, who deposed, on some insidious charge, the bishop *Eustathius*, a zealous supporter of the *Nicaean* doctrine, and offered the see of Antioch to *Eusebius* of *Cæsarea*, which he declined. At the council of Tyre, in 335, *Eusebius* joined in condemning and deposing *Athanasius* on the charges of disobedience to the emperor in not reinstating *Arius*, want of respect to the council, and an alleged desecration of some sacred vessels. *Eusebius* was deputed by the council to defend before *Constantine* the judgment which they had passed against *Athanasius*, and he appears to have used his influence with the emperor to have *Athanasius* banished. The part which he took in this unfortunate controversy caused him to be stigmatised as an *Arian*, though it appears that he fully admitted the divinity of *Christ*; and all that his accusers can prove is, that in his earlier writings he asserted his belief that there was a certain subordination among the persons of the Trinity. *Eusebius* of *Cæsarea* died in 340.

Eusebius was possessed of most extensive erudition, sacred as well

as profane, and he was one of the warmest defenders and expounders of Christianity. His principal works are:—1. The 'Ecclesiastical History,' in ten books, from the advent of our Saviour to the defeat of *Licinius* by *Constantine* in 324. *Eusebius* has been styled the father of ecclesiastical history. He is silent on the subject of the *Arian* controversy, although it had begun at the time when he ends his narrative. Upon the whole, his history is written with considerable discrimination and impartiality. 2. 'De Preparatione Evangelicâ,' in fifteen books. In this work he examines the various systems of theology and cosmogony of the ancient philosophers, the purest part of which, he maintains, was borrowed from the Jewish sacred writings. Among the writers whom he quotes, and whose works are now lost, are the Phœnician *Sanchoniatho* and the Egyptian *Manetho*. From the aberrations of the heathens and the speculations of the philosophers he draws arguments in favour of the truth of the Christian doctrines. This work of *Eusebius* was followed by another—3. 'De Demonstratione Evangelicâ,' in twenty books, of which only ten have come down to us. It consists of further proofs of the truth of the Christian faith, chiefly directed against the Jews, being drawn from the books of the Old Testament. 4. 'The Chronicle or Universal History,' was only known by fragments until it was discovered entire in an Armenian manuscript version, found at Constantinople, and published by *Zohrab* and *Mai* at Milan in 1818. The work is divided into two books: the first, entitled 'Chronography,' contains brief separate sketches of the history of the various nations and states of the old world, from the Creation till the year 325 of our era. The author gives extracts from *Berosus*, *Alexander Polyhistor*, *Abydenus*, *Cephalion*, *Manetho*, and other lost writers. The second book consists of synchronical tables, with the names of the contemporary rulers of the various nations and the principal occurrences in the history of each, from the age of *Abraham* till the time of *Eusebius*. The author has made use of the works of *Africanus*, *Josephus*, and others. The discovery of the Armenian copy of *Eusebius* has been a valuable acquisition, as it serves to correct several errors and to supply many deficiencies in chronology and ancient history. The other works of *Eusebius* are—5. 'Onomasticon Urbium et Locorum Sacre Scripturæ,' 6. 'The Life of *Constantine*,' in four books, a piece of panegyrical biography. 7. 'A Life of his friend *Pamphilus*,' of which only a fragment remains; and other minor works.

EUSEBIUS, Bishop of *Nicomedia*, was born about 324, and was related on his mother's side to the emperor *Julian*. Before he was made bishop of *Nicomedia* he had held the bishopric of *Berytus*, or *Beyrout*, in Syria. At the council of *Nicaea* he joined with *Eusebius* of *Cæsarea* in advocating moderate measures towards *Arius*; and he refused to sign the condemnation which the council issued against him; but he appended his signature to the orthodox creed promulgated by the council. Having shortly after more openly favoured the *Arian* doctrines, he was deposed from his bishopric and banished; but the influence of *Constantia*, the emperor's sister, who had embraced *Arian* views, speedily procured his recall and his restitution to his see. It was *Eusebius* of *Nicomedia* who was employed to administer baptism to *Constantine* in his last illness. He appears now to have openly taught the *Arian* tenets, which indeed were from him commonly styled *Eusebian*. He absolved *Arius* from the excommunication of the *Alexandrian* synod; and he exerted himself to procure, by means of synods specially called for the purpose, the restoration of *Arius* to the full privileges of church communion. [*ARIUS*.]

On the death of *Alexander* bishop of Constantinople, the great opponent of the *Arians*, 339, *Eusebius* procured himself, contrary to the canon, to be named his successor, and he obtained for the *Arians* permission to celebrate public worship at Alexandria and elsewhere. He died in 342. The character of *Eusebius* has come down to us in a very unfavourable light: not merely is he represented as heterodox in doctrine, but as worldly, selfish, and dishonest in conduct. But we must remember, that, regarded as the most important advocate and patron of the *Arian* heresy, he was the object of abhorrence on the part of the orthodox, on whose notices of him we are alone dependent, and it is only fair therefore to give him the benefit of any doubt which a critical reading of their narratives may suggest. As we have seen, during his life, and for some time subsequently, the followers of *Arius* were called indifferently *Arians* and *Eusebians*; but when the party became divided, those who held what were called *Homoiousian* views in opposition to strict *Arianism*, quoted *Eusebius* as their authority; and it was the doctrines of this *Eusebian* section which was sanctioned by the council of *Seleucia* in 359, and the synods of *Arles* and *Milan*. [*ARIUS*.]

EUSEBIUS, BISHOP OF *EMESA* in Phœnicia, was born about the end of the 3rd century in the neighbourhood of *Edessa*, and belonged to a very illustrious family. He was from his early youth instructed in the principles of the Christian religion, and had the most distinguished teachers of the time. He afterwards devoted himself to the study of theology under the direction of the celebrated *Eusebius* of *Cæsarea* and *Patrophilus* of *Seythopolis*. However as he wished to avoid being appointed to any ecclesiastical office too early, he went to Alexandria to spend some time in the study of philosophy. On his return from Alexandria he stayed for awhile at Antioch, and formed an intimate friendship with *Flaccilius*, the bishop of that place. In 341 *Athanasius* was deprived by the Synod of Antioch of his bishopric

of Alexandria, and Eusebius, to whom it was offered, refused it, though soon after he accepted the bishopric of Emesa. During the solemnity of his ordination the people of Emesa rose against him, charging him with pursuing mathematics and magic. Eusebius took to flight, and for a time he stayed with his friend Georgius, bishop of Laodicea, but afterwards he returned to Emesa, where he was tolerated, owing to the influence of his friend Georgius. He died at Antioch in 360. Eusebius was a great favourite of the Emperor Constantius, who is said to have been accompanied by him on several military expeditions. Some of his contemporaries charged him with favouring the Sabellian heresies, but Sozomen thinks that this accusation was suggested to his enemies only by their envy of his great virtues. Hieronymus even calls him the ringleader of the Arian party—a strong expression—which, from the pen of Hieronymus, must be taken with great caution; for, as far as we know, all that can be said is, that Eusebius had a leaning towards the views of the semi-Arians. Eusebius was a man of a very cultivated mind and great eloquence: he wrote a great number of works which were well received by his contemporaries, but all of them are lost with the exception of a few said still to exist in manuscript in some libraries. (Socrates, 'Hist. Eccles.' ii. 9; Sozomen, iii. 6; Hieronymus, 'De Scriptor.' 91; Nicephorus, ix. 5.) His life, written by his friend Georgius of Antioch, is lost. There exists, under the name of Eusebius, a collection of fifty homilies, which were published in a Latin translation by J. Gagneius, Paris, 1547 (reprinted at Paris, 1561, 8vo, and at Antwerp, 1555); but all critics agree that these homilies are the productions of a much later age than that of Eusebius of Emesa. (Cave, *Historia Literaria*, vol. i. p. 156, &c.; Fabricius, *Biblioth. Græc.*, vii. p. 412, &c.)

EUSTA'CHIUS. BARTOLOMEO EUSTACHIO, or EUSTACHIUS, was one of the distinguished band of Italian professors to whom we owe the restoration of anatomy and much of its advancement in modern times. He was born in the early part of the 16th century at San Severino, in the marquisate of Ancona. Having accomplished himself in the classical and Arabic languages, he studied medicine at Rome, and afterwards settled there with a view to practise as a physician, under the patronage of the celebrated Cardinal Borromeo. The interest he could thus command, and his unusual talents, were sufficient to elevate him to the chair of medicine in the Collegio della Sapienza; yet he never obtained any degree of professional success, and after a long struggle with poverty and sickness, died in great indigence about 1574.

It is not surprising that Eustachius should have failed as a practical physician, for the exclusive devotion with which he pursued his favourite study must have left him little time for the cultivation of the lucrative branches of his art; but the complete failure as a teacher, of a man of so much genius and enthusiasm, is remarkable. It may be attributed perhaps to the ascendancy of the rival school of Padua, supported by the wealth of Venice, and illustrated by the established fame of Vesalius and his successors; and may be due in part to a defective temper, of which some indications may be observed in his writings, and to the jealousy with which he concealed his discoveries. Eustachius published little in his lifetime, though he lived long and laboured much; yet his treatises, short and few as they are, and composed when anatomy was yet an infant science, are of high authority even at the present day, and bear witness to the accuracy and extent of his researches. They are all in Latin, and are nearly all collected in his 'Opuscula Anatomica,' published in 4to at Venice in 1564 by himself, and again by Boerhaave, Leyden, 1707, in 8vo. He also published an edition, with annotations, of Erotian's 'Lexicon Hippocraticum.' His principal work, 'On the Disputed Points of Anatomy,' upon which he evidently intended to rest his fame, was unpublished to the time of his death, although announced in the 'Opuscula,' probably for want of means; it was then lost, and has never been recovered; but thirty-nine copper-plates, engraved as early as 1552, and intended to illustrate the text of this work, were found at Urbino in 1712, and given to the world two years afterwards by Lancisi, with the aid of Morgagni, Pacchioni, and other anatomists of distinction. Several editions of them have since appeared with voluminous commentaries; the best is that of Albinus, published at Leyden in 1744 in folio, and reprinted in 1762. The importance attached to these plates, after so long an interval of oblivion, shows how much Eustachius must have preceded his age; and they prove that many facts of great importance in anatomy were accurately known to him, the partial re-discovery of which had shed lustre on a century and a half of subsequent inquiry.

Haller declares it to be impossible, without writing a treatise on the subject, to particularise the discoveries and corrections that Eustachius introduced into anatomy. The tube leading from the ear-drum to the throat, and a certain valvular membrane in the heart, which bear his name, are among the former.

EUSTA'THIUS, Archbishop of Thessalonica in the latter part of the 12th century, was one of the most learned scholiasts of his age. He wrote a commentary upon the 'Iliad' and the 'Odyssey,' which is a mine of ancient erudition, and contains extracts from the older commentators, such as Apion, Heliodorus, Demosthenes of Thrace, Porphyrius, and others. It was first printed at Rome in the edition of Homer, 4 vols. folio, 1542-48; the latest edition is that of Leipzig, 1827. Eustathius wrote likewise a Commentary on Dionysius Perie-

getes, or the Geographer, which was published by Robert Stephens in 1547, and often reprinted since. He also wrote a commentary on Pindar, which is lost. There are letters of Eustathius existing in manuscripts in several libraries, but they have never been published. The novel of 'Hysmine and Hysminias,' published at Paris in 1618, has been also attributed to Eustathius, but, as it is now proved, erroneously.

EUTO'CIUS, a Greek mathematician of Ascalon in Palestine, who flourished about 550. He was pupil of Isidorus, the architect who designed and chiefly built the celebrated church (now the mosque) of St. Sophia at Constantinople; and he became ultimately one of the most distinguished geometers of his time.

It was the general custom of mathematical and philosophical authors, during the decline of learning, to give their views and their discoveries, where they made any, in the form of commentaries on some earlier writer. Eutocius, like Proclus and others, delivered his views in this way; and, like them, he furnishes some valuable contributions to the history of mathematical science amongst the Greeks. The commentaries of Eutocius on the works of Archimedes and Apollonius are the only works by which he is known to modern readers. His commentaries on Apollonius were published in Halley's Oxford edition of the works of that author, 1710; and those on Archimedes in various editions, from that of Basel, 1544, to that of Oxford, 1792.

Of the commentaries of Eutocius, those on the treatise of Archimedes 'On the Sphere and Cylinder' are most valued; and chiefly for his account of the various modes of solving the Delian problem of the Duplication of the Cube. All of them however, though of less value both as to historical and geometrical matter, are still interesting to every one who takes a pleasure in investigating the history of pure science. The commentary on the 'Measurement of the Circle,' by Archimedes, was translated into German, together with the text of Archimedes to which it refers, by J. Gutenäcker, Würzburg, 1825 and 1828, 8vo.

EUTROPIUS, FLAVIUS, was a Latin historian of the 4th century. Little is known of his life: he was secretary to the emperors Constantine and Julian, and accompanied the latter in his unfortunate Parthian campaign. He is believed to have been of senatorial rank. He is known as the author of a compendium of Roman history, in ten books, from the foundation of the city down to the accession of Valens, A.D. 365, which, being short and easy, has been much used as a school-book. Meagre as it is—for it might be contained in 100 common-sized octavo pages—it is still of some use towards filling up those gaps in history which are left in consequence of the total loss of some writers and the imperfect condition in which others have come down to us. The best edition is said to be that of Haverkamp, Leyden, 1729, 12mo, improved by Versek, Leyden, 1762, 2 vols. 8vo. Among the most useful editions is that of Tzschucke, Lips. 1796.

EUTYCHES, the reputed founder of the Eutychieans, a sect of Christians which began in the East in the 5th century, though the opinions attributed to Eutyches are said to have existed before ('De Eutyochianismo ante Eutychem,' by Christ. Aug. Selig., and also Assemani, 'Bibliotheca Orientalis,' tom. i., p. 219.) Eutyches was a monk who lived near Constantinople, and had a great reputation for austerity and sanctity. He was already advanced in years when he came out of his retirement, A.D. 448, in order to oppose the Nestorians, who were accused of teaching "that the divine nature was not incarnate in, but only attendant on Jesus, being superadded to his human nature after the latter was formed;" an opinion however which Nestorius himself had disavowed. In his zeal for opposing the error ascribed to the Nestorians, Eutyches ran into the opposite extreme of saying that in Christ there was "only one nature, that of the incarnate Word," his human nature having been absorbed in a manner by his divine nature. Eusebius, bishop of Dorylæum, who had already opposed the Nestorians, denounced Eutyches before a council assembled at Constantinople by Flavianus, bishop of that city. That assembly condemned Eutyches, who, being supported by friends at the court of Theodosius II., appealed to a general council, which was soon after convoked by the emperor at Ephesus in 449, under the presidency of Dioscorus, bishop of Alexandria, and successor to the famous Cyril, who had himself broached a doctrine very similar to that of Eutyches. The majority of the council tumultuously acquitted Eutyches and condemned Flavianus; the bishops opposed to him were obliged to escape, and Flavianus was cruelly scourged by the soldiers; it was in short a scene of disgraceful violence, which earned for the council of Ephesus the name of 'a meeting of robbers.' Flavianus appealed to Leo the Great, bishop of Rome, who, in his answer, condemned the doctrine of Eutyches, but could not obtain of Theodosius the convocation of another council. After the death of that emperor, his successor, Marcianus, convoked a council at Chalcedon in 451, which is reckoned as the fourth œcumenical council of the Church, and which the pope's legates attended. By this assembly the acts of the council of Ephesus were annulled, Dioscorus was deposed and banished, and Eutyches, who had already been banished by the emperor, was again condemned, and deprived of his sacerdotal office. The doctrine was at the same time expounded that "in Christ two distinct natures are united in one person, and that without any change, mixture, or confusion."

Eutyches died in exile; but several monks, especially in Syria, continued the schism, and having found a protectress in the empress Eudocia, the widow of Theodosius, who was living in Palestine, they became more daring, and excited the people against the partisans of the council of Chalcedon, whom they stigmatised as Nestorians. The emperor was obliged to send troops to repress these disorders.

The doctrine of Eutyches was perpetuated in the East under certain modifications, or rather quibbling of words, which caused the sect to be subdivided under various names, all however comprehended under the general name of Monophysites, or believers in one nature. (Ammemani, 'De Monophysitis,' at the beginning of vol. ii. of his 'Bibliotheca Orientalis,' and Albuffragius's 'Argumenta' in favour of that doctrine in the same volume, pp. 288-89.) In the sixth century a fresh impulse was given to the Eutybian doctrine by one Jacob, a monk, surnamed Baradour, who reconciled the various divisions of the Monophysites throughout the East, and spread their tenets through Syria, Armenia, Mesopotamia, and Egypt, found supporters among several prelates (among others in the bishop of Alexandria), and died himself bishop of Edessa in 588. He was considered as the second founder of the Monophysites, who assumed from him the name of Jacobites, under which appellation they still constitute a very numerous church, equally separate from the Greek, the Roman or Latin, and the Nestorian churches. The Armenians and the Copts are Jacobites, and so are likewise many Syrian Christians in contradistinction to the Melchites, who belong to the Greek Church. Jacobite congregations are found in Mesopotamia.

The Monothelites who appeared in the 7th century have been considered as an offshoot of the Eutybian or Monophysites, though they pretended to be quite unconnected with them. They admitted the two natures in Christ, explaining that after the union of the two into one person there was in him only one will and one operation. This was an attempt to conciliate the Monophysites with the Orthodox Church, and it succeeded for a time. It was approved of by many eastern prelates, and even by Pope Honorius I., in two epistles to Sergius, patriarch of Constantinople, which are found in the Acts of the Councils. But the successors of Honorius condemned the Monothelites, and Martin I., in a bull of excommunication, 649, consigned them and their patrons (meaning the Emperor Constantine, who protected them) "to the devil and his angels." Constantine, indignant at this, caused his exarch in Italy to arrest Martin, and send him prisoner to the Chersonesus. At last, under Constantine, who succeeded Constantine, the council of Constantinople, which is the sixth oecumenical council, in 680, condemned the Monothelites, and with them Pope Honorius himself.

EVAGORAS, king of Salamis in the island of Cyprus, from A.D. 410 to 375. His family, the Teucridæ, had been deprived of the government of Salamis by a Phœnician, Abdymon, who, with the view of securing himself against the Greeks, placed his usurped kingdom under the protection of Persia, and promised to reduce the whole island under the Persian dominion. During the reign of the usurper, Evagoras spent his boyhood at Salamis without being molested; but when the usurper had been murdered by one of the Cyprian nobles, Evagoras fled to Soli in Cilicia, for the murderer, in order to secure the throne to himself, was anxious to get rid of Evagoras also, who was then a very promising youth, and distinguished for his intellect as well as bodily strength. Evagoras now resolved to recover the kingdom of his ancestors, and, accompanied by a band of fifty faithful friends, he made a descent upon Cyprus, defeated his enemies, and fully accomplished his object, A.D. 410. Isocrates, to whom we are chiefly indebted for our knowledge of the history of Evagoras, describes him as a man of great talent as an administrator: he restored the fortifications and the harbour of Salamis, built ships, and endeavoured to establish commerce; but his great ambition seems to have been to establish Greek manners and literature in his kingdom. Hence many a Greek exile, especially Athenian, found a welcome reception there; and Conon, after the battle of Egospotami, in A.D. 405, was most hospitably received by Evagoras. But he could not hope permanently to improve the condition of his kingdom without previously securing himself against any attacks of the Persians. Through the mediation of Ctesias, the physician of Cnidus, a treaty was concluded between king Artaxerxes II. and Evagoras, in consequence of which Evagoras supported the Persians with money and ships in their war against Laocædemon, and was afterwards honoured by the Athenians with a statue and the Attic franchise. The friendly relation with Persia however did not last long, for Evagoras had enlarged his kingdom, partly by persuading the towns of Cyprus, and partly by force. This was against the interests of Persia; several towns solicited the protection of Artaxerxes, who was prevailed upon to declare war against his vassal. Hecatomnus, a dynast of Caria, received the command of the Persian fleet, and Autophrades that of the army; and according to some accounts Artaxerxes himself went to Cyprus, A.D. 391. Evagoras was supported by the Athenians with ships, and other friends advanced him money. But his small fleet was captured by the Spartan Telesitas, almost as soon as it had left the harbour of Salamis. Notwithstanding this misfortune the Persians made no progress, probably because Hecatomnus had already entered into a secret understanding with Evagoras. In the meantime Evagoras concluded an alliance with king Acoris of Egypt, and in A.D. 388 he received from the Athenians a fleet under the command of Cha-

brias. Thus strengthened, Evagoras in a short time made himself master of nearly all Cyprus, ravaged Phœnicia, and induced Cilicia to revolt against Persia. Artaxerxes, who had reason to dread the further progress of Evagoras, concluded a peace with the Spartan Antalcidas, A.D. 370, in which Cyprus was recognised as a province of the Persian empire. The Athenians accordingly recalled Chabrias and the fleet they had sent to the assistance of Evagoras, who nevertheless refused to submit to Persia, relying as he did on the aid of Acoris. Artaxerxes made great preparations for war; on the other hand Evagoras was not wanting either in courage or in the means of defending himself, and although the Persians landed an army in Cyprus, Evagoras contrived to cut off their supplies, which caused an insurrection in the Persian camp; and Evagoras, who had increased his fleet to 200 sail, ventured upon a sea-fight off Citium, but he was defeated, and lost many of his ships. Salamis was now blockaded by the Persians by land and by sea, but availing himself of the jealousies between the Persian commanders, and by entering on timely negotiations with Orontes, one of them, separately, he succeeded in protracting the war, till at the end of ten years, the war having lasted from A.D. 385 to 376, it was brought to a close very honourable to Evagoras. He did not long survive the conclusion of the peace, for in A.D. 374, being then at an advanced age, he was murdered by a eunuch whose wife had been seduced by a son of Evagoras. He had been married to Leto, by whom he was the father of a large family. He was succeeded by his son Nicoteles. (Isocrates, *Evagoras*; Diod., xiv. 39, 98, 110; xv. 2-9, 47; Photius, *Bibl. Cod.*, 176; Pausanias, i. 3, 2; Xenophon, *Hellen.*, iv. 8, 24; Aristotle, *Polit.*, v. 8; Lucian, *Pro Imag.*, 27.)

From this Evagoras we must distinguish another, who was likewise king of Salamis, and, so far as chronology is concerned, may have been either a son or grandson of the first Evagoras. He was deprived of his kingdom by one Protagoras, but recovered it in A.D. 350, with the assistance of Persia. Soon after however, some calumnies against him having been brought before the Persian king, he was expelled a second time by Protagoras. Evagoras indeed succeeded in justifying himself before the king, but instead of his principality he received a satrapy as a compensation. In consequence of his bad administration he was obliged to escape; he fled to Cyprus, but was overtaken and put to death. (Diodorus, xvi. 42, 46.)

EVAGRIUS, born at Epiphania, in Syria, about the year 536, practised as an advocate at Antioch, where he acquired a brilliant reputation. He was afterwards appointed quæstor, and filled other public offices. He wrote an ecclesiastical history in six books, beginning with A.D. 431, about the period where the histories of Socrates and Theodoretus terminate, and continuing to the year 593. Nothing is known of the personal history of Evagrius subsequent to the completion of his history about 594. His work is spoken of favourably by Photius. Evagrius, though not always to be trusted implicitly, yet shows greater discrimination than Socrates; he consulted the original documents, and appears to have been tolerably impartial. He was well acquainted with profane as well as ecclesiastical history. His work was published by Robert Stephens, and afterwards by Valois, Paris, 1679, in an improved edition founded upon two different manuscripts. It was published again with notes at Cambridge, 1720.

EVALD, JOHANNES, the most distinguished Danish poet of the 18th century, was born at Copenhagen, November 18th, 1743. His father, who was a clergyman in that city, possessed considerable theological attainments, but was prevented by ill health from acting as preceptor to his sons. Johannes therefore, the second and most gifted of the three, was shortly before his father's death (1754) sent to Sleswig, where his tutor left him entirely to his own choice of books for his leisure reading. Among these were translations of 'Robinson Crusoe' and 'Tom Jones,' the former of which so captivated his imagination that he proposed its hero as a practical model to himself, and, at the age of thirteen, eloped with the view of making his way to Holland, and there get on board ship for Batavia; but he was overtaken, and his project frustrated. He was still however left as before to indulge his fancy with romantic reading and with legendary lore, including that of saints and martyrs, as well as of northern fable and mythology. In reading the classics it was the adventurous part that chiefly engaged his attention. Notwithstanding he was of exceedingly weak frame of body, he longed to devote himself to a military career, and the war then carried on between Prussia and Austria afforded an opportunity; but his thoughts were for a while diverted from such views by a very different object. He suddenly became violently enamoured with a young lady, a relation of his stepfather's, for his mother was now married again, whom he has celebrated under the name of Arense, and his passion for whom he has described in the most glowing colours. This passion, although the source of heartfelt bitterness to him—since Arense bestowed her hand upon another—while it cast a shade of melancholy over his whole life, had a favourable influence on his poetical talent, producing in him that depth of feeling and pathos which discovers itself in his 'Balders Død' (Death of Balder). At this period however poetry, at least authorship, formed no part of his plans. He joined with his elder brother in the scheme of entering the Prussian service as hussars, but his brother returned after reaching Hamburg. Johannes however proceeded to Magdeburg, where he enlisted, but was received only as a foot-soldier. In conse-

quence of this disappointment he deserted to the Austrians; served in Bohemia; and was at Dresden when that capital was besieged by the Prussians. On his return to Denmark he applied himself to the study of theology, with the view of settling in that profession and marrying; but his hopes of the latter were frustrated, as already noticed. He now regarded with indifference all schemes of earthly felicity; and it was in this frame of mind that he took up his pen and produced his 'Lykken's Temple' (The Temple of Fortune, a vision), which at once stamped his reputation. This was succeeded by his 'Adam and Eve,' a dramatic composition replete with poetical energy, though in many respects defective and anomalous. Conscious of its imperfections, he devoted two years entirely to the study of poetry, in order to prepare himself for some more finished undertaking. Having made himself master of the English language, he carefully perused Shakspeare and Ossian; and when he again took up his pen, he composed his 'Rolf Krage,' a tragedy strongly tinged with Ossianic taste. It was first given to the public in 1770; about which time he was attacked with a painful disorder in his limbs, that continued to afflict him with little intermission during the rest of his life. Notwithstanding his severe sufferings and distressed circumstances, he not only pursued his literary occupations, but wrote his comedy of 'Harlequin Patriot,' a masterpiece of its kind, abounding with pleasantry and satire chiefly directed against pseudo-reformers. In the following year, 1773, he executed his literary chef-d'œuvre, 'Balders Død,' a drama of much poetical beauty, and greatly superior to anything of the kind that had then appeared in the Danish language. Yet although well received, its merits were not so well appreciated by its author's contemporaries as they have been since. It is on this and his other poetical works that his reputation chiefly rests, but Evald produced also several things in prose, some of which, as his 'Forsøg om Petersvende' (Project respecting Old Bachelors), are replete with shrewd satire and strong comic humour. Their liveliness forms a strong contrast to the seriousness and even melancholy that pervade his other writings: in which respect he presents a parallel to the author of 'John Gilpin.' There is likewise another point of resemblance between Evald and Cowper; each in his affliction met with generous sympathy and succour from a female friend. What Mary Unwin was to the one, Madame Skou was to the other; and it was beneath the hospitable roof of the latter that the Danish poet breathed his last, on the 17th March 1781, after being confined during two years to his bed or arm-chair, and almost deprived of the use of his limbs. The two poets may further be likened to each other for the high moral tone of their writings, vividness of conception, and happiness of expression.

*EVANS, LIEUTENANT-GENERAL SIR DE LACY, K.C.B., is the son of John Evans, Esq., of Miltown, Ireland, and was born at Moig in 1787. He became ensign in the 22nd Regiment of Foot in 1807, and served three years in India. In 1812 he joined the 3rd Light Dragoons, with which regiment he served in Portugal and Spain in the campaigns of 1812, 1813, and 1814. He was present at the retreat from Burgos and the action on the Hurmasa, in which he was wounded; as also at the battle of Vittoria, the investment of Pampeluna, the battle of the Pyrenees, the investment of Bayonne, and at the battle of Toulouse, where his horse was shot under him. In 1814 he was appointed Brevet Lieutenant-Colonel in the 5th West India Regiment, and took part in the capture of Washington under General Ross and Admiral Cochrane. He was likewise present at the attack on Baltimore and the operations before New Orleans, when the American flotilla was captured. Returning to England early in the following year, he accompanied the army under the Duke of Wellington into Belgium, and was assistant-quarter-master-general at Quatre Bras and at Waterloo, where his horse was shot under him, and also at the subsequent investment and capitulation of Paris, where he remained for some time upon the staff of the army of occupation. His next military employment was in 1835, when he volunteered to command the British Legion, 10,000 in number, raised with the consent of the existing government in aid of the Queen of Spain against Don Carlos. In Spain his first service was to save the corps under General Epaletta from destruction at Bilbao; he subsequently took possession of San Sebastian, defeating the Carlist troops by which it was invested. After several fierce engagements with the enemy, in which both skill and bravery were displayed, but in which success was too frequently purchased at a great loss, he succeeded in storming and capturing the fortress of Irun, in the spring of 1837. For these exploits he received the Order of the Bath, and the Cross of San Ferdinand and San Charles of Spain.

In 1831 he was elected to the House of Commons as member for Rye, but lost his seat in the following year. In May 1833 he was chosen for Westminster, which he has continued to represent since that time with the exception of the parliament of 1841-47. In 1854 Sir De Lacy Evans was appointed to the command of the Second Division of the army in the East. He particularly signalled himself at the battle of the Alma, and in the attack of the Russians on October 26. At the battle of Inkermann he rose from a sick bed and joined his division, though he refused to take the honours of the day from General Pannefather, who was in command during his absence. For this action, and for his gallantry at the Alma, he was mentioned with high praise by Lord Raglan, and received the thanks of the

House of Commons on his return to England in February 1855. At the same time he was honoured with the Grand Cross of the Bath. In 1853 he obtained the colonelcy of the 21st Fusiliers.

EVELYN, JOHN, author of 'Sylva,' 'Memoirs,' &c., was the second son of Richard Evelyn, Esq., of Wotton, in Surrey, and was born at that place October 31, 1620. He received his education at Lewes' free school and Balliol College, Oxford. In 1641 he went abroad, and served for a short time as a volunteer in Flanders. Instead of taking arms in the royalist cause, as his family politics would have inclined him, he went abroad a second time in 1644, with the king's permission, and spent, with one interval, the next seven years on the continent, diligently employed in studying natural philosophy, cultivating the fine arts, and acquainting himself with such particulars of manners, trade, and manufacture as were most worthy of notice. In June 1647 he married the daughter of Sir Richard Browne, the royalist ambassador at Paris, and in right of his wife became possessed of Sayes Court, near Deptford, where he fixed his abode on returning to England in 1652. He lived in privacy and study till the Restoration; after which, being much esteemed by the king and of some weight by family, fortune, and character, he was often withdrawn from his retirement and engaged in many capacities in the public service. He was appointed a commissioner to take care of the sick and wounded, on the Dutch war breaking out in 1664, commissioner for the rebuilding of St. Paul's, a member of the Board of Trade on its first institution, &c. He was also one of the first members of the Royal Society, and continued through life a diligent contributor to its 'Transactions.' His most favourite pursuits were horticulture and planting, upon which he wrote a variety of treatises which are collected at the end of the fifth edition (1729) of his 'Sylva, or a Discourse on Forest Trees and the Propagation of Timber in his Majesty's Dominions,' first published in 1664. The object of this, the best known and chief of Evelyn's works, was to encourage planting, both as a matter of national interest and of private adventure. It sold largely, and, as Evelyn himself says, had no small effect. In the same year he published the first 'Gardener's Almanac,' containing directions for the employment of each month. This was dedicated to Cowley, and drew forth one of his best pieces, entitled 'The Garden,' in acknowledgment.

Mr. Evelyn's works on the fine arts are: 'Sculptura,' 1662, a history of the art of engraving, in which the first account is given of Prince Rupert's new method of mezzotinto engraving; 'A Parallel of Antient and Modern Architecture,' 1669; 'Numismata, a Discourse upon Medals,' 1697. All these, though long superseded, were much esteemed, and were in fact valuable additions to the then existing stock of literature.

By the death of his brother, in October 1699, Mr. Evelyn succeeded to the family estate at Wotton, where he died, February 27, 1706, full of honour as of years. He was a diligent and successful labourer, in that age of discovery, in the subordinate departments of science; a valuable pioneer, as he used to call himself, in the service of the Royal Society. Besides this, he was a model for the character of a gentleman. A friend of the learned and the good, devoid of jealousy, pious, beneficent, intellectual, delighting in the occupations of his station, yet always ready to quit them for the public service: he was respected even by the court profligates to whom his example was a daily reproach. To the present age he is best known by his Memoirs, a journal extending nearly from his childhood to his death, which contains much curious and valuable matter relative to his travels, and to the manners and history, political and scientific, of the age. Many of his letters, and the private correspondence of Charles I. with Secretary Nicholas, and Clarendon with Sir R. Browne, are subjoined to these memoirs, which were first printed in 1818 in 4to, but have since been several times reprinted in a more convenient and less expensive form.

EVERDINGEN, ALDERT VAN, a very able Dutch landscape painter and etcher, born at Alkmaar in 1621. He studied under Roland Savery and Peter Molyn, known as the Cavaliere Tempesta, and he surpassed them both. The wild and the rugged is the prevalent style of his landscapes, and chiefly from Norwegian scenery; he spent upwards of a year in Norway, and took the greatest delight in sketching the wild scenery of its rugged coast. Everdingen was excellent also in sea-storms, and in all his works showed himself a master of aerial perspective. Some of his fine forests are extremely true and picturesque, and he excelled in figures and animals. He died at Alkmaar in 1675. Everdingen's etchings are numerous, but scarce; among them are a series of one hundred Norwegian landscapes, and a series of fifty-six original illustrations to the celebrated Dutch fable of 'Reynard the Fox;' his plates are generally marked A. V. E.

Aldert's elder brother, CESAR VAN EVERDINGEN, was likewise a clever painter, and an architect; he painted history and portrait. He was born at Alkmaar in 1606, and died there in 1679.

(Houbraken, *Groote Schouburg*, &c.; Bartsch, *Peintre-Graveur*.)

*EVERETT, ALEXANDER HAMILTON, was born March 19, 1790, at Boston, United States of North America, where his father occupied a high position as a clergyman. He graduated with distinction at Harvard University in 1806; was for a while tutor in an academy; and then entered the office of Mr. John Quincy Adams, as a law student. He accompanied Mr. Adams in his mission to Russia

in 1809; spent two years at St. Petersburg in the study of the modern languages, political economy, &c.; then spent about a year in England, and made a short stay at Paris. On his return to America he commenced the practice of the law in Boston. He afterwards accepted the office of Secretary of Legation to the Netherlands; and from 1818 to 1824 served as *Chargé d'Affaires* there. Whilst practising as an advocate at Boston, Mr. Everett had become connected with the periodical literature of that city, and he availed himself of the opportunities afforded by his official position in Europe to carry out on a broader scale his studies and researches. The result of his investigations he published in 1821 in a work which attracted considerable attention, and was speedily translated into the French, German, and Spanish languages: 'Europe, or a General Survey of the Principal Powers, with conjectures on their future Prospects.' He also published in 1822 'New Ideas on Population, with Remarks on the Theories of Godwin and Malthus.'

In 1825 Mr. Everett was appointed by President Adams minister to the court of Spain; and he retained this honourable post for nearly five years. The duties of this office were at that time of a very onerous character, but Mr. Everett, besides discharging them to the satisfaction of the American government, found time to devote to literature, and to aid the literary inquiries of Mr. Ticknor, Washington Irving, and other eminent Americans. He wrote whilst in Spain a companion work to that already mentioned, entitled 'America, or a General Survey of the Political Situation of the several Powers of the Western Continent, with Conjectures on their future Prospects.' Whilst in the Netherlands and in Spain Mr. Everett had contributed numerous articles on French and American literature, political economy, and other important subjects, to the 'North American Review,' then edited by his brother; and on his return to America he purchased this review, and for some four or five years was its editor and chief contributor. He also at this time and subsequently took a prominent part in politics, acting with the democratic party, and serving as a senator in the Massachusetts legislature. He was sent as agent of the American government to the Island of Cuba in 1840. In 1841 he was elected President of Jefferson College, Louisiana, but was compelled after a short time to resign on account of enfeebled health. In 1846 he was sent as Minister Plenipotentiary to China; since his return from which mission he has chiefly devoted himself to his private engagements.

Mr. Everett enjoys a high reputation in his own country as a scholar, a writer, and a publicist. His writings are very numerous, including besides those mentioned above, a large number of essays contributed to the North American and other reviews, orations delivered on public occasions, &c., and some poems. The more important of these he collected in two volumes, 1845-47: a second edition of the first volume was published in 1846.

EVERETT, EDWARD, D.C.L., brother of the preceding, was born in April 1794 at Dorchester, near Boston, United States; graduated at Harvard University in 1811; and after a brief trial of the study of the law, entered the Divinity School, acting at the same time as Latin tutor. He had been scarcely two years engaged in the study of theology when he was invited to succeed the Rev. J. S. Buckminster, who at his death was regarded as the most eloquent pulpit orator in America, and was the pastor of one of the largest and wealthiest Unitarian congregations in Boston. Mr. Everett was at this time only nineteen years of age, but it is said that he amply justified the confidence reposed in him, and fully sustained the high reputation of the Brattle-street pulpit for intellect and eloquence. Before he was twenty he had published an elaborate 'Defence of Christianity against the work of G. B. English, entitled *The Grounds of Christianity Examined*.' His close attention to his ministerial duties soon began to affect his health; and he, in 1815, exchanged his pastoral office for that of Eliot Professor of the Greek Language and Literature in Harvard University, permission being accorded him to visit Europe for the benefit of his health, and to prepare himself for his professional duties.

Being shut out from Germany by the disturbed state of the continent, consequent upon Napoleon I.'s escape from Elba, Mr. Everett came to England, where he stayed till after the battle of Waterloo, when he proceeded to Göttingen. There he resided for about two years, studying the German language, and making himself acquainted with the methods of instruction adopted in that and other German universities. In 1817 he proceeded to Paris, thence the next year to England, and in the winter of 1818 to Rome, where he availed himself of the literary treasures of the Vatican; and, being in frequent intercourse with the leading artists and archaeologists of Italy, he studied the arts and literature of ancient and modern Rome. In 1819 he visited Greece, Turkey, &c., his way being smoothed by letters of introduction furnished him by Lord Byron; he afterwards visited Austria, Hungary, &c. He returned home, after an absence of about five years and a half, a ripened scholar, and with an enlarged acquaintance with men and manners; and he carried into the discharge of his duties at the university all the advantages he had thus derived, giving to his projections an unusual breadth and scope, together with decided practicality of purpose. In 1820 he added to his occupations that of conducting the 'North American Review,' and under his editorship it attained a much higher celebrity than any similar work had previously

obtained in America, and came to be received in Europe as the exponent of the current literary culture of the States. During the four years that he remained its editor, Mr. Everett is said to have furnished no less than fifty articles to the pages of the 'North American Review,' many of them of a very learned, and others of a very important character.

Although at first known merely as a divine and a scholar, Mr. Everett, like most of his countrymen, early took a share in political discussions. In the 'Review' he found many opportunities of making his sentiments known, and his masterly style of public speaking procured him to be in great request for the delivery of those favourite semi-poetical, semi-political flourishes of the American people called 'Orations.' At length in 1824 he was elected to the House of Representatives, and he continued to be a member of congress till 1836, when he was chosen governor of Massachusetts; an office to which he was re-elected at the three following annual elections.

When General Harrison became president of the United States in 1841, he appointed Mr. Everett his minister to the English court, and this distinguished post he held for nearly five years, with credit to himself and his government, at least equal to that of any other American minister who ever resided here. In England Mr. Everett in fact gained the esteem of all with whom the duties of his office, or the courtesies of society, brought him into connection; and whilst here the University of Oxford marked its opinion of his scholarship and the general sense of his merits by bestowing upon him the degree of D.C.L. On his return to America Mr. Everett was immediately elected President of Harvard University, an office he retained till 1849, when ill-health compelled him to resign it. He was in 1853 elected member of the senate for Massachusetts.

Mr. Everett is regarded as one of the first scholars, most eloquent orators, and accomplished and liberal-minded statesmen of America, and his high public and private character gives additional weight to his intellectual eminence. To his literary powers he has hardly however done full justice, having never concentrated his energies on any important work. He published in 1826 a volume of twenty-seven Orations and Speeches delivered by him on various public occasions; which in a second edition in 1850 he extended to two volumes. His subsequent discourses, many of which attracted great notice when delivered, his critical and miscellaneous essays, and various short poems, remain at present in a fugitive form. A 'Biographical Memoir of the Public Life of Daniel Webster,' by Mr. Everett, is prefixed to the 'Works' of Mr. Webster.

EVLİYA, a celebrated Turkish traveller, generally spoken of as EVLİYA EFFENDİ, was born at Constantinople in the year 1020 of the Hegira, answering to A.D. 1611. The circumstances of his parentage are characteristic. His mother was a slave from the Abaza tribe on the Black Sea, who was sent when young with her brother to Sultan Ahmed, who kept the boy for a page, and gave the girl to Mohammed Dervish, chief of the goldsmiths. Mohammed Dervish, the father of Evliya, had when young been the standard-bearer to Sultan Solymau at the memorable siege of Sigeth, or Sziget, in Hungary, in 1564, and one of his ancestors had been the standard-bearer to Mohammed II. at the siege of Constantinople. His share of the spoil at the capture had been a house and piece of ground in a good situation, on which he had built 100 shops, and the profits of this speculation he had assigned to a mosque, not however so entirely but that the administration of the revenues remained in the hands of his family. Evliya received a careful education, and attended for seven years the college of Hamid Effendi in one of the quarters of Constantinople. One of his accomplishments was that of knowing the Koran by heart, as a token of which he assumed the technical appellation of *Hafti*, but he tells us that in his own time there were 6000 men and 3000 women at Constantinople who had the same proficiency. A dream which he had on the night of his twenty-first birthday, and which he relates with great minuteness at the commencement of his travels, made him resolve to devote his life to seeing the world and writing a description of what he saw, and the next forty-one years of his life were chiefly occupied in travelling. His movements were almost always connected with military expeditions or with diplomatic and financial missions, for his appointment to which he had a powerful friend in his uncle, the Abaza slave, Melek Ahmed, who rose from the post of sword-bearer to the sultan, to that of grand-vizier. Evliya tells us that in the course of his career he had seen twenty-two battles, had visited the countries of eighteen different monarchs, and had heard 147 different languages spoken. He made the pilgrimage to Mecca, went to the Morea, Syria, and Persia, and in 1664 was secretary to Kara Mohammed on his embassy to Vienna, after which he obtained permission to travel on his own account through Germany and the Netherlands as far as Dunkirk, returning through Denmark, Sweden, Poland, and the Crimea. The last ten years of his life were devoted to writing his travels in retirement at Adrianople, and he died about the year 1679.

The travels of Evliya occupy four volumes in Turkish, and the narrative comes down no later than the year 1655, so that it would appear he did not live to complete it. One volume of the four has been published in English (part 1 in 1834, part 2 in 1846) by the Oriental Translation Fund, from the pen of the celebrated orientalist Von Hammer. It consists of a curiously minute account of Con-

tantinople, of a character which seems to entitle Evliya to the appellation which he tells us one of his ancestors rejoiced in, "the Turk of Turks." The most childish credulity and superstition are apparent in every page: with some powers of observation and memory there is a total lack of judgment. A detailed statement of the distances round Constantinople, which Evliya walked round for the purpose in 1634—as careful and circumstantial a narrative as Dr. Birch's of his similar walk round London—is followed by a lengthy enumeration of the different talismans by which the city was protected by the ancient Greeks, a striking testimony of the ignorant awe with which the savage conquerors looked up to the superior civilisation they had subdued. There is no work now extant in a European language, from which a correct idea of the Turkish mind may be so easily formed, as from the travels of Evliya.

EVREMOND. CHARLES DE ST. DENYS, SEIGNEUR DE ST. EVREMOND, was born April 1, 1613, at St. Denys-le-Guast, near Coutances in Normandy. He entered the army early, and by his literary talents and sprightly wit, as well as bravery, acquired the friendship of Turenne, Condé, and other of the most distinguished men of that brilliant epoch. Condé made him lieutenant of his guards, for the sake of his society; and he fought with that great commander at the battles of Rocroi and Nordlingen. But the prince, though fond of raillery at the expense of others, could not bear it levelled against himself; and St. Evremond, by an imprudent exercise of his satiric humour, lost his patron and his lieutenantcy in 1648. In the wars of the Fronde he espoused the royal cause, and was rewarded with promotion and a pension. He incurred a three months' imprisonment in the Bastille by making too free with Cardinal Mazarin; but found means to reinstate himself in the minister's favour. Another indiscretion in ridiculing the treaty of the Pyrenees (unless, as has been said, there was some secret cause for his disgrace, and this was only a pretext), led to a second order for his arrest in 1661. He received timely notice, and fled, first to Holland, then to England, in which two countries the rest of his long life was spent. Louis XIV., though solicited by his most favourite courtiers to pardon St. Evremond, remained inflexible till 1689, when he granted the exile a tardy permission to return. But it was then too late for St. Evremond again to change the scene; and though in banishment, his life had all that he required for happiness. He was a favourite with Charles II., who gave him a pension of 300*l.*, and his society was courted by the most distinguished wits and beauties of that reign; nor was he less fortunate in possessing the regard of William III., who had known him in Holland, and took much pleasure in his company. Devoted to the enjoyment of the present, and availing himself moderately of every source of social pleasure, he retained his faculties, mental and bodily, to the last, and died in his ninety-first year, September 20, 1703.

St. Evremond was one of those who, aiming chiefly at success in society, leave no memorials sufficient to sustain the reputation which they have enjoyed in life. He possessed however extensive reading and an independent and acute judgment, as well as wit. His verses are deservedly forgotten; and his treatises on Roman literature and on the modern drama, though ranked among his best works, are probably seldom read. His letters are among the most brilliant specimens of that style of composition in which the French have excelled. He appears to have been a disbeliever in revealed religion, but he was not a scoffer, and he checked wanton insult to religion in others. He never authorised the publication of his works, so that the earlier editions, which were all pirated, contain much that was foisted in by the booksellers to profit by his popularity. The first correct edition is that of Des Maizeaux, 3 vols. 4to, Lond., 1705, with a life prefixed, from manuscripts revised by the author and editor jointly, shortly before the death of the former. Des Maizeaux also translated the whole into English.

* EWART, WILLIAM, M.P., the son of a merchant and broker at Liverpool, was born in 1793. He was educated at Eton and at Christchurch, Oxford, where he gained the Newdegate prize for English Verse in 1819. He subsequently was called to the bar at the Middle Temple. He was chosen member for Bletchingley in 1828; sat for Liverpool from 1830 to 1837, and for Wigan from 1839 to 1841; since which time he has represented Dumfries. Mr. Ewart has distinguished himself in Parliament not only for his constant motions for the abolition of capital punishment, but also for having proposed and carried by steady perseverance several bills for the establishment of public libraries and museums and schools of design. He is one of those individuals who have contributed most largely in a variety of ways towards the spread of national secular education and the repeal of taxes on knowledge.

EXCELMANS, REMI-JOSEPH-ISIDORE, BARON, Marshal, was a native of Bar-le-Duc, where he was born November 13, 1775. He entered the army very young, and first drew attention to his services, in 1799, whilst under General Oudinot, during the campaign which terminated in the conquest of Naples. In 1800 he became aide-de-camp to General Broussier; but exchanged that for the same post under Murat. At the combat of Wertingen, on the Danube, October 8, 1805, he had three horses killed under him; and being commissioned to lay the numerous flags taken from the enemy at the feet of Napoleon I., he received from the hands of the emperor the decoration of officer of the Legion of Honour.

In 1806 he was made colonel of the first regiment of Chasseurs, and was mainly instrumental in the capture of Posen, in Poland. He was afterwards engaged at the doubtful battle of Eylau, and for his conduct in that action (1807) he was appointed to command a brigade, and placed on the staff of Prince Murat, whom he afterwards accompanied to Spain. It was General Excekmans who was commissioned to head the escort by which King Charles was attended to Bayonne, after he had been induced to abdicate in favour of his son. A few weeks after this special service, Excekmans was arrested with other officers, and sent to England, where he remained a prisoner until 1811. On his release he again joined his former general, who had ascended the throne of Naples. Sent to Russia in 1812, in Junot's corps, as second in command, he was several times wounded, and was created a general of division, September 8, 1812. Savary, in his 'Memoirs,' ascribes entirely to Excekmans the merit of saving the remnant of this corps, which returned home after that arduous campaign.

In 1813 his division was placed under the orders of Marshal Macdonald; he took an active part in the operations in Saxony and Silesia, and was rewarded with the cordon of great officer of the Legion of Honour. In 1814 he commanded the cavalry of the Imperial Guard, and was present in most of the battles fought by Napoleon to defend the French territory. After the return from Elba, General Excekmans was called to the Chamber of Peers, June 2, 1815; and despatched to join the army of the north. He was not present at Waterloo, but he had the merit of bringing back his division to the walls of Paris, in time to defend the capital, and to check the advance of the Prussians, whom he defeated at Versailles in the last action of the war. Excekmans was included in the decree of July 24, 1815, and banished from France with many other generals, who had served the emperor during the hundred days. It was not until 1819 that he was permitted to return to France, during the ministry of Marshal Gouvion Saint-Cyr; in 1831 Louis Philippe restored to him his title and rank in the Chamber of Peers.

Louis Napoleon raised him to the dignity of Marshal of France in the early part of 1849, and nominated him Chancellor of the Legion of Honour in August of the same year. On the 2nd of December 1851, Marshal Excekmans powerfully assisted in securing to the government of Napoleon the faithful adherence of the army. On the 21st of July 1852, the marshal was on his way to the house of the Princess Mathilde, in company with one of his sons, when he was suddenly jerked from his horse, and fell on the road, not far from the bridge of Sèvres. He never spoke afterwards, and expired at two o'clock the next morning.

(Rabbe; Savary, *Memoirs*; *Biogr. des Contemp.*; *Dictionnaire de Conversation*.)

EXMOUTH, EDWARD PELLEW, VISCOUNT, a distinguished naval commander, was born April 19, 1757, at Dover, where his father was captain of a government packet. Edward Pellew entered the navy in 1770, and in that year sailed with Captain Stott when he was sent out to retake possession of Port Egmont, on the island of West Falkland, which had been captured and restored by the Spaniards. He was afterwards in the Mediterranean, and was in the *Blonde* frigate, employed in the relief of Quebec. He first distinguished himself in the battle on Lake Champlain, October 11, 1776. After his return to England, he was promoted to the rank of lieutenant in 1779, and in 1782 obtained his commission as post-captain. From 1786 to 1789 he was stationed off the coast of Newfoundland. In 1793, having been appointed to the command of the *Nymph*, frigate, 36 guns, he fell in with *La Cleopatra*, French frigate, 36 guns. The French ship was fought with skill and bravery, but after a desperate battle struck her colours. His gallantry on this occasion was rewarded with the honour of knighthood. Sir Edward Pellew was soon afterwards appointed to the command of the *Arethusa*, frigate, 44 guns, and was engaged in several actions off Jersey and other parts of the French coast, in which some frigates and numerous smaller vessels were captured or destroyed. He was afterwards transferred to the *Indefatigable*, 49 guns. In 1796, after a chase of fifteen hours he came up with *La Virginie*, French frigate, and captured her. On the 13th of January 1797, the *Indefatigable* and *Amazon* having engaged a large French ship in foggy weather, after an action of five hours the *Indefatigable* was obliged to sheer off to secure her masts. Early in the morning breakers were seen, and the skill and energy of Sir Edward Pellew saved the *Indefatigable*, but the *Amazon* and the French ship were wrecked together. The French ship proved to be a two-decker of 80 guns, and had on board, including soldiers, 1700 persons, of whom 1350 perished.

In the early part of 1799 Sir Edward Pellew was appointed to the command of the *Impétueux*, 78 guns, and was actively employed in various services on the French coast. In 1802 he was nominated Colonel of Marines, and in the same year was elected M.P. for the borough of Barnstaple, in Devonshire. On the renewal of the war after the peace of Amiens Sir Edward was appointed to the *Tonnant*, 84 guns, and on the 23rd of April 1804, was promoted to the rank of Rear-Admiral of the Red, and made commander in the East Indies, in consequence of which he resigned his seat in the House of Commons, July 26, 1804. On the 28th of April 1808, he was advanced to the

rank of Vice-Admiral of the Blue, and returned home at the commencement of the following year. In 1810 he was employed in blockading Flushing, and soon afterwards was sent to the Mediterranean as commander-in-chief there. On the 14th of May 1814 Sir Edward Pellew was elevated to the peerage, with the title of Baron Exmouth of Canonteign in Devonshire, with a pension of 2000*l.* a year for his long and eminent services. On the 4th of June 1814, Lord Exmouth was promoted to the rank of full admiral; on the 2nd of January 1815 he was created a K.C.B., and on the 16th of March 1816 a G.C.B.

During his command in the Mediterranean Lord Exmouth had concluded treaties with the rulers of Algiers, Tunis, and Tripoli, for the abolition of Christian slavery in those states; but after his return to England it became known that the Dey of Algiers had violated his treaty in the most flagrant manner. The British government, in conjunction with that of Holland, having resolved to chastise the Algerines, Lord Exmouth set sail on board the Queen Charlotte with eighteen other vessels of war, and having been joined by the Dutch admiral with six frigates, they appeared before the city of Algiers on the 26th of August 1816. The plan of attack was one of the most daring on record. The Queen Charlotte sailed into the harbour, and took her station within the mole at eighty yards from the principal batteries, and with her bowsprit almost touching the houses. The other ships were placed in admirable order to support each other and act with most effect against the enemy. A tremendous fire was commenced on both sides at a quarter to three in the afternoon. The Algerine fleet, consisting of four large frigates, five large corvettes, and a large number of smaller vessels, were all on fire at once, and the flames had extended to the arsenal and other public and private buildings. At ten o'clock p.m. the firing ceased, the Dey of Algiers having consented to every demand. On the 30th of August a treaty was concluded on the terms dictated by the conquerors. Lord Exmouth was slightly wounded in the leg and also on the cheek, and his coat is described as having been almost torn into strips by grape and musket shot. On his return to England he received the thanks of both Houses of Parliament, and on the 10th of December 1816 was raised to the rank of Viscount. About 1200 Christian slaves were set at liberty, and insignia of knighthood were sent to Lord Exmouth from several states to which they belonged. On the death of Sir Thomas Duckworth he was appointed to the chief command at Plymouth, but after 1821 he retired from public service. He died January 23, 1833.

EYCK, HUBERT VAN. This celebrated old Flemish painter, the elder brother and master of John Van Eyck, was born, according to Van Mander, in 1366, and probably at Eyck (now Alden Eyck), a small village near Maaseyk on the Maas. The two brothers established themselves first in Bruges and afterwards in Ghent. The name of Hubert Van Eyck is nearly lost in that of his younger brother and pupil John, apparently from no other reason than that John alone is mentioned by Vasari in his story of the invention of the new method of oil-painting, while he takes no notice whatever of Hubert; John's name therefore appears as the principal or indeed sole name in nearly all subsequent investigations relating to the origin of this method of oil-painting, and the joint productions of the two brothers are generally adduced as the works of John alone. But the great probability is that much of the invention or improvement was the result of their joint experiments, and it is not unlikely that their great merit really consisted in carrying forward to a much higher, point of success the practice of their predecessors.

Van Mander says that the Van Eycks must have painted in their new method as early as 1410, and as Hubert did not die till the 18th of September 1426, according to the inscription on his tomb in the church of St. Bavon at Ghent, they worked a sufficient number of years together to completely develop it in practice. John Van Eyck cannot have been very old in 1426, as, according to an authentic lottery notice of his widow, though alive in 1445, he died before the 24th of February 1446, and he was still young when he died, according to Marcus Van Vaerenwyck, who published a 'History of Belgium' in 1565. This is somewhat corroborated by a portrait of John in the Museum of Berlin, dated 1430, in which he appears about thirty-five years of age. John was therefore about thirty years younger than his brother Hubert, supposing the latter to have been born in 1366, and accordingly he can have been at first little more than the assistant of Hubert in their masterpiece, the great altar-piece of St. Bavon's, Ghent, which was finished by John in 1432. His name is clearly subordinate to Hubert's in the inscription on the work, which is as follows, the last verse being a chromogram:—

"Pictor Hubertus e Eyck, major quo nomen repertus
Incepit; pondusque Johannes arte secundus
Frater perfectit, Judoel Vyd prece fretus
Verso ve Xta Mai Voe ColLoCat aCta tVeri."

The capitals in the last line, when added together according to their value as Roman numerals, make 1432.

The altar-piece is about fourteen feet wide by twelve feet high, and is in two horizontal divisions, each centre covered by revolving wings or doors, two on each side. There are twelve pictures in all: God the Father, with the Virgin and St. John the Baptist, as large as life, one on each side in distinct compartments, constitute the upper centre;

the extreme wings of this division are full-length naked figures of Adam and Eve, Adam on the right and Eve on the left of the centre; the interior wings represent on the right hand angels singing, on the left, angels playing musical instruments. The lower centre represents in one picture the actual Adoration of the Lamb in small figures; the two wings to the right represent the just judges, Justi Judices, and the soldiers of Christ, Christi Milites; the two on the left, the holy hermits, Heyremiti Stl., and the holy pilgrims, Perigrini Stl.: there are in all about 60 figures and 300 heads. An elaborate copy of it was made by Coxe for Philip II. of Spain. [COXE, MICHAEL.] The colouring of the whole work is beautiful, and many parts are admirably executed; and the painting is still in excellent preservation, owing to the excellent oil-vehicle discovered by the Van Eycks. The original picture remained entire till the French obtained possession of Belgium. The clergy of the cathedral of St. Bavon succeeded in concealing eight of the twelve panels, so that only four were taken to Paris, whence they were brought back in 1815. Only the two central divisions however now remain at St. Bavon's, the wings having been sold and removed to Berlin, where they are now in the Royal Museum, united with a part of the copy made by Coxe for Philip II.

The medium employed by the Van Eycks was not merely oil: it was several oils mixed with resins, or some such substance, and prepared by fire. Many useless and intemperate discussions have arisen from Vasari's attributing the invention of oil-painting to John Van Eyck, but they are due chiefly to a careless or partial consideration of what Vasari really says. In one passage in the *Life of Antonello* he fully describes, though in general terms, what the Van Eyck medium was, but in others he merely terms it oil-painting, a term, after what he had said before, sufficiently characteristic and distinctive. The Cav^e Tambroni however in his preface to the treatise of Cennino Cennini (Rome, 1821), has, with much dissingenuousness, argued solely upon the general impressions of Vasari, and ridiculed the story as an absurd fiction, because mere oil-painting was known in Italy before it was introduced by Antonello of Messina. [ANTONELLO DA MESSINA.] It is true that Cennino Cennini wrote his book in 1437, and it contains five chapters on oil-painting, but he prefaces his remarks by the following observation:—"I will now teach you to paint in oil, a method much practised by the Germans." The oil-painting which Cennino teaches is no more that of the Van Eycks than tempera painting is; it is the very method which the Van Eycks superseded. An old German monk of the name of Tutilo or Theophilus wrote on the same subject centuries before Cennini. [TUTILO.] The words of Vasari are—"At last, having tried many things, separately and compounded, he discovered that linseed and nut oils were the most siccative: these therefore he boiled with other mixtures, and produced that varnish (vehicle) which he, and indeed every painter in the world, had long desired." This is what the Cav^e Tambroni and others have treated as an assertion that John Van Eyck invented and introduced the practice of mixing colours with oil. Sir C. L. Eastlake, after an elaborate investigation of every passage of contemporary or nearly contemporary authority which in any way bears on the subject, arrives at the conclusion that their new vehicle was an oleo-resinous one, the resin being probably amber or copal; and that the use of that in conjunction with a great superiority of technical skill would be amply sufficient to account for their works appearing so much finer than those of their predecessors and contemporaries, the painters in tempera and plain oil, as fully to explain the fact of their being termed the inventors of a new method.

Several interesting notices of the brothers Van Eyck appeared in the *Messenger des Sciences et des Arts*, Gand, 1824; and in the *Kunstblatt* in 1824 and 1826; see also Passavant, *Kunstreise*, &c. (in which there is an outline of the altar-piece of Ghent); and Rathgeber, *Annalen der Niederländischen Malerei*; see also Eastlake, *Materials for a History of Oil-painting*, chaps. vii. and viii.; and Carton, *Les Trois Frères Van Eyck*.

EYCK, JOHN VAN, the younger brother of Hubert and the improver and supposed inventor of oil-painting, sometimes called John of Bruges from his having settled in that place, was born at Maaseyk as is generally said, in 1370, and studied with his elder brother Hubert. There are however some reasons for supposing John to have been born much later than 1370. As noticed under Hubert Van Eyck, although the Van Eycks did not invent, they greatly improved the art of oil-painting, and brought it into general use. After having long resided in the rich and flourishing city of Bruges, the two brothers removed about 1420 to Ghent, where their greatest and most renowned work, the adoration of the Lamb for the altar-piece at St. Bavon's, was painted between the years 1420 and 1432. Some say it was painted for Iodocus Vyts, a rich citizen of Ghent, while others affirm that it was by order of Philip, duke of Burgundy, count of Flanders, who came to the government in 1420. It is certain however that John Van Eyck was long attached to the brilliant court of Philip. John Van Eyck probably greatly advanced in the path opened by his elder brother. He was endowed, as Eastlake observes, "with an extraordinary capacity for seeing nature," an endowment of the very first consequence for the painter; "and thus gifted, and aided by the example and instruction of Hubert, a world was opened to him, which his predecessors had not attempted to represent." The best works of John Van Eyck are now chiefly in the

galleries of Germany and the Low Countries; in our National Gallery there is one painting, entitled, a 'Flemish Gentleman and Lady,' which was executed by him in 1434, but is still in perfect preservation, and is a remarkable illustration of his brilliancy of colouring, general effect, and surprising technical skill. John Van Eyck died July 14, 1441.

EZEKIEL, the Prophet, was partially contemporaneous with Jeremiah, and is one of the prophets called 'The Greater,' a distinction which relates to the comparative magnitude and importance of their books. He was a priest, the son of Buzi (i. 8), and, according to the account of his life, ascribed (erroneously) to Epiphanius, he was born at a place called Sarcas. In the first Babylonian captivity he was carried away by Nebuchadnezzar into Mesopotamia, with the kings Jeconiah and Jehoiachin, and all the principal inhabitants of Jerusalem, who were stationed at Tel-abib (iii. 15) and at other places on the river Chebar (i. 1, 3), the Chaboras of Ptolemaeus, which flows into the east side of the Euphrates at Carchemish, about 300 miles north-west from Babylon. He is stated to have commenced his prophesying in the fifth year of his captivity (i. 2), about B.C. 598, and to have continued it during more than twenty-two years, that is, until the fourteenth year after the destruction of Jerusalem by Nebuchadnezzar. The pseudo-Epiphanius says that Ezekiel, on account of his aversion to adopt the Chaldean idolatry, was put to death by the Jewish prince or commander of the captives. Rabbi Benjamin of Tudela states that his tomb is between the Euphrates and the Chebar, in a vault built by King Jehoiachin, and that within it the Jews keep a lamp perpetually burning. The same writer asserts, with equal appearance of traditional falsehood, that the Jews possess the book of Ezekiel in the original autograph, which they read every year on the great day of expiation. Greatly inconsistent with such veneration is the fact related by Calmet, that the Jews speak of this prophet very contemptuously as having been Jeremiah's servant-boy, and the object of popular ridicule and railery, whence his name 'son of Buzi' (בן בוז, contempt). Josephus speaks of two books of Ezekiel, but commentators understand him to mean the present book, divided at the end of chap. xxxix., for the nine remaining chapters are distinctly different with regard both to subject and style.

The book of Ezekiel is a canonical book of the Old Testament, divided in our English version into forty-eight chapters, and placed next after Jeremiah's Book of Lamentations, and before the book of Daniel. The first thirty-nine chapters are occupied with the prophet's highly poetic and impassioned announcement of God's wrath and vengeance against the rebellious idolatry, perverseness, and sensuality of the Jews, as well as against their enemies, the surrounding nations. All this portion is replete with dreadful pictures of the calamities of war—of ruin, desolation, death, and destruction—slaughter, pestilence, famine, and every imaginable state of misery; but in the nine chapters of the latter portion the prophet describes, in a more prosaic style, his visions of the new temple and city of Jerusalem. In visionary presence he walks about the holy metropolis of Judaea as raised from its ruins in which it was left by the Chaldean conqueror, and restored to the splendour which it displayed in the reign of Solomon. He measures and observes minutely all the dimensions of the Temple and city; gives directions for the celebration of sacrificial rites, feasts, and ceremonies; partitions the country among the several tribes; and enumerates the duties of priests, king, and people. Dr. A. Clarke, in his edition of the Bible, gives a plate of the Temple, according to Ezekiel's description, and a map of Judaea as allotted by this prophet to the different tribes. A full and particular analysis of the contents of the whole forty-eight chapters is given in Mr. Horne's 'Introduction to the Bible.' The following is a brief and general survey:—Chapters i. to iii. (and see chapter x.) describe the vision of the wheels and cherubim, called 'Jehovah's Chariot,' and the prophet's reception of the divine instructions and commission. Chapters iv. to xxiv. reiterate reproaches and denunciations against the Israelites and their prophets, announcing, in various visions and parables, the numerous calamities about to come upon them as a punishment of their rebellious idolatry and depravity. The species of idolatry adopted by the Jews in preference to the religious system of Moses appears, by the declarations of Ezekiel and the other prophets, to have been Sabism, or the worship of the sun on high places planted with trees. (See chapters viii., xiv., xvi., xvii., xx., xxviii., &c.) The 390 years signified by the prophet's lying as many days (vv. 4, 5) on his right side, are said by biblical chronologists to be the period from B.C. 970 to 580; and the forty years signified by his lying forty days on his right side (v. 6) is the period from B.C. 580 to 540. Chapters xxiv. to xxxii. declare the dreadful judgments of God against the enemies of the Jews, namely, the surrounding nations of Ammonites, Moabites, Edomites, and Philistines; against the cities of Tyre and Sidon; and against all the land of Egypt. Chapters xxxiii. to xxxvii. are occupied with declarations of the justice and forgiveness of God to the repentant—the fall of Jerusalem—a severe rebuke (chapter xxxiv.) of the avarice, idleness, and cruelty of the shepherds or priests of Israel—and consolatory promises of the people's restoration and return to Palestine. Chapters xxxviii. and xxxix. contain the prophecy of Gog and Magog; and the nine concluding chapters, as already stated, contain the prophet's visions of the temple and city of Jerusalem—their dimensions, structure, embellishments, &c.—the ceremonial arrangements of the hierar-

chy, and the allotment of the land of Judaea among the several tribes on their return from captivity. The subject-matter of Ezekiel is, for the most part, identical with that of his contemporary Jeremiah, and much similarity is observable in their declarations. The conquests and devastations of Nebuchadnezzar form the principal theme of each; but Ezekiel views them chiefly as affecting Israel, while Jeremiah describes them with especial reference to Judah. Both declaim with vehement indignation against the depravity of the priests, and against the 'lying divinations' of the prophets who sought to induce the people to shake off their Babylonian slavery. (Compare Jeremiah, chapters xxiii., xxvii., xxviii., xxix. with Ezekiel, chapters xlii., xxxiv.) Parts of the book of Revelations may be compared with some portions of Ezekiel: Rev. iv. with Ezek. i. and x., respecting the cherubim with wings full of eyes; and Rev. xi., xxi., xxii. with Ezek. xl. to xliii., describing the New Jerusalem.

That Ezekiel is a very obscure writer is asserted by all who have attempted to explain his prophecies. The ancient Jews considered them as inexplicable, and the council of the Sanhedrim once deliberated long on the propriety of excluding them, on this account, from the canon (Calmet, *Præf. ad Ezech.*); but to prevent this exclusion, Rabbi Ananias undertook to explain completely the vision of Jehovah's chariot (i. and x.); and his proposal, it is said, was accepted by the council. One of the reasons alleged for rejecting Ezekiel from the canon was that he teaches, in direct contradiction to the Mosaic doctrine, that children shall not suffer punishment for the offences of their parents (xxviii. 2-20). (See Hueti, '*Demonstratio Evang.*, prop. 4, de Prophet. Ezech.') St. Jerome considers Ezekiel's visions and expressions very difficult to be understood, and says that no one under the age of thirty was permitted to read them. (Hieron. *proem. in lib. Ezech.*) Much remains likewise to be done to restore the original Hebrew text to a state of purity. Michaelis, Eichhorn, Newcome, and many other commentators, have written copiously on the peculiarities of Ezekiel's style. Grotius ('*Præf. ad Ezech.*') speaks of it with the highest admiration, and compares the prophet to Homer. Michaelis admits its bold and striking originality, but denies that sublimity is any part of its character, though the passion of terror is highly excited. Bishop Lowth ('*Prælect. Heb. Poet.*') regards Ezekiel as bold, vehement, tragical; wholly intent on exaggeration; in sentiment fervid, bitter, indignant; in imagery magnificent, harsh, and almost deformed; in diction grand, austere, rough, rude, uncultivated; abounding in repetitions from indignation and violence. This eminent judge of Hebrew literature assigns to the poetry of Ezekiel the same rank among the Jewish writers as that of Æschylus among the Greeks; and in speaking of the great obscurity of his visions, he believes it to consist not so much in the language as in the conception. Eichhorn (the peculiar character of whose criticism we have noticed under that article) regards the Book of Ezekiel as a series of highly-wrought and extremely artificial poetical pictures. In accordance with the doctrines of the German rationalism, he considers the prophecies as nothing more than the poetical fictions of a heated oriental imagination of a similar nature with the poetry of the Book of Revelations. The same character of thought and expression is exhibited in the writings of the two other greater prophets, Isaiah and Jeremiah. (Compare Ezek. xvi. 4 to 37; xxiii. 17-21; Isaiah, xxviii. 7, 8; xxxvi. 12.)

EZRA, the author of the canonical book bearing his name, and, as is supposed, of the two books of Chronicles and the book of Esther. Ezra, Esdras, or Esdra, in the Hebrew signifies 'help,' or 'succour.' His genealogy up to Aaron is given in chap. vii. 1-5. In verses 6 and 11 he is said to have been a priest and ready scribe of the words of the law of Moses, and he appears to have been an able and important agent in the principal events of his age and nation. The prophets Haggai and Zechariah were contemporary with Ezra. (Compare Hagg. i. 12, Zech. iii. 4, and Ezra v.) There are four books of Ezra so called. The book of Ezra, which as a canonical book of the Old Testament is placed next after the second book of Chronicles and before the book of Nehemiah, and, in the English version, is divided into ten chapters. By Jews and Christians it has generally been attributed to the priest whose name it bears, chiefly because throughout chapters viii. and ix. the actions of Ezra are related in the first person. The book of Nehemiah, which by the ancient Jews and by the Greek and Roman churches is considered as the second book of Ezra, and two books of Ezra, or Esdras, in the Apocrypha. The first of the two apocryphal books contains the substance of the canonical one, with many circumstantial additions, and in the Greek Church it is read as canonical; but the second exhibits a more decided appearance of fiction, and by no church is regarded as a work of inspiration, though it is cited by several of the ancient fathers. The first six chapters of the canonical book are regarded by some biblical critics as improperly ascribed to Ezra, for between the event with which the seventh chapter commences, that is, the commission from Artaxerxes Longimanus, in the seventh year of his reign, to Ezra to go up to Jerusalem, B.C. 458, and that which terminates the sixth chapter, namely, the completion of the second temple, in the sixth year of the reign of Darius Hystaspes, B.C. 516, there is a chasm of fifty-eight years. The events recorded in the whole ten chapters of the canonical book of Ezra embrace a period of ninety-one years, that is, from the edict of Cyrus issued in the first year of his reign, B.C. 536, for the return of the captive Jews to Jerusalem, to the termination of Ezra's

government by the mission of Nehemiah to Jerusalem from Artaxerxes Longimanus, in the twentieth year of his reign, B.C. 445. As Daniel's seventy prophetic weeks commence at the going forth of the edict of Cyrus to Zerubbabel, or that of Artaxerxes to Ezra, these events have been the subject of much critical investigation among biblical critics.

The contents of the first six chapters are briefly as follows:—Chap. i. gives an account of the proclamation of Cyrus concerning his release of the captive Jews, permitting them to go from Babylon to Jerusalem to rebuild the temple; of the restoration of their property, sacred vessels and utensils; and of presents made by the Chaldeans of money and various provisions. Chap. ii. states the numbers of each of the families composing the multitude which returned to Judæa with Zerubbabel, and the number of their beasts of burden. All this account, except some of the numbers, is repeated word for word in the seventh chapter of Nehemiah, beginning at verse 6. In verses 64 and 65 of Ezra, the total number of the people is said to have been 42,360, which appears not to agree with the preceding particulars, since the addition of these produces only 29,818, that is, a deficiency of 12,542. The numbers given in Nehemiah occasionally differ very widely from those in Ezra: for instance, the children of Azgad are said in Ezra (ii. 12) to have been 1222; but in Nehemiah (vii. 17) they are said to have been 2322, or 1100 more. Nehemiah repeats precisely the total given by Ezra, 42,360; but the addition of Nehemiah's particular numbers makes 31,089, or a deficiency of 11,271. The numbers of horses, 736, mules, 245, camels 435, and asses 6720, exactly agree in the two accounts; but in Ezra, verse 69, the chief fathers give to the treasury 61,000 drams of gold; in Nehemiah, ver. 71, they give only 20,000. Chap. iii. records the events of setting up the altar at Jerusalem and re-establishing the Jewish sacrificial worship. An account of the interruption of the building of the Temple by the decree of Artaxerxes, and its completion by a subsequent decree of the same monarch, with transcripts of the documents written on these occasions, occupy chapters iv., v., and vi. Chapters vii. and viii. contain an account of Ezra's commission from Artaxerxes to undertake the government of Judæa, his preparations and reception of presents for his journey thither, with a multitude of Jews, who it appears still remained in Babylon after the return to Judæa of the multitude under Zerubbabel; an enumeration of the people and families who returned, and the weight of gold and silver contributed by the king, his councillors, and the Israelites, for the use of the Temple at Jerusalem (viii. 25-28). The value of these presents amounts to 803,600*l*. Chapters ix. and x. relate the proceedings of Ezra in separating from their wives and children all the Israelites who had married women from among the surrounding nations, and thus "mingled the holy seed with the abominations of the Gentiles." Ezra (x. 3, 5, 19, 44) made all the Israelites who had "strange wives and children" swear, and give their hands, that they would put them away, which accordingly was done. The latter half of the last chapter contains a long list of the husbands and fathers who were the subjects of this national renovation. The part from iv. 8 to vii. 27 is written in the Chaldee idiom, the rest in Hebrew. The period to which the four last chapters relate, comprising the Jewish history from B.C. 458 to 445, is coeval with the age of Pericles. The subject-matter of the book of Nehemiah being identical with that of Ezra, the collation of the two affords a mutual illustration. Chapter viii. of Nehemiah relates circumstantially the fact of Ezra's solemn reading and exposition of the law to the assembled Israelites, who, according to Dr. Prideaux, were taught the signification of the Hebrew words by means of Chaldeic interpreters (8); for, since their seventy years' captivity in Babylon, the Chaldee instead of the Hebrew had become their vernacular language. (Dean Prideaux's 'Connection,' fol. p. 263.) The critical arguments adduced in opposition to the opinion that the Israelites lost the Hebrew language, and understood only the Chaldean, are well exhibited in Dr. Gill's learned 'Dissertation on the Antiquity of the Hebrew Language,' 8vo, 1767. The two principal undertakings of Ezra were—1. The restoration of the Jewish law and ritual, according to the modes observed before the captivity; and 2. The collection and rectification of the Sacred Scriptures. On account of these important services the Jews regarded Ezra as a second Moses. It was commonly believed by the ancient fathers of the Christian church that all the Sacred Scriptures of the Jews were entirely destroyed in the conflagration of the temple and city of Jerusalem by the king of Babylon, and that, on the return of the Jews from the Chaldean captivity, these writings were wholly reproduced by a divine inspiration of Ezra. (See Irenæus, 'Adversus Hæreses,' l. iii. c. 25; Tertullian, 'De Habitu Mulierum,' c. iii.; Clemens Alexandrinus, 'Strom.' l.; Basil, in 'Epist. ad Chilonem.') The following passages from the second Apocryphal book of Ezra, xiv. 26, 45, 46, 47, appear to sanction this opinion. "Behold, Lord," says Ezra, "I will go as thou hast commanded me, and reprove the people. The world is set in dark-

ness, and they that dwell therein are without light, for 'thy law is burnt;' therefore no man knoweth the things that are done of thee; but if I have found grace before thee, send the Holy Ghost into me, and I shall write all things that have been done in the world since the beginning, which were written in the law; And God said, Go, prepare to write swiftly, and when thou hast done, some things shalt thou publish, and some things shalt thou show secretly to the wise." The learned Dr. Prideaux ('Connection,' p. 260, folio) remarks, that "in the time of king Josiah (B.C. 640), through the impiety of the two preceding reigns of Manasseh and Ammon (a period of sixty years), the book of the law was so destroyed and lost, that, besides the copy of it which Hilkiah, the high-priest, accidentally found in the Temple (2 Kings xiii. 8, &c.; 2 Chron. xxxiv. 14, &c.), there was then no other to be had; for Hilkiah's surprise in finding it, and Josiah's grief in hearing it read, do plainly show that neither of them had ever seen it before; and if this pious king and the high-priest were without it, it cannot be thought that any one else had it." If this were the authentic copy laid up before the Lord in the Temple, it was burned, as believed by all Jewish and Christian writers, in the burning of the Temple, fifty-two years afterwards, by Nebuchadnezzar. Dr. Prideaux takes it to be implied in several passages which he cites that, from the copy accidentally found by the high-priest Hilkiah, some transcriptions were made previous to the destruction of the Temple, and that from these scattered copies Ezra formed his improved edition of the sacred text. In common with most other modern divines, he rejects the opinion of the fathers respecting the restoration of the Scriptures by a new revelation to Ezra. All, he continues, that Ezra did was—"he got together as many copies of the sacred writings as he could, and out of them all he set forth a corrected edition, in which he took care of the following particulars:—1. He corrected all the errors introduced into these copies by the negligence or mistakes of transcribers; for, by comparing them, he found out the true reading, and set all to rights. 2. He collected together all the books of which the Sacred Scriptures did then consist, disposed them in proper order, and settled the canon of Scripture up to that time." The Jewish writers state that the canon was decided by a congress of 120 elders under the presidency of Ezra; but since they mention as members of it, not only the contemporaries of Ezra, as Daniel, Shadrach, Meshech, and Abednego, but the high-priest Simon the Just, who lived 250 years later, it is evident that they mean the number of those who 'successively' arranged and rectified the canonical books. Ezra divided all the books he collected into three parts—the Law, that is, the Pentateuch; the Prophets, containing all the historical and prophetic books; and the Hagiographa, which comprised all the writings not included in the two other divisions. (Josephus, 'Advers. Apion.') He divided the Pentateuch into fifty-four sections, one of which was read every Sabbath; and, according to the Jewish authorities, he was also the author of the smaller divisions called Psukim, or verses, and of the various readings and suggested corrections inserted in the margins of the Hebrew copies. These, called Keri Cetib (that which is read and that which is written), appear however in the books attributed to Ezra himself. (On these particulars see the remarks of Prideaux; Buxtorf, 'Vindicia Veritatis Hebraicæ,' par. ii. c. 4; Walton, 'Prolegom.,' viii. § 18; and Dr. Gill, 'Dissertation on the Hebrew Language.') Most Biblical critics state that Ezra changed the ancient names of places for those by which these places were known in his time, and some say that he wrote out all the Scriptures in the Chaldee character, which alone was used and understood by the Jews after the Chaldean captivity. Whether Ezra added the vowel-points, and whether they were invented by the Masorite grammarians at a period far posterior to the rise of Christianity, are subjects of great controversy among Hebrew critics. A concise and able view of this dispute is contained in Houbigant's 'Racines Hebraïques,' 1732. The Jewish commentators assert that all the rules and observances preserved by tradition from the time anterior to the captivity were carefully collected by Ezra, and that having reviewed them, those which he sanctioned by his authority henceforth constituted the oral law, in contradistinction to that which is written; the Church of Jerusalem, like the Church of Rome, regarding Scripture and tradition of equal authority, and believing the latter to be highly necessary for clearing the obscurities, supplying the defects, and solving the difficulties of the former. (See the Rabbinical authorities cited by Dr. Prideaux.) It is a theory suggested by this learned divine, and since adopted by many others, that all the numerous passages of the Hebrew Scriptures which involve chronological inconsistencies were interpolations made by Ezra, and that this is the only possible way to solve the difficulties which arise from considering the several books as the productions of the persons to whom they are commonly ascribed. The Book of Ezra, with the two Books of Chronicles, Nehemiah, Esther, and Malachi, are supposed by Dr. Prideaux to have been added to the sacred canon by the high-priest Simon the Just, in the year B.C. 150.

F

FABBRONI, ANGELO, born at Florence in 1732, studied at Rome, where he distinguished himself for his ability in Latin composition, through which he became acquainted with the learned Bottari, who introduced him to the Papal Court. In 1766 Fabbroni published the first volume of his Latin biographies of the learned men of modern Italy, '*Vitæ Italarum Doctrina Illustrium*;' a work which he afterwards extended to twenty volumes 8vo, and for which he has been styled by some the Plutarch of modern Italy. His patron Bottari not being on friendly terms with the Jesuits, who had great influence at Rome under Pope Clement XIII., and who accused Bottari of a bias in favour of the Jansenists, Fabbroni found that he had little chance of making his way at the Papal Court, and he returned to Florence in 1767, where the Grand-Duke Leopold appointed him President of the Collegiate Church of San Lorenzo, and afterwards made him Prefect of the University of Pisa, and Prior of the military order of San Stefano. After this Fabbroni travelled through Germany, France, and England, and made the acquaintance of many learned men in those countries. On his return to Tuscany in 1773, he devoted himself entirely to literary pursuits. He continued his series of Latin biographies already mentioned; wrote also some Italian biographies; edited the '*Giornale Pisano*,' a literary magazine, which enjoyed considerable reputation in the latter part of the 18th century; and published an interesting history of the University of Pisa, '*Historia Academiae Pisane*,' 3 vols. 4to, Pisa, 1791. Fabbroni died at Pisa in 1803. A cenotaph was raised to his memory in the Campo Santo of that city. Fabbroni was considered one of the best Latin scholars and writers of Italy in the 18th century. His Italian works are—'*Elogj di alcuni illustri Italiani*,' 2 vols. 8vo, Pisa, 1789; '*Elogj di Dante, di Poliziano, di Ariosto, e di Tasso*,' 8vo, Parma, 1800; '*Dissertazione sulle Statue appartenenti alla Favola di Niobe*,' Florence, 1799. He also contributed to the collection of '*Memorie de' più illustri Pisani*,' 4 vols. 4to, Pisa, 1790.

(Lombardi, *Storia della Letteratura Italiana nel Secolo XVIII.*; Gamba, *Serie di Testi di Lingua*; *Life of Fabbroni*, written by himself, and inserted in the last volume of his '*Vitæ Italarum*.)

FABER, REV. GEORGE STANLEY, was born on the 25th of October 1773. He was the eldest son of the Rev. Thomas Faber, who was decended from a French refugee who came over to England after the revocation of the edict of Nantes. He was educated at the grammar-school of Heppenholme, near Halifax in Yorkshire, where he remained till 1789, when he was entered of University College, Oxford. He took his degree of B.A. in 1792, and before he had reached his twenty-first year was elected a Fellow and Tutor of Lincoln College. He took his degree of M.A. in 1796, served the office of Proctor in 1801, and in the same year, as Bampton Lecturer, preached the discourses which he shortly afterwards published under the title of '*Horæ Mosaicæ*.' He took the degree of B.D. in 1803, and married in the same year. Having by this step relinquished his fellowship, he went to reside with his father at Calverley, near Bradford in Yorkshire, where for two years he acted as curate. In 1805 he was collated to the vicarage of Stockton-upon-Tees, in the county of Durham, which he resigned in 1808 for that of Redmarshall, in the same county. In 1811 he was collated to the vicarage of Long-Newton, where he remained till 1831, when Bishop Burgess presented him to a prebend in the cathedral of Salisbury. In 1832 Bishop Van Mildert gave him the mastership of Sherburn Hospital, near the city of Durham, when he resigned the vicarage of Long-Newton. During his mastership he considerably increased the value of the estates of the Hospital. He rebuilt the chapel, the house, and the offices, and greatly improved the grounds; he augmented the incomes of the incumbents of livings under his patronage, restored the chancels of their churches, and erected agricultural buildings on the farms. He died at his residence, Sherburn Hospital, on the 27th of January, 1854.

The theological writings of Mr. Faber, particularly those on prophecy, have had a very wide circulation. One of the principles for the interpretation of prophecy which he chiefly laboured to establish and exemplify, was, that the delineations of events in prophecy are not applicable to the destinies of individuals, but to those of governments and nations. His writings are numerous, and we can only mention a few of the most important:—'*Horæ Mosaicæ*, or a View of the Mosaic Records, with respect to their Coincidence with Profane Antiquity, their internal Credibility, and their Connexion with Christianity,' 2 vols. 8vo, 1801; '*A Dissertation on the Mysteries of the Cabiri, or the great gods of Phœnicia, Samothrace, Egypt, Troas, Greece, Italy, and Crete*,' 2 vols. 8vo; '*Dissertation on the Prophecies that have been fulfilled, are now fulfilling, or will hereafter be fulfilled, relative to the great Period of 1260 Years*,' 2 vols. 8vo, 1806; '*A General and Connected View of the Prophecies relating to the Conversion, Restoration, Union, and future Glory of Judah and Israel*,' 2 vols. 8vo, 1808; '*The Origin of Pagan Idolatry*,' 3 vols. 8vo, 1816; '*A Treatise on the Genius and Object of the Patriarchal, the Levitical, and the*

Christian Dispensation,' 2 vols. 8vo, 1823; '*The Sacred Calendar of Prophecy, or a Dissertation on the Prophecies which treat of the Grand Period of Seven Times*,' 3 vols. 8vo, 1828; '*Eight Dissertations on certain connected Prophetical Passages of Holy Scriptures bearing more or less upon the Promise of a Mighty Deliverer*,' 2 vols. 8vo, 1845.

FABIUS MAXIMUS and the **FABII FAMILY**. The Fabii were a numerous and powerful gens or patrician house of ancient Rome, which became subdivided into several families or branches distinguished by their respective cognomina, such as Fabii Maximi, Fabii Ambusti, Fabii Vibulani, &c. They were of Sabine origin, and settled on the Quirinal from the time of the earliest kings. After the expulsion of the Tarquinii, the Fabii as one of the older houses exercised considerable influence in the senate. Cæso Fabius being Quæstor with L. Valerius, impeached Spurius Cassius in the year of Rome 268 (a.c. 486), and had him executed. It has been noted as a remarkable fact, that for seven consecutive years from that time, one of the two annual consulships was filled by three brothers Fabii in rotation. Niebuhr has particularly investigated this period of Roman history, and speculated on the causes of this long retention of office by the Fabii as connected with the struggle then pending between the patricians and the plebeians, and the attempt of the former to monopolise the elections. ('*History of Rome*,' vol. ii., '*The Seven Consulships of the Fabii*.) One of the three brothers, Quintus Fabius Vibulanus, fell in battle against the Veientes, in the year 274 of Rome. In the following year, under the consulship of Cæso Fabius and Titus Virginii, the whole house of the Fabii proposed to leave Rome and settle on the borders of the territory of Veii, in order to take the war against the Veientes entirely into their hands. After performing solemn sacrifices, they left Rome in a body, mustering 306 patricians, besides their families, clients, and freedmen, and encamped on the banks of the Cremera in sight of Veii. There they fortified themselves, and maintained for nearly two years a harassing warfare against the Veientes and other people of Etruria. At last in one of their predatory incursions they fell into an ambuscade, and fighting desperately, were all exterminated. (Livy, ii. 48, 50; and Niebuhr's '*History*,' on the Veientine War.) One only of the house, Quintus Fabius Vibulanus, who had remained at Rome, escaped, and became the parent stock of all the subsequent Fabii. He was repeatedly consul, and was afterwards one of the decemviri with Appius Claudius for two consecutive years, in which office he disgraced himself by his connivance at the oppressions of his colleague, which caused the fall of the decemvirate. In subsequent years we find several Fabii filling the consulship, until we come to M. Fabius Ambustus, who was consul in the year 393 of Rome, and again several times after. He fought against the Hernici and the Tarquinians, and left several sons, one of whom, known by the name of Quintus Fabius Maximus Rullianus, attacked and defeated the Samnites (429 of Rome) in the absence and against the orders of his commanding officer, the Dictator Papirius, who would have brought him to punishment for disobedience, but was prevented by the intercession of the soldiers and the people. This Fabius was five times consul, and dictator twice. He triumphed over the Samnites, Marsi, Gauls, and Tuscani. His son, Quintus Fabius Gurgæ, was thrice consul, and was the grandfather of **QUINTUS FABIUS MAXIMUS VER-RUCOSUS**, one of the most celebrated generals of Rome. In his first consulate he triumphed over the Ligurians. After the Thrasymenian defeat he was named Prodictator by the unanimous voice of the people, and was intrusted with the salvation of the Republic. The system which he adopted to check the advance of Hannibal is well known. By a succession of skilful movements, marches, and counter-marches, always choosing good defensive positions, he harassed his antagonist, who could never draw him into ground favourable for his attack, while Fabius watched every opportunity of availing himself of any error or neglect on the part of the Carthaginians.

This mode of warfare, which was new to the Romans, acquired for Fabius the name of Cunctator, or 'temporiser,' and was censured by the young, the rash, and the ignorant; but it probably was the means of saving Rome from ruin. Minucius, who shared with Fabius the command of the army, having imprudently engaged Hannibal, was saved from total destruction by the timely assistance of the dictator. In the following year however, 536 of Rome, Fabius being recalled to Rome, the command of the army was intrusted to the consul T. Varro, who rushed imprudently to battle, when the defeat of Cannæ made manifest the wisdom of the dictator's previous caution. Fabius was made consul in the next year, and was again employed in keeping Hannibal in check. In 543 of Rome, being consul for the fifth time, he re-took Tarentum by stratagem, after which he narrowly escaped being caught himself in a snare by Hannibal near Metapontum. (Livy, xxvii. 15, 16.) When some years after the question was discussed in the senate of sending P. Scipio with an army into Africa, Fabius opposed it, saying that Italy ought first to be rid of Hannibal. Fabius died some time after at a very advanced age. His son, called

likewise Quintus Fabius Maximus, who had also been consul, died before him. His grandson Quintus Fabius Maximus Servilianus, being proconsul, fought against Viriatus in Spain, and concluded with him an honourable peace. (Livy, 'Epitome,' 54.) He was afterwards consul repeatedly, and also censor. He wrote 'Annals,' which are quoted by Macrobius. ('Saturni,' i. 16.) His brother by adoption Quintus Fabius Maximus Æmilianus, the son of Paulus Æmilius (Livy, xiv. 41), was consul in 609 of Rome, and was the father of Fabius, called Allobrogicus, who subdued not only the Allobroges, but also the people of Southern Gaul, which he reduced into a Roman province, called from that time 'provincia,' or 'Gallia ulterior.' Quintus Fabius Maximus, a grandson of Fabius Maximus Servilianus, served in Spain under Julius Caesar, and was made consul in the year 709 of Rome. Two of his sons or nephews, Paulus Fabius Maximus and Quintus Fabius Maximus were consuls in succession under Augustus. There was also a Fabius consul under Tiberius. Panvinus and others have reckoned that during a period of about five centuries, from the time of the first Fabius, who is mentioned as consul, to the reign of Tiberius, forty-eight consulships, seven dictatorships, eight censorships, seven augurships, besides the offices of master of the horse and military tribune with consular power, were filled by individuals of the Fabian house. It also could boast of thirteen triumphs and two ovations.

(Augustinus, *De Familiis Romanorum*.)

FABIUS PICTOR, the historian, was descended from Marcus Fabius Ambustus, the consul. Caius Fabius, one of the sons of Ambustus, was called Pictor, because about B.C. 304 he painted the temple of the goddess of health, which painting existed till the reign of Claudius, when the temple was burnt. (Pliny, xxxv. c. 4.) The surname of Pictor was continued to his children, one of whom, Caius Fabius Pictor, was consul with Ogulnius Gallus B.C. 271, and was the father of the historian. Quintus Fabius Pictor, the historian, lived in the time of the second Punic war, according to the testimony of Livy (xxi.), who says, in speaking of the battle of the Thrasymene Lake, that he followed in his narrative the authority of Fabius Pictor, who was contemporary with that memorable event. Fabius appears, from the testimony of Dionysius and Cicero, to have written both in Greek and in Latin. Of the extracts from or references to his 'Annals,' which have been transmitted to us, some concern the antiquities of Italy, and the beginning of Rome, others the subsequent fasti, or history of the Romans. He was the first who compiled a history of his country from the records of the pontiffs, and from popular tradition. He is spoken of with praise by Livy, who evidently borrowed largely from him, and by Cicero, Pliny, Appian, and others. Polybius however censures his obvious partiality for the Romans, and his unfairness towards the Carthaginians, in his account of the second Punic war. His 'Annals' are lost, with the exception of some fragments, which have been preserved by subsequent writers, and are printed in the collections of Antonius Augustinus, Antwerp, 1595, Antonius Riccobonus, Venice, 1688, and others. The well-known impostor, Annio da Viterbo, published a small work on the origin of Rome, under the name of Fabius Pictor, but the fraud was discovered. Quintus Fabius Pictor was sent by the senate to Delphi after the battle of Cannæ, to consult the Oracle about the ultimate result of the war. He must not be confounded with Servius Fabius Pictor, who lived in the time of Cato the Elder, and who is praised by Cicero for his knowledge of jurisprudence, literature, and antiquity.

FABRETTI, RAFFAELE, born at Urbino in 1810, was secretary of Pope Alexander VIII., and prefect of the papal archives in the castle of St. Angelo under Innocent XII. Fabretti spent most of his time in searching the ruins which are scattered about Rome and its neighbourhood, and digging for those which were under ground. He explored catacombs, columbaria, sepulchres, and other subterraneous receptacles; and he gathered an abundant harvest of antiquities, and chiefly of inscriptions, which he ranged in a collection at his house at Urbino, which collection has been since transferred to the ducal palace of the same town. It is related that the horse upon which he rode for many years in his perambulations through the Campagna, and which his friends had nicknamed Marco Polo, became so accustomed to his master's hunting after inscriptions that he used to stop of himself whenever he met with any. Fabretti wrote, 1°, 'Inscriptionum Antiquarum Explicatio,' fol., 1699; 2°, 'De Columnis Trajani,' fol., 1688, an elaborate work, in which he illustrated with much erudition and judgment the sculptures of that celebrated monument. He added to it an explanation of the Ilia table which is in the Capitoline Museum. 3°, 'De Aquis et Aqueductibus Veteris Romæ,' 4to, 1680, reprinted with notes and additions in 1788. Fabretti rendered great services to archaeology by his system of illustrating one monument by the help of another. Fabretti died at Rome in January 1700 at the age of eighty. He may be considered as the predecessor of Bianchini, Bottari, and other archaeologists who illustrated the antiquities of Rome during the 18th century.

FABRIANO, FRANCESCO DI GENTILE DA, commonly called GENTILE DA FABRIANO, was born at Fabriano, in the Marc of Ancona, about 1370. He was instructed by his father Niccolò in the physical and mathematical sciences, and was placed with Allegretto di Nuzio, called Critto da Fabriano, to learn painting. Gentile executed many works in fresco and a tempera at Gubbio and other cities of the

Marc of Ancona; and also at Orvieto, Florence, and Siena. He painted in 1423 a Madonna for the Cathedral of Orvieto, and he is styled in the register of the cathedral—"egregius magister imaginum." He painted in the same year at Florence a picture of the 'Adoration of the Kings,' for the sacristy of Santa Trinità, which is now in the gallery of the academy at Florence, and is one of its choicest pieces. But his masterpiece, according to Vasari, was an altar-piece of the Virgin, &c., in the church of San Niccolò at the gate of San Miniato, painted in 1425, now lost, with the exception of two fragments still in the church. Gentile worked also with great distinction at Venice and at Rome: he was presented by the Senate of Venice with the patrician toga, and a pension for life was granted to him for a painting in the council-chamber of the naval victory of the Venetians over the fleet of Frederic Barbarossa in 1177: it fell to pieces in the 16th century through damp. At Rome he painted some of the decorations of the church of San Giovanni in Laterano, ordered by Pope Martin V.; and a fresco of the 'Madonna and child with St. Benedict and St. Joseph,' over the tomb of Cardinal Adimari, in the church of Santa Maria Nuova; all of which have now perished. It was the latter work which excited the admiration of Michel Angelo, and led him to say that his style was like his name—Gentile.

The colouring and execution of Gentile were excellent for his period, and he was one of the most meritorious artists of his time. His works, though not to be compared with those of Masaccio, or even of Fra Giovanni da Fiesole, were an immense improvement upon the rigid meagre forms of Giotto and his school. Gentile taught Jacoppo Bellini at Venice, and that painter's son Gentile was Fabriano's namesake. Gentile left various writings on the origin and progress of art, on the mixing of colours, and on the art of drawing lines; but whether they still exist, does not appear. He died about 1450.

FABRICIUS, CAIUS, surnamed Luscinius, was consul for the first time in the year 471 of Rome, 283 B.C., when he triumphed over the Boii and the Etruscans. After the defeat of the Romans under the consul Lævinus by Pyrrhus (B.C. 281), Fabricius was sent by the senate as legate to the king to treat for the ransom of the prisoners, or, according to others, to propose terms of peace. Pyrrhus is said to have endeavoured to bribe him by large offers, which Fabricius, poor as he was, rejected with scorn, to the great admiration of the king. Fabricius being again consul (B.C. 279) was sent against Pyrrhus, who was then encamped near Tarentum. The physician to the king is said to have come secretly to the Roman camp, and to have proposed to Fabricius to poison his master for a bribe, at which the consul, indignant, had him put in fetters and sent back to Pyrrhus, upon whom this instance of Roman integrity made a great impression. Pyrrhus soon after sailed for Sicily, where he was called by the Syracusans, then hard pressed by the Carthaginians. Fabricius having defeated the Samnites, Lucanians, and Brutii, who had joined Pyrrhus against Rome, triumphed over those people. Pyrrhus, afterwards returning to Italy, was finally defeated and driven away by M. Curius Dentatus (B.C. 276). Two years after, Fabricius being consul for the third time, with Claudius Cinna for his colleague, legates came from king Ptolemy of Egypt to contract an alliance with Rome. Several instances are related of the extreme frugality and simplicity of the manners of Fabricius, which are conformable to what is recorded of the austerity of Roman life previous to the Punic wars. When censor, he dismissed from the senate P. Cornelius Rufinus because he had in his possession ten pounds' weight of silver plate. Fabricius died poor, and the senate was obliged to make provision for his daughters.

FABRICIUS, JOANNES ALBERTUS, born at Leipzig in 1667, early distinguished himself by his proficiency in classical literature, and his penetration and judgment, assisted by an excellent memory. Having finished his studies at Leipzig, he went to Hamburg, where I. F. Meyer appointed him his librarian. He was afterwards appointed professor in the college of Hamburg, where he remained to the end of his life, having refused several advantageous offers made to him by the landgrave of Hesse Cassel and others. He was the author of many elaborate works, the principal of which are:—'Bibliotheca Græca,' 14 vols. 4to, Hamburg, 1705-28. A new edition, with considerable improvements, was published by Harles, Hamburg, 1790-1809. The 'Bibliotheca Græca' is a most valuable work; it contains notices of all the Greek authors, from the oldest known down to those who flourished in the last period of the Byzantine empire, with lists of their works and remarks on them. 'Bibliotheca Latina,' 8 vols. 4to, 1708-21. The 'Bibliotheca Latina' is inferior in research and copiousness to the 'Bibliotheca Græca,' but is still a useful work, especially in the amended edition of Ernesti, Leipzig, 1773. 'Bibliotheca Latina Ecclesiastica,' fol., Hamburg, 1718. 'Bibliotheca Latina medicæ et infirmæ Ætatis, cum Supplemento C. Schoettgenii, ex recensione Dominici Mansi,' Padua, 6 vols. 4to, 1754. 'Memorie Hamburgenses,' 7 vols. 8vo; to which Reimar, the son-in-law of Fabricius, added an eighth volume in 1746. 'Codex Apocryphus Novi Testamenti,' 2 vols. 8vo, 1719; being a Collection of the false Gospels, Acts of the Apostles, and other apocryphal books which appeared in the early ages of Christianity. 'Bibliographia Antiquaria,' 4to, 1760; being notices of the authors who have written upon Hebrew, Greek, Roman, and ecclesiastical antiquities. 'Delectus Argumentorum et Syllabus Scriptorum qui veritatem Religionis Christianæ lucubrationibus suis

asseruerunt,' 4to, 1725. 'Hydrotheologia,' written in German, and translated into French under the title 'Théologie de l'Eau, ou Essai sur la Bonté, la Sagesse, et la Puissance de Dieu, manifestées dans la Création de l'Eau,' 8vo, La Haye, 1741. 'Codex pseudepigraphus Veteris Testamenti,' being a counterpart of his work on the Apocrypha of the New Testament. 'Conspetus Thesauri Litterarii Italici,' 8vo, 1749, or notices of the principal collections of the Historians of Italy, as well as of other writers who have illustrated the antiquities, geography, &c., of that country, including the great works of Burmannus and Grævius, with an account of the Italian literary journals existing or which had existed before the time of Fabricius, of the Italian academies, and a catalogue of Italian bibliographers and biographers classed according to the particular towns which they have illustrated. 'Imp. Cæs. Augusti Temporum Notatio, Genus et Scriptorum Fragmenta,' with 'Nicolaï Damasceni De Institutione Augusti,' 4to, 1727. 'Salutaris Lux Evangelii, sive Notitia Propagatorum per Orbem totum Sacrorum: accedunt Epistolæ quædam ineditæ Juliani Imperatoris, Gregorii Habessini Theologia Æthiopica, necnon Index geographicus Episcopatum Orbis Christiani,' 4to, 1731; a work which contains useful information for students of ecclesiastical history. 'Centifolium Lutherani, sive Notitia Literaria Scriptorum omnis generis de Martino Luthero, ejus Vita, Scriptis, et Reformatione Ecclesiæ editorum,' 2 vols. 8vo, 1730. 'Centuria Fabriciorum Scriptis clarorum qui jam diem suam obierunt collecta,' 2 vols. 8vo, 1709, with a continuation in 1727. The author has included in his list not only the authors whose name or surname was Fabricius, but also those whose names may be turned into the Latin Fabricius; such as Le Fevre, Fabri, the German Schmidts, &c. Independently of the above and other minor works, Fabricius published editions of Sextus Empiricus, of the Gallia Orientalis of Father Colomies, of the works of St. Hippolytus, and many others. The catalogue of the works published by him exceeds 100. Fabricius died at Hamburg in April 1736, in his sixty-ninth year. His private character was as praiseworthy as his learning was great. He was modest, hospitable to strangers who came to visit him, indefatigable in the duties of his professorship and rectorship, and yet he found time for the compilation of the numerous works already mentioned. Reimar, his son-in-law, wrote his biography in Latin, 8vo, 1732.

FABRICIUS, JOHANN CHRIST, was born in the year 1742 at Tundern, in the duchy of Sleswick. He was brought up to the medical profession, and at the age of twenty-three was made professor of natural history and rural economy at Kiel.

Fabricius studied under Linnæus, and afterwards enjoyed perhaps a more brilliant reputation than any other pupil of that great naturalist. He was early induced, by the circumstance of Linnæus quoting him in his 'Systema Nature,' especially to devote himself to the study of entomology, a science at that time in its infancy. The first results of his investigations were made known in 1775 in his 'Systema Entomologicæ,' where he proposed a new arrangement of the insect tribe, the novelty of which consisted in choosing for his divisions the modifications observable in the parts of the mouth. Fabricius subsequently published numerous other works of still greater importance, a list of which is given at the end of this article. Possessing a great knowledge of languages, Fabricius travelled through the northern and middle states of Europe, collecting new materials, and frequenting the various museums, from which he described all such insects as had hitherto been unpublished. Accounts of his travels in Norway, Russia, and England, were published by him. He visited England seven times, and received great assistance from inspecting the collections of Sir Joseph Banks, John Hunter, Drury, Francillon, and others.

Although chiefly known as an entomologist, Fabricius was not a stranger to other branches of zoology; he was also versed in botany and mineralogy. He died of dropsy, in his sixty-fifth year. His principal works are:—'*Systema Entomologicæ, sistens Insectorum Classes*,' &c., 1 vol. 8vo, Flensburgi et Lipsiæ, 1775; '*Philosophia Entomologica*,' 8vo, Hamburgi et Kilonii, 1778; '*Reise nach Norwegen, mit Bemerkungen aus der Natur Historie und Æconomie*,' 8vo, Hamburg, 1779; '*Species Insectorum, sistens eorum differentias specificas, synonymia auctorum, loca natalia, metamorphosis*,' &c., 2 vols. 8vo, Hamburgi et Kilonii, 1781; '*Mantissa Insectorum, sistens species nuper detectas*,' &c., 2 vols. 8vo, Hafniæ, 1787; '*Genera Insectorum*,' 1 vol. 8vo (Chilonii), Kiel, 1776; '*Entomologia Systematica, emendata et aucta*,' 4 vols. 8vo, Hafniæ, 1792-93-94; '*Index Alphabeticus*,' 1796; '*Supplementum Entomologicæ Systematicæ*,' 1 vol. 8vo, Hafniæ, 1798; '*Systema Eleuteratorum*,' 2 vols. 8vo, Kiliz, 1801; '*Index*,' 8vo, Kiliz, 1802; '*Systema Rhyngotorum*,' 8vo, Brunsvigæ, 1801; '*Index Alphabeticus Rhyngotorum, genera et species continens*,' quarto, Brunsvigæ, 1803; '*Systema Piezatorum*,' 8vo, Brunsvigæ, 1804; and '*Systema Antliatorum*,' 8vo, Brunsvigæ, 1805.

FABRIZIO, GERO'NIMO, commonly called FABRICIUS AB ACQUAPENDENTE, was born in 1537 at Acquapendente in Italy, a city near Orvieto, in the Papal States. His parents, although poor, contrived to furnish him with the means of obtaining an excellent education at Padua, which was then rapidly approaching the eminence it long held, especially as a school of medicine, among the universities of Europe. He became at an early age a pupil of Fallopius, who then held the chair of anatomy and surgery at Padua, and speedily attracted

the attention and goodwill of his instructor; and so well did he avail himself of the advantages thus opened to him, that he was appointed on the death of Fallopius in 1562 to succeed him in the direction of the anatomical studies of the university, and three years later to the full emoluments of the professorship. The growing perception of the importance of anatomical knowledge led in 1584 to the institution of a separate chair for the teaching of that branch of medicine, which however Fabricius appears to have still held in conjunction with that of surgery up to a late period of his life, with the able assistance of Casserius.

His reputation as a teacher drew students from all parts of Europe, till at length the theatre of anatomy, built originally by himself, became so crowded, that the Venetian senate provided him in 1593 with another of ample dimensions at the public expense; and at the same time added largely to his salary, and granted him many exclusive privileges and titles of honour. The fame and wealth he derived from his practice as a surgeon was even more than equal to that which he enjoyed as an anatomist, and after upwards of fifty years of uninterrupted prosperity he retired from public life the possessor of an enormous fortune and the object of universal esteem. Yet he does not appear to have found the contentment he sought in his retirement. His latter years were embittered by domestic dissensions and the unfeeling conduct of those who expected to become his heirs, and he died in 1619, at the age of eighty-two, not without the suspicion of poison, at his country-seat on the banks of the Brenta, still known as the Montagnuola d'Acquapendente.

The name of Fabricius is endeared to the cultivators of his science by the circumstance of his having been the tutor of William Harvey, whose discovery of the circulation of the blood (by far the most important yet achieved in physiology) was suggested, according to his own statement, by the remarks of Fabricius on the valvular structure of the veins. The title of Fabricius to the minor discovery has been disputed, though strongly asserted by some anatomists. The truth is, that his merit did not so much consist in original discovery as in the systematic arrangement and dissemination of the knowledge acquired by his predecessors. It is as a practical surgeon that he is now chiefly remembered: the observations recorded in his works having however been since wrought up in the general body of surgical knowledge, are now seldom consulted or quoted specifically as derived from himself.

Fabricius published many tracts both in anatomy and surgery. Those on anatomy and physiology, often referred to, but not with unmixed praise, by Harvey and the writers of the period immediately subsequent to his own, were collected in one volume folio, and republished, with a biographical memoir of the author, by Albinus at Leyden in 1738. The best edition of his surgical works, the twenty-fifth, was printed, also in one folio volume, at Padua in 1666. His writings are all in Latin, and display a considerable knowledge of the literature, general and medical, of that language and of the Greek.

FABROT, or FABROTUS, CHARLES-ANNIBAL, a jurist, was born at Aix, in Provence, in 1580 or 1581. In the memoirs of the French jurists the names and conduct of their patrons generally occupy an important position: among those who were instrumental in bringing Fabrot into notice occur the names of two distinguished men, Fabri de Peiresc and Bignon the avocat-general. With an interval of a short residence in Paris in 1617, Fabrot appears to have taught law in the University of Aix from the year 1609 to 1637, when he went to Paris to print his edition of the 'Institute of Theophilus,' or the Greek version of Justinian's 'Institute' ('*Institutionum Justiniani Imperatoris Paraphrasis Græca*, etc., recensuit, et Scholiis Græcis auxit, Car. Annibal Fabrotus'). Having got access to the manuscripts in the possession of Cujacius, and to others in the public libraries, he long laboured in the preparation of an edition of the 'Basilica,' which, containing a version of the several parts of the 'Corpus Juris,' and also the additions made under the Eastern emperors, were, unless through the fragments edited in Latin by Hervetus, known to the jurists only in manuscript. Fabrot's edition was published at Paris in 1647 in 7 vols. folio ('*Basilicorum Libri Sexaginta, cum Versione Latina C. A. Fabroti et aliorum*'). This edition contains thirty-three complete and ten incomplete books of the sixty. In 1658 Fabrot edited at Paris the works of Cujacius, in 10 vols. folio; a well-known edition, but not well provided with means of reference. The labour connected with this work is said to have occasioned the death of its editor: he died at Paris on the 16th of January 1759. He wrote several minor works on jurisprudence, and some on the science now called medical jurisprudence, e.g., '*Disquisitiones duæ: prior de Justo Partu—altera de Numero Puerperii*.' Some of these minor works are in the '*Thesaurus Juris Romani*' of Everard Otto.

FABYAN, ROBERT, the historian, was descended from a respectable family of Essex. Bishop Tanner says he was born in London. We have no dates of his early life, but he is known to have belonged, as a citizen, to the Company of Drapers. From records in the city archives, it appears that he was alderman of the ward of Farringdon Without, and in 1493 served the office of sheriff. In 1496, in the mayoralty of Sir Henry Colet, we find him "assigned and chosen," with Mr. Recorder and certain commoners, to ride to the king "for redress of the new impositions raised and levied upon English cloths

in the archduke's land," (that is, the Low Countries), an exaction which was desisted from in the following year. In 1502, on the plea of poverty, he resigned the alderman's gown, not willing to take the mayoralty, and probably retired to the mansion in Essex, mentioned in his will, at Theydon Gernon. That he was opulent at this period cannot be doubted, but he seems to have considered that the expenses of the chief magistracy, even at that time, were too great to be sustained by a man who had a numerous family. He ordered the figures, as may be seen in his will, of sixteen children, in brass, to be placed upon his monument. Stow, in his 'Survey of London' (edit 1603, p. 108), gives the English part of the epitaph on Fabyan's tomb, from the church of St. Michael, Cornhill, and says he died in 1511, adding that his monument was gone. Bale, who places Fabyan's death on February 28th, 1512, is probably nearest to the truth, as his will, though dated July 11, 1511, was not proved till July 12, 1513. Fabyan's will, printed with the last edition of his 'Chronicle,' affords a curious comment on the manners of the time of Henry VIII.

There have been printed five editions of Fabyan's 'Chronicle.' The first was printed by Pynson in 1516, and is of great rarity, in a perfect state. Bale says that Wolsey ordered many copies of it ('exemplaria nonnulla') to be burnt. The second was printed by Rastell in 1533; the third in 1542 by Reynes; the fourth in 1559 by Kyngeston. The changes of religion gave rise to many alterations and omissions in the third and fourth editions; but all the editions, as well as a manuscript of the second part of the book, were collated by Sir Henry Ellis for the fifth edition, 4to, London, 1811, from the preface to which the present account of the historian has been principally taken. Fabyan, whose object was to reconcile the discordant testimonies of historians, named his book 'The Concordance of Histories,' adding the fruits of personal observation in the latter part of his 'Chronicle.' The first edition had no regular title; the latest is called 'The New Chronicles of England and France, in two parts, by Robert Fabyan, named by himself the Concordance of Histories.' The first edition, which may be considered as Fabyan's genuine work, extends from the time when "Brute entryd firste the Ile of Albion" to 1485; the second continued the history to 1509; the third to 1541; and the fourth to the month of May 1559. The names of the several authors who were the continuators are unknown.

FACCIOLATI, JACOPO, was born in 1682 at Torriggia on the Euganean Hills, in the province of Padua. He studied first in the college of Este, and was afterwards placed by Cardinal Barbarigo, bishop of Padua, in the clerical seminary of that city, where he completed his studies and was admitted into holy orders. He was then appointed teacher and afterwards prefect or superior of the same establishment. The seminary of Padua had then as subsequently a high reputation as a place for the study of Latin and for the numerous and generally accurate editions of the classics and other school-books which have come from its press. Facciolati contributed to support this reputation by his labours. Among other works he published improved editions of the 'Lexicon' of Schrevelius, of the 'Thesaurus Ciceronianus' of Nizolius, and of the vocabulary of seven languages, known by the name of 'Calopino,' 2 vols. fol., 1731. In this last undertaking he was greatly assisted by his pupil, Egidio Forcellini, although he was not willing to acknowledge the obligation. The work however being still incomplete, J. B. Gallizoli made a new edition of the 'Calopino,' 2 vols. fol., Venice, 1778, and added many oriental and other words. It was in the course of his joint labours with Facciolati that Forcellini conceived the plan of a totally new Latin Dictionary, which, after more than thirty years assiduous application, he brought to light under the title of 'Totius Latinitatis Lexicon,' 4 vols. fol., Padua, 1771. This work has superseded all other Latin dictionaries. Forcellini, more generous than Facciolati, acknowledged in the title-page of his work that its production was in great measure due to the advice and instruction of his deceased master. The manuscript of his 'Lexicon,' in 12 vols. fol., is preserved in the library of the seminary. A new edition of Forcellini's 'Lexicon' was published some years back by the Abate Furlanetto of the same institution.

In 1722, Facciolati being appointed professor of logic in the university of Padua, delivered a series of introductory Latin discourses to the students of his class, which were received with considerable applause. In 1739 he began to write in Latin the 'Fasti of the University of Padua:' the introductory part, in which he describes the origin, the laws and regulations, and the object of that celebrated institution, is very well written, but the 'Fasti' themselves contain little more than dry lists of the successive professors, with few and unimportant remarks. His Latin epistles, as well as his 'Orations,' or discourses, have been admired for the purity of their diction. The king of Portugal sent Facciolati a flattering invitation to Lisbon to take the direction of the public studies in his kingdom, but Facciolati declined the offer on account of his advanced age. He however wrote instructions for the re-organisation of the scholastic establishments of that country, which had become necessary after the expulsion of the Jesuits. Facciolati died at Padua in 1769, in his eighty-eighth year. He left numerous works, mostly in Latin, besides those already mentioned.

FAHRENHEIT, GABRIEL DANIEL, an able experimenter in natural philosophy, was born at Danzig near the end of the 17th

century, but the precise year of his birth is unknown. His father intended that he should engage in a mercantile occupation, but his own taste inclining strongly to scientific pursuits, he used every opportunity of employing himself in such physical researches as his circumstances permitted.

Having travelled through different parts of Germany in order to acquire information respecting the subjects of his studies, he finally established himself at Amsterdam as a maker of philosophical instruments.

Fahrenheit considerably improved the thermometer; but he is chiefly distinguished for the invention of that particular scale which he applied to thermometers, and which has ever since been generally in use in this country. The fluid which he employed in the construction of the thermometer was mercury; and to the bulb, instead of a globular he gave a cylindrical form. The graduations were generally executed on paper which was wrapped about and made to adhere to the tube, and the instrument was contained in a glass cylinder.

Fahrenheit was elected a Fellow of the Royal Society of London in 1724; and in the 'Philosophical Transactions' for that year are papers by him on the heat of liquids in a state of ebullition; on the freezing of water in vacuo; on the specific gravity of certain bodies; also on an improved barometer and thermometer. He contrived a machine which he intended to be used for the purpose of draining marshes; but he died in 1740, before completing it.

FAIRBAIRN, WILLIAM, civil engineer and machinist, has been associated with many of the important mechanical and structural works executed during some years past. He was born at Kelso on the Tweed, in 1789; was educated as a mechanic near Newcastle-upon-Tyne; and after working at his trade in London and Manchester, commenced business in partnership with Mr. Lillie about the year 1817. The firm was known as that of the leading machine-makers of Manchester up to about twenty years ago, when the partnership was dissolved, Mr. Fairbairn continuing the same business. Amongst Mr. Fairbairn's improvements may be named the introduction of light shafting, and contrivances for driving the machinery of factories more simple than those previously in use; modifications in valves of steam-engines; and the introduction of the double-flued boiler for alternate firing, productive of economy in fuel and consumption of smoke; improvements in the feeding apparatus of mill-stones; the adoption of a better principle of suspension, and the use of ventilated buckets in water-wheels; the invention of the rivetting machine; and about the year 1833, the introduction, which is claimed for him, of a more ornamental style in the architecture of factories. In the year 1830 or 1831 he made some important experiments on the form and traction of boats, on the Forth and Clyde Canal, which he published in the latter year. His attention was thereby directed to the advantage of iron as a material for ship-building, and one of his works was a small sea-going vessel, which, being constructed in Manchester, was conveyed through the streets and down the nearest water-way to its destination. This is believed to have been one of the earliest essays in iron ship-building, which Mr. Fairbairn began to develop in 1836 in the construction of vessels of the largest class, at the premises since occupied by Mr. J. Scott Russell, at Millwall, London. A year or two later, Mr. Fairbairn made one of the first attempts in iron house and store building, in the designing and construction of a corn-mill; the castings and other iron-work for which were sent out to Constantinople, where the building was erected and is still in use. Mr. Fairbairn was one of the early members of the British Association for the Advancement of Science, to which the results of his most valuable researches have been communicated. At his works were made an important series of experiments on the comparative strength of hot and cold blast iron; Mr. Hodgkinson's experiments by which was determined the best form of section for iron beams; and others with reference to the strength of certain materials under specific conditions. Particulars of these may be found in the 'Transactions of the British Association,' the 'Philosophical Transactions,' the 'Transactions of the Literary and Philosophical Society of Manchester,' and other publications. When the means for crossing the Menai Strait by the Chester and Holyhead railway were under consideration, Mr. Fairbairn's practical and theoretical knowledge of wrought and cast iron as materials, and of the available disposition of them in the best form for strength obviously pointed to him as an authority to be consulted. The relative portions of the merit due to Mr. Fairbairn and Mr. Stephenson ultimately became the subject of somewhat angry dispute, much being said and written on both sides. With the strength and other advantageous properties of rivetted boiler plates Mr. Fairbairn was of course well acquainted. Doubtless very high merit is due to all parties. [STEPHENSON, ROBERT.] Mr. Fairbairn and Mr. Hodgkinson engaged upon an elaborate series of experiments, some of which produced unexpected results; and from those experiments the best form and dimensions of the tubes were deduced, and they have perhaps mainly led to the general use of wrought iron plate girders in ordinary building operations, as well as in railway engineering. The same investigations have also contributed to the present extensive use of iron in ship-building. For the use of that material Mr. Fairbairn is a consistent advocate. In the 'Philosophical Transactions' for 1850, appeared his 'Experimental Enquiry into the strength of Wrought Iron Plates, and their rivetted joints, as applied to Ship-building and Vessels exposed to severe strains;' and he has made many researches

into the causes which lead to explosions in steam-boilers, in reference to which and to cases of fracture in girders, his evidence has often proved of value. Mr. Fairbairn recently delivered a series of lectures to working engineers of Yorkshire and Lancashire, on boilers and explosions, on the consumption of fuel, on iron ship-building, the nature of heat and other subjects, and these have been lately published under the title, 'Useful Information for Engineers.' He is also the author of works on the construction of the Britannia and Conway Bridges, and on the Application of Cast and Wrought Iron Beams in Floors and Bridges. He is a Fellow of the Royal Society, fills the chair of Dalton in the Literary and Philosophical Society of Manchester, is a corresponding member of the National Institute of France, and has received marks of respect from the chief sovereigns of Europe.

FAIRFAX, EDWARD, was the second son of Sir Thomas Fairfax, of Denton in Yorkshire. The date of his birth is unknown; but as his translation of Tasso's 'Jerusalem Delivered' was published in 1600, we may suppose that it fell some time in the reign of Queen Elizabeth. Contrary to the habits of his family, who were of a military turn, he led a life of complete retirement at his native place, where his time was spent in literary pursuits, and in the education of his own children and those of his brother, one of whom became the father of the celebrated Lord Fairfax. We learn from his own writings that he was neither 'a superstitious Papist nor a fantastic Puritan,' but farther particulars of his life there are none. He is supposed to have died about the year 1632.

Fairfax is now known only for his translation of Tasso's 'Jerusalem Delivered,' which is executed in a manner which makes it wonderful how the frigid, jingling, and affected version by Hoole ever survived its birth. The measure which he chose for his work (that of the original Italian) is one less stately perhaps than the Spenserian stanza, but not less fitted for heroic subjects. It consists of eight-line stanzas, of which the first six lines are in *terza rima* and the last two rhyme with each other. It has this great superiority over the common heroic couplet, that all jingle is avoided by the occasional introduction of a different species of rhyme. Moreover the verses are much more harmonious than those of Hoole; the diction is more simple, and the English more pure. Now perhaps most readers would smile at the assertion of Hoole in the Preface to his translation of Tasso, that Fairfax's translation "is in stanzas that cannot be read with pleasure by the generality of those who have a taste for English poetry;" but we must at the same time regret that a literary school like that of the followers of Pope should have usurped for so long a time such entire dominion as to enable one of its humblest members to make assertions so sweeping and insolent as those contained in the preface from which we have just quoted. Fairfax's studies were to a great extent of a theological and metaphysical turn, and he was induced to undertake the defence of the doctrine and discipline of the Church of England in reply to one Dorrel, a Roman Catholic, but his writings on this subject have never been published. He also paid a good deal of attention to the subject of demonology, in which he was a believer, and he left a manuscript treatise, entitled 'A Discourse of Witchcraft, as it was acted in the family of Mr. Edward Fairfax of Faystone, in the county of York, in the year 1621.'

FAIRFAX, SIR THOMAS, afterwards Lord Fairfax, the son of Ferdinando Lord Fairfax and his wife, Mary, daughter of Edmund Sheffield, Lord Mulgrave, was born at Denton, about twelve miles N.W. from Leeds. He was sent from school to St. John's College, Cambridge; but his disposition inclined him to military employment rather than to study. Accordingly, as soon as he left college, he enlisted in the army of Lord Vere, and served under his command in Holland. The connection of Fairfax with Lord Vere afterwards became more close. When he returned to England, he married Anne, the fourth daughter of that peer, who, like her father, was a zealous Presbyterian, and disaffected to the king. When the king began to raise troops, as it was said, for the defence of his person, Fairfax, who foresaw that it was intended to collect an army, in the presence of nearly 100,000 people assembled on Heyworth Moor, presented a petition to the king in person, praying that he would listen to his parliament and refrain from raising forces. In 1642, when the civil wars broke out, he accepted a commission of general of the horse under his father, who was general of the parliamentary forces in the north. His first employment was in the county of York, where at first the greater number of actions between the parliamentary and royalist troops were in favour of the king, whose army was under the conduct of the Earl of Newcastle. Sir Thomas Fairfax, somewhat dispirited, was despatched from Lincoln, where he was in quarters, to raise the siege of Nantwich, in Cheshire. In this expedition he was not only successful in the main object, but he also took several garrisons, and on his return defeated the troops under Colonel Bellasis, the governor of York, and effected a junction with his father's forces (April, 1644). Thus Fairfax became master of the field, and, in obedience to his orders, proceeded towards Northumberland, to enable the Scots to march southwards, in spite of the king's forces, which were quartered at Durham. A junction took place between the Scots and Fairfax, who acted in concert during the spring (1644), and fought together in the memorable battle of Marston Moor (July 2, 1644), where the king's troops experienced such a signal defeat that the whole north,

with the exception of a few garrisons, submitted to the parliament. Before Helmsley Castle, one of these fortresses, which Sir Thomas Fairfax was afterwards (September) sent to besiege, he received a wound in his shoulder that caused his life to be despaired of. When the Earl of Essex ceased to be parliamentary general [Essex], it was unanimously voted that Fairfax should be his successor (January 1644-45), and Cromwell, by whom his actions were afterwards so greatly influenced, was appointed his lieutenant-general. Fairfax hastened to London, where, upon the receipt of his commission, the speaker paid him the highest compliments. After having been nominated governor of Hull, he marched to the succour of Taunton, in which place the parliamentary troops were closely besieged; but upon the king's leaving Oxford and taking the field with Prince Rupert, he was recalled before he had proceeded farther than Blandford, and received orders to join Cromwell and watchfully attend upon the movements of the king. On the 14th of June he commanded the parliamentary forces at the decisive battle of Naseby; and when the king had fled into Wales, Fairfax, marching through Gloucester, possessed himself of Bath, Bristol, and other important posts in Somersetshire. From thence, by the way of Dorsetshire, he carried his arms into Cornwall, and entirely dispersed the forces of the king.

After the surrender of Exeter, which was the last event of this western campaign, Fairfax returned to Oxford, which as well as Wallingford, surrendered upon articles. In the autumn, after further active and successful employment, he was seized with a fit of illness under which he laboured for some weeks. In November, when he returned to London, he was welcomed by crowds who came out to meet him on his road, was publicly thanked for his services, and received from the parliament a jewel of great value set with diamonds, together with a considerable grant of money. The payment of the 200,000*l.* to the Scottish army, in consideration of which they delivered up the king, was entrusted to Fairfax, who marched northward for this purpose. The discontent of the army, who were fearful either that they should be disbanded or sent to Ireland, now rose to a great height. Their complaints were encouraged by Cromwell and Ireton; a council was formed in the army by selecting two soldiers from each troop, and the Independents showed an evident desire to form a party distinct from the Presbyterians and the parliament, and to usurp for themselves a greater authority. Fairfax saw these violent proceedings with regret, but he had not the resolution to resign his command. He succumbed before the greater genius of Cromwell, following his counsels, until the army had become master both of the parliament and the kingdom.

In 1647 he was made Constable of the Tower; and in the following year, at his father's death, he inherited his titles, appointments, and estates. The difference of his condition made no alteration in his life; he continued to attack or besiege the royal troops wherever they were mustered or entrenched. Many towns in the east, and among them Colchester, which he treated with great severity, yielded to his arms. In December he marched to London, menaced the parliament and quartered himself in the palace at Whitehall. He was named one of the king's judges, but refused to act; and he was voted one of the new council of state (February 1648-49), but refused to subscribe the test. In May he marched against the Levellers, who were numerous in Oxfordshire. He continued in command of the army until June 1650, when, upon the Scots declaring for the king, he declined marching against them, and consequently resigned his commission. He now retired to his house at Nun Appleton, in Yorkshire, which for some years he made his principal residence. He left it (in 1659) to assist General Monk against Lambert's forces. In January 1659-60, he made himself master of York. In the same month and in the February following he was chosen one of the council of state by the Rump Parliament, was elected one of the members for the county of York, and formed one of the committee appointed to promote the return and restoration of Charles II. In November 1671, while residing privately at his country-house, he was seized with an illness, which terminated in his death. He was buried at Bilburgh, near York. He left issue two daughters, Mary, who married the Duke of Buckingham, and Elizabeth, of whom we have no account.

FAITHORNE, WILLIAM. This distinguished English engraver of the time of Charles I. was born in London, but in what year is not known. He was instructed by Mr. (afterwards Sir Robert) Peake, painter and printseller, with whom he worked three or four years before the breaking out of the rebellion; and when Sir Robert Peake was made lieutenant-colonel, and intrusted with a command in Basing-House, Faithorne enlisted under him, and they were both taken prisoners together. Faithorne was brought to London and confined in Aldersgate, where he resumed the graver; he was however shortly afterwards released and permitted to go to France. He returned about 1650, and opened a print-shop in the Strand, near Temple Bar, and prosecuted his art at the same time. About 1680 he gave up this shop, removed to Printing-House Yard, Blackfriars, and in addition to engraving pursued portrait-painting in crayons. He died in 1691, and was buried in St. Anne's, Blackfriars.

In 1662 Faithorne published a treatise on engraving, dedicated to Sir Robert Peake, entitled, 'The Art of Graveing and Etching, wherein is expressed the true way of Graveing in Copper. Also the Manner

and Method of that famous Callot, and M. Boese, in their several ways of Etching.

Walpole has given a considerable list of Faithorne's prints, of which the following are some of the best:—His own 'Head' looking over his shoulder, with long hair; 'Sir William Paston, Bart.,' 1659, which Walpole terms his most perfect work; 'Lady Paston,' same date, probably after Vandyck; 'Margaret Smith,' widow, wife of Sir Edward Herbert, after Vandyck; 'Montagu Bertie,' second Earl of Lindsey, after Vandyck; 'Sanderson,' 1658, prefixed to his 'Graphice,' after Zouat; 'Anne Bridges,' Countess of Exeter, after Vandyck; 'Thomas Hobbes, stat. seventy-six; 'Henrietta Maria,' with a veil, executed in Paris; a large full length emblematical print of 'Cromwell,' in armour; 'Queen Catherine,' in the dress in which she arrived in England; 'Barbara, Countess of Castlemaine; 'Prince Rupert,' after Dobson; 'Dr. Harvey,' bust on a pedestal; 'Sir Thomas Fairfax,' after Walker; 'John Milton, stat. sixty-two,' drawn by Faithorne himself, &c.; and four illustrations to Taylor's 'Life of Christ,' the 'Last Supper,' 'Christ Praying in the Garden,' the 'Scourging,' and the 'Marriage of Cana.' His works were chiefly portraits. His son William, called William Faithorne the Younger, engraved portraits in mezzotint, but he was of dissipated habits, and he died towards the close of the 17th century, aged about thirty. There are heads by him of 'Mary, Princess of Orange,' 'Queen Anne,' 'Prince George of Denmark,' 'Charles XII. of Sweden,' 'Dryden,' &c.

FALCONER, WILLIAM, was born about 1730, being one of a large family, all of whom, except himself, were deaf and dumb. When very young, he served his apprenticeship on board a merchantman, and was afterwards second-mate of a vessel in the Levant trade, which was shipwrecked on the coast of Attica, himself with two others being the only survivors. This event laid the foundation of Falconer's fame, by forming the groundwork of 'The Shipwreck,' which poem he published in 1762. The notice which the poem received enabled him to enter the navy, during the ensuing year, as midshipman in the 'Royal George.' After some other appointments, he became purser to the 'Aurora' frigate, and was lost in her somewhere in the Mozambique Channel, during the outward voyage to India, in the winter of 1769.

Falconer was the author of a 'Nautical Dictionary' of considerable merit, as well as of some minor poems; but his chief claim to reputation consists in 'The Shipwreck,' the merit of which is owing to the vividness and power of description which pervade the work, and to the facility the author has shown in introducing nautical language. His style is formed on that of Pope; and the mixture of phrases, such as 'weather back-stays,' 'parrels, lifts, and clew-lines,' with the affectations of 'nymph,' 'swain,' 'Paphian graces,' &c., form rather a ludicrous contrast. To call 'The Shipwreck' a first-rate poem, or to compare it with the *Æneid* of Virgil, would not now enter into many men's thoughts, although this was done at the time when it first appeared; but after making every abatement, it must be allowed that Falconer has done what no one else has attempted, and we must give him a high place among the writers of didactic poems.

FALCONER, WILLIAM, M.D. This eminent physician, who resided many years in Path, was the author of many professional and literary productions, which obtained for him from Dr. Parr the character of "a man whose knowledge is various and profound, and whose discriminations upon all topics of literature are ready, vigorous, and comprehensive." He was the son of William Falconer, Recorder of Chester, was born in 1744, and died in 1824. His numerous books and tracts combine the accurate knowledge of the physician with the enlarged views of the philosopher. His 'Remarks on the Influence of Climate, Situation, Nature of Country, Population, Food, &c. on the Disposition and Temper, Manners, Laws and Customs, Government, and Religion of Mankind,' 1782, is a work that may be read with advantage; and so his 'Dissertation on the Influence of the Passions on the Disorders of the Body,' to which the first Fothergillian gold medal was awarded.

Dr. Falconer's only child, the REV. THOMAS FALCONER, was born in 1772, and died in 1839. He was educated at Corpus Christi College, Oxford, of which he was a Fellow, and was Bampton Lecturer in 1810. In 1797 he published a translation of the 'Periplus' of Hanno; and he took a large share in editing the Oxford edition of Strabo. Although occasionally performing the duties of a clergyman, he declined receiving any church preferment, and in 1823 took the degree of M.D. at Oxford. Under his learned father he had made medicine his assiduous study; and during the years of his long residence at Bath he was unremitting in giving gratuitous medical advice to all afflicted persons who sought his aid. Possessed of a handsome competency, his private charities were as liberal as they were unostentatious. His second son, THOMAS FALCONER, was called to the Bar in 1830. He is the author of many able articles and pamphlets on the public topics of his day, especially on The Oregon Question, on Canadian Affairs, and on Texas, through which country and Mexico he travelled in 1841-42. In 1850 he was chosen as one of the arbitrators to determine the boundaries between the provinces of Canada and New Brunswick. In 1851 he was appointed a Judge of the County Courts of Glamorgan-shire, Brecknockshire, and Radnorshire. Descended from a family distinguished by their cultivation of letters, Mr. Thomas Falconer has honourably maintained the reputation of the name he bears.

FALCONET, ETIENNE-MORIA, was born in 1716, of poor parents, at Vivay in Switzerland. His parents early removed to Paris, and there he studied sculpture under Lemoine, whom he soon surpassed. He executed several groups and statues, which are at Paris, in the church of St. Roch, in the Musée des Monuments Français, and in several private collections. In 1766 he accepted the invitation of Catharine II. to repair to Petersburg, in order to execute the colossal statue of Peter the Great. He remained in that capital twelve years, during which he completed his work, which is now in the square called the Square of the Senate, and is by far his most celebrated production. As he and the Russian founder appointed to cast the statue could not agree, Falconet cast it himself. He placed it upon an enormous block of granite, weighing about 1700 tons, which was found in some marshy ground at a considerable distance from Petersburg, and was brought to the capital by machinery. Catharine, who had shown him the greatest attention during the first years of his residence in the Russian capital, grew cool towards him at last, owing to the misrepresentations of some of her courtiers. Falconet returned to Paris in 1778. In May 1788, as he was going to set off for Italy, a country which he had never visited, he had a paralytic stroke. He survived however till January 1791. Falconet wrote strictures and commentaries on the books of Pliny which treat of the sculpture and painting of the ancients: he also wrote 'Observations sur la Statue de Marc Aurèle.' In general Falconet had no great veneration for ancient art. His writings were collected and published under the title, 'Œuvres Complètes de Falconet,' 6 vols. 8vo, Lausanne, 1782, and reprinted in 3 vols. 8vo, Paris, 1808, to which is prefixed an account of his life.

FALKLAND, HENRY CARY, VISCOUNT, descended from the Carys of Cockington, was the son of Sir Edward Cary of Berkhamsted and Aldenham in Hertfordshire, at which latter place he was born late in the reign of Queen Elizabeth. When about sixteen years of age, he was sent to Exeter College, Oxford; but he left that university without taking a degree. In 1608 he was made one of the Knights of the Bath, at the creation of Henry, prince of Wales; and in 1617 he was sworn in comptroller of his majesty's household, and made one of his privy council. On the 10th of November 1620 he was created Viscount of Falkland, in the county of Fife, in Scotland. King James I., knowing his abilities and experience, constituted him Lord Deputy of Ireland, into which office he was sworn September 18th, 1622, and continued in it till 1629. During his administration he is said to have kept a strict hand over the Roman Catholics in that kingdom, which gave them occasion to send complaints to the court of England against him, till, by their clamour and prevailing power, he was removed in disgrace. Leland, in his 'History of Ireland,' has given the character of his government. "Lord Falkland," he says, "seems to have been more distinguished by his rectitude than abilities. In a government which required vigour and austerity, he was indolent and gentle: courting rather than terrifying the factious. He was harassed by the intrigues and clamours of the king's ministers, whom he could not always gratify to the full extent of their desires; his actions were severely maligned at the court of England; his administration in consequence was cautious and embarrassed. Such a governor was little qualified to awe the numerous and powerful body of recusants, relying on their merits, and stimulated by their ecclesiastics to the most imprudent excesses." Lord Falkland returned and lived in honour and esteem till 1633, in which year, in the month of September, he died, in consequence of having broken one of his legs by an accident in Theobalds Park. A 'History of the most unfortunate Prince Edward II.,' written by him, was published under the editorship of Sir James Harrington, in folio and octavo, in 1680. Lord Orford ('Royal and Noble Authors,' vol. v., p. 65) says he was remarkable for an invention to prevent his name being counterfeited, by artfully concealing in it the successive years of his age, and by that means, detecting a man who had not observed so nice a particularity.

FALKLAND, LUCIUS CARY, VISCOUNT, was the eldest son of the preceding, and born in 1610. From 1622 till 1629, during which time his father was Lord-Deputy of Ireland, he was educated at Trinity College, Dublin; but afterwards at St. John's College, Cambridge. Before he was of age he inherited an ample fortune from his grandfather, and soon afterwards went over to the Netherlands, with the intention of taking a command, but finding the campaign inactive, he returned to England. He had greatly displeased his father by marrying a lady of small fortune; and though the marriage was a very happy one, troubled by his father's anger, he resolved to retire to the country and devote himself to literary studies. Having conceived a desire to be able to read accurately the Greek authors, he secluded himself at his seat near Burford in Oxfordshire, and prosecuted his design with such vigorous industry that he became a master of the language in an incredibly short time. His house was only about ten miles from Oxford, and Chillingworth and other learned men of the university were at this time in the habit not only of visiting him, but of residing with him. In 1639 he joined the expedition against the Scotch. His peerage, being Scotch, did not entitle him to sit in the House of Lords, and in 1640 he was elected member for Newport, Isle of Wight, in the parliament which assembled on the 13th of April. He was again elected for the same borough in the parliament which met on the 3rd of November in the same year. In the Commons, Lord

Falkland, whilst fully concurring in the proposition for prosecuting the Earl of Strafford, urged strenuously, though without avail, and almost without support, the propriety, as a matter of justice, of appointing a committee to inquire into the earl's conduct, and to frame specific charges, before proceeding to impeach him of high treason.

Lord Falkland was free from any party bias, and thinking that the leaders of the popular party were in certain instances pushing their measures to an extent which was illegal and fraught with danger, and that the king was disposed to acquiesce in the just demands of the nation, he opposed them strenuously: hence he came to be regarded as an advocate of the court, and Charles I. invited him to become one of his privy council, and offered to make him secretary of state in the room of Sir Henry Vane, whom the king had dismissed. Lord Falkland was much disinclined to associate himself with the court party, but after much persuasion by Lord Clarendon and other personal friends, he was prevailed upon to accept the king's offer. His severity of moral principle was ill fitted to harmonise with Charles's duplicity and unconstitutional designs, but the civil war having commenced, he adhered to him with inflexible firmness, using every effort to reconcile the contending powers, and, though without any military command, attending the king on all occasions of conflict or danger. But his alacrity of spirit had deserted him, and when sitting among his friends, after long silence and frequent sighs, he would ejaculate, "Peace, peace," in a mournful tone, and passionately profess that "the very agony of the war, and the view of the calamities and desolation the kingdom did and must endure, took his sleep from him, and would shortly break his heart." He insisted on making one in the first rank of Lord Byron's cavalry at the battle of Newbury, September 20, 1643, and on the first encounter was shot in the belly with a musket-ball; he instantly fell from his horse, and his body was not found till the following day.

Lord Clarendon, who was his intimate friend, has pronounced a long and eloquent eulogium on his character, which indeed appears to have been worthy of the highest admiration. His chief work was, 'A Discourse on the Infallibility of the Church of Rome.'

FALLOPPIO, or FALLOPIUS, GABRIELLO, was born at Modena about 1523. He was one of the three distinguished anatomists of the 16th century to whom Cuvier, an unquestionable authority on such subjects, has assigned the merit of restoring, or rather creating, their science in its modern and exact form. His associates in this award of praise are Vesalius and Eustachius, the former of whom he succeeded in the united professorships of anatomy and surgery at Padua in 1551: the latter taught at Rome during the same period. [EUSTACHIUS.]

Fallopius appears at one time to have held an ecclesiastical appointment in the cathedral at Modena, which he resigned to devote himself to more congenial pursuits. Having gratified his curiosity by travelling through the most interesting parts of Europe, he settled for a time as a public teacher of anatomy at Ferrara, where he had received a medical education. But he soon quitted that university, which was in fact a sphere too narrow for his talents; and had lectured at Pisa for some years with increasing reputation under the patronage of the first Grand Duke of Tuscany [Cosmo I.], when he was induced by the liberal proffers of the Venetian senate to repair to Padua to take the place of Vesalius, who had been obliged to resign his academic offices by one of the disastrous incidents which have thrown a romantic interest over the latter part of his remarkable life. [VESALIUS.]

The studies of Fallopius were by no means confined to one department of natural history. He appears to have occupied himself, among the rest, with the subject of systematic botany, which had very recently begun to attract attention. In this, as in all other steps in the revival of learning, Italy took the lead. The first botanic garden had been established at Pisa by Cosmo de' Medici in 1543, and was at this time under the management of Cessalpinus. The second was established two years later at Padua; and the charge of this garden, with the professorial duties annexed to it, was committed to Fallopius soon after his arrival in that university. The botanical researches and collections he had made during his travels, and his subsequent opportunities at Pisa of access to the best sources of contemporary information, had probably fitted him in no common degree to undertake this additional charge, which he is said to have sustained with great ability and applause.

In addition to his merit as a naturalist and a teacher, Fallopius was an excellent and expeditious operator, and otherwise, for his time, a good practical surgeon. His character with posterity in this respect is however somewhat tainted by the appearance of a degree of quackery in the concealment of his remedies, and a trumpeting forth of their virtues, which his experience of them could not have justified. After a short but brilliant career of eleven years, both in practice and as a teacher, he died at Padua in 1562, and was succeeded by his favourite pupil Fabrizio, or Fabricius ab Acquapendente. [FABRIZIO.]

The only work certainly known to have been revised by himself was a volume entitled 'Anatomical Observations.' It was first printed in 8vo at Venice in the year before his death, and has been frequently reprinted. The publication of this work forms an epoch in the science of human anatomy. There is no part of the frame with which the author does not display a masterly acquaintance. Many important

parts of it he was the first to describe, if not to observe, and several of them still bear his name. His lectures on pharmacy, surgery, and anatomy were published after his death in various forms, and with very different degrees of fidelity, by his pupils. The best of them were collected and published with his 'Observations' in 3 vols. folio, Venice, 1584, and have passed through several editions. They are now superseded by more complete and systematic treatises, and are seldom consulted but by antiquarians in medical literature, or to support novel opinions; for in these sciences, as in others, much that is *new* is likewise old.

FANSHAWE, THE RIGHT HONOURABLE SIR RICHARD, was the youngest son of Sir H. Fanshawe, and was born in 1608 at Ware Park, in the county of Hertford. He became a fellow-commoner of Jesus College, Cambridge, in 1623, and removed to the Inner Temple in 1626. On the death of his mother, who had long survived his father, he betook himself to travel, and visited France and Spain. He was subsequently appointed secretary to the embassy at Madrid, and was left resident there till 1638. After his return, and on the breaking out of the civil war, he declared himself a royalist, and attended the court at Oxford, where he received the degree of Doctor of Civil Law. He followed the Prince of Wales to the islands of Scilly and Jersey in the capacity of secretary, and in 1648 became treasurer to the navy under Prince Rupert. At the battle of Worcester he was taken prisoner; but being released, he repaired to Charles II. at Breda, and was by him appointed his master of requests and Latin secretary. He returned to England with Charles, represented Cambridge in 1661, and was employed in negotiating Charles's marriage with Catherine. He was sent as ambassador to Philip IV. of Spain in 1664, and died at Madrid in 1666, leaving a widow and five children. His body was sent home embalmed.

Notwithstanding the active life of Fanshawe, he found leisure to attend to literature, and produced several works, the most celebrated of which is a translation of Guarini's 'Pastor Fido.' The parts of this work written in heroic measure are harsh and ill-managed, but the lighter lyric passages are playful and often melodious, and some of the more sublime choruses are sonorous and majestic. This book is not very easily procured. It was published in 1664, and is adorned with a curious portrait of Guarini. Besides the 'Pastor Fido' the volume contains some translations from Virgil and Martial; some short original pieces in verse; and a 'Short Discourse of the long Civil Wars of Rome' in prose.

FANT, ERIK MICHAEL, an investigator of the early political and literary history of Sweden, whose labours are of considerable value, was born at Eskilstuna in Sudermanland, on the 9th of January 1754, studied at the university of Upsal, became assistant-librarian there in 1779, and Professor of History in 1781. He retired in 1816 on a pension, which he enjoyed for a very short time, dying at Upsal on the 23rd of October 1817. His life was written by his friend and pupil J. H. Schröder, the present librarian of Upsal, and is included in a small volume published by him in 1839 under the title of 'Tal och Minnestekningar.'

The most important work with which Fant was connected was the collection entitled 'Scriptores rerum Svedicarum mediæ ævi.' He had originally projected it with his friend Nordin when both of them were sub-librarians at Upsal, but the project slept for want of encouragement for forty years, and Bishop Nordin was dead when Fant at the age of sixty-two retired from his professorship with the view of devoting himself to the realisation of their youthful project, and died before the publication of the first volume. That volume was issued in 1818, and a second was published in 1828 by Geijer and Schröder. The work appears to have advanced no further than these two folios, but even in this imperfect state it is an indispensable book in every Swedish library. It contains the only editions of several contemporary histories, bearing on the introduction of the Reformation into the North. A peculiar feature in the literature of Sweden consists in the number and importance of its academical theses or dissertations, which are nearly as various in their subject-matter and in their mode of treatment as the articles of English reviews. The name of Fant is attached to no less than three hundred and twenty-eight of these compositions. Two names appear on the title-page in connection with each thesis—that of the 'Præses,' generally the professor of the branch of knowledge to which it belongs, and that of the 'Respondent,' or candidate for a degree; and by a very unfortunate rule of academical etiquette the reader is generally left in the dark as to whether the Præses or the Respondent is the author of the thesis.

Fant is spoken of by friends at the university acquainted with the facts of the case, as the author of a 'History of Greek Literature in Sweden,' to which his name is appended as Respondent, and of 'Annals of Swedish Typography, in the 16th Century,' to which his name is appended as Præses. Many of the other dissertations, which are said to be of very unequal merit, and with some of which he may have had no other concern than that of lending his name, are on equally curious subjects—miscellaneous Swedish biography, the history of Gustavus Adolphus, the history of the Reformation in Sweden, &c. He published also some more ambitious attempts at a continuation of the history of Sweden, by Lagerbring, as a general outline of Swedish history, &c., but these do not appear to have enhanced his reputation.

FANTUZZI. [TRENTO, ANTONIO DA.]

*FARADAY, MICHAEL, one of the most distinguished living chemists and natural philosophers. He is one of the numerous examples afforded by this country, that the highest genius is not dependent on rank or station, and that, in spite of the almost entire neglect of the cultivation of natural science in our schools and colleges, we can boast of men whose investigations and discoveries are second to none. Mr. Faraday was born in London in 1794, and was the son of a blacksmith. With little preliminary education, he was apprenticed to a bookbinder and stationer named Riebau in Blandford-street. During his apprenticeship he spent his leisure hours in the construction of philosophical apparatus, and more especially an electrifying machine. This was the occasion of his being introduced to Mr. Dance of Manchester-street, then a member of the Royal Institution, who, finding the young man interested in science, obtained permission for him to attend the last four of a course of lectures on chemistry then being delivered by Sir Humphry Davy. The lectures thus attended were not only listened to with delight, but ample notes made and afterwards carefully re-written, and Faraday, as he has related in a letter to Dr. Paris, the biographer of Davy, was led by his strong desire to escape from trade, and the kind-heartedness which he fancied he saw in the lecturer, to take the bold step of writing to Sir H. Davy, expressing his wishes, and a hope that if an opportunity came in his way he would favour his views. At the same time Faraday sent the notes he had taken of the lectures. Sir Humphry Davy replied to the young applicant as follows:—"December 24th, 1812.—Sir,—I am far from displeased with the proof you have given me of your confidence, and which displays great zeal, power of memory, and attention. I am obliged to go out of town, and shall not be settled in town till the end of January. I will then see you at any time you wish. It would gratify me to be of any service to you. I wish it may be in my power.—I am, Sir, your obedient, humble servant, H. DAVY." "Early in 1813," continues Mr. Faraday, "Sir Humphry requested to see me, and told me of the situation of assistant in the laboratory of the Royal Institution, then just vacant. At the same time that he thus gratified my desires as to scientific employment, he still advised me not to give up the prospects I had before me, telling me that science was a harsh mistress, and in a pecuniary point of view but poorly rewarding those who devoted themselves to her service. He smiled at my notion of the superior moral feelings of philosophic men, and said he would leave me to the experience of a few years to set me right on the matter. Finally, through his good efforts, I went to the Royal Institution early in March 1813 as assistant in the laboratory; and in October of the same year went with him abroad as his assistant in experiments and in writing. I returned with him in April 1815, resumed my station in the Royal Institution, and have, as you know, ever since remained there."

Faraday remained for some years at the Royal Institution without publishing anything to attract general attention. Sir H. Davy had the highest opinion of him; and all who knew him at this period regarded him as likely to fill the position of that great chemist in the eyes of the world. One of his earliest works was his volume on chemical manipulation, which was published in 1827, and reached a second edition in 1836. In 1830 he published a paper on the manufacture of glass, and another, in 1831, on acoustical figures. It was, however, in 1831 that he commenced the publication of those experimental investigations on the subject of electricity, in the 'Philosophical Transactions,' that have made his name famous wherever science is cultivated, or the labours of the investigator of natural laws are appreciated. These papers have been almost regularly published (two in the course of the year) from that time to the present; and there is not one of them that does not contain either a discovery of importance, or a criticism, arising out of some original discovery, upon the labours of others. These papers embraced the wide subject of electricity. To ascertain the nature of this force; to evolve the laws which it obeyed; to exhibit the modes of its development, and its relations to heat, light, and the other great forces in nature, were the objects of these papers. If Faraday did not discover the science of electro-magnetism, he established its laws, and made the science of magneto-electricity. If he thought that the phenomena of free electricity, galvanism, and magnetism, were the manifestations of the same force, was not originally his, it has been mainly through his experiments that it has been demonstrated to be true. The science of electricity, comprehending the great facts of voltaic electricity and magnetism, presents multitudes of facts with the widest generalization; and although this science is indebted to a large number of inquirers for its present position, there is one name that shines more brightly than any other through the whole of these researches, and that is Faraday.

All his investigations on the phenomena of electricity have been collected together and published in three volumes, entitled 'Experimental Researches in Electricity.' The first volume was published in 1839, and embraced papers published in the 'Philosophical Transactions,' from 1831 to 1838. These first papers deal with the phenomena of static electricity and the chemical phenomena of voltaic electricity. The second volume was published in 1844, and embraces papers from the 'Philosophical Transactions,' the 'Quarterly Journal of Science,' and the 'Philosophical Magazine,' from 1838 to 1843. It commences with his paper on the electricity of the gymnotus, and with experi-

ments on electro-magnetism and magneto-electricity. The third volume, published in 1855, embraces papers published from 1846 to 1852, in the 'Proceedings of the Royal Institution' and the 'Philosophical Magazine.' This work contains all Faraday's late researches on magnetism, the discovery of dia-magnetism, and the magnetic nature of oxygen gas, the magnetic nature of light, and other important points. These papers are, some of them, the most remarkable examples of inductive inquiry that have been given to the world since the time of Bacon. They deal with forces whose phenomena are exceedingly difficult to investigate, presenting a greater amount of complication than any others in the region of natural science. They present us with instances of the boldest speculation in commencing experiments, combined with the greatest accuracy in conducting them, and the utmost caution in arriving at conclusions. The multitude of experiments by which they are illustrated indicate a life of unvaried assiduity and perseverance in pursuit of the great object of a philosopher's existence—a knowledge of the truth. Amidst the absorbing interests of his own experiments and conclusions, he is ever alive to the labour of others, and everywhere betrays the most scrupulous anxiety to give every one his due share of credit. In no philosophic writings do we see less of the author and more of the subject. His object being to get at the truth, he is never wedded to an opinion or conclusion, but is ever ready to give way to the opinion of another, when this is seen to be based on fact. "In short," to use the language of a recent writer, "intellectually and morally, Faraday is a philosopher of the highest rank, of whom the country has just reason to be proud."

With all these high qualities as an investigator and thinker, Faraday has the most happy power of expression. He is the prince of popular lecturers; and the most popular singers and actors are deserted when Faraday delivers a lecture on Friday evenings, at the Royal Institution. It is here the philosopher is seen in his glory; as absorbed and earnest as a child over his toys, he repeats again his experiments before an admiring audience, none, perhaps, so absorbed in the lecture as he is in the subject of his discourse. His lectures to children are, perhaps, the most perfect expressions of his own genius, and the most complete examples of extemporaneous teaching. Their merit does not however consist alone in the grace and ease of his expression, but in the marvellous facility he possesses of experimenting at the same time that he is talking. This facility in experimenting is evidently the gift of genius, and a part of those admirable natural endowments which have made him the great philosopher he is.

In private life, Mr. Faraday is admired for the simplicity, truthfulness, and kindness of his character. Averse to strife and the gaze of the world, he has refused all offers of place and honour. He has felt that the sphere of his mission lay in the development of those discoveries which were first made in the laboratory of the Royal Institution. This spot witnessed his first triumph, and there he still remains, to win fresh laurels on those fields of science where he has no equal.

FAREY, JOHN, civil engineer and draughtsman, was born at Lambeth on March 20, 1791, and was educated at Woburn, where his father was agent to the Duke of Bedford, who took much interest in the progress of agriculture. John Farey, Senior, was frequently employed in making reports on geological questions; wrote a 'General View of the Agriculture and Minerals of Derbyshire,' &c., (2 vols. 8vo, London, 1811), a work which had some reputation, and contributed to the 'Agricultural Magazine.' Farey, junior—with his brother and sisters, becoming at an early age attached to kindred pursuits—was engaged in making drawings for the plates of 'Rees's Encyclopedia,' 'The Edinburgh Encyclopedia,' 'Tilloch's Magazine,' 'Gregory's Mechanics,' and 'Mechanical Dictionary,' the 'Pantalogia,' and many other publications, some of which he contributed articles to, or edited. To him, in conjunction with the Messrs. Lowry, the engravers, has been ascribed in a great degree, the merit of introducing a better explanatory style of illustration in scientific works, and which has not since been improved upon in the bulk of publications, in a ratio commensurate with mechanical facilities. His avocations connected him with eminent scientific men of the time; and thus with Huddart, Jessop, Mylne, and Rennie, he was engaged in the publication of Smeaton's reports and drawings. In 1807 he had received the silver medal of the Society of Arts for an instrument for making perspective drawings, described in their Transactions; and in 1813 the gold medal was awarded to him on the invention of his machine for drawing ellipses. This last he afterwards improved upon, besides effecting many improvements in the scales and drawing instruments now in use. In 1819 he went to Russia, and was engaged in the construction of iron-works. In Russia he first saw a steam-engine indicator—an instrument which it was attempted to keep secret—and on his return he had similar contrivances manufactured, and was often employed to use them in disputed cases. In 1821 he resigned his professional engagements in favour of his brother, and embarked in a lace manufactory in Devonshire, but gave that up in 1823. In 1825 he took the engineering direction of flax-mills at Leeds; but in 1826, on the failure of his brother's health, he returned to London, and from that time to near his death, which took place in his sixty-first year, on the 17th of July 1861, he was employed as a consulting engineer, or referee, in most of the novel inventions and litigated patent cases, during the quarter

of a century. For such duties he was peculiarly qualified from retentive memory as to details of machines and processes, names and dates, and from habits of conscientious and laborious research into authorities for cases. In his investigations and in the preparation of drawings for specifications, he was assisted by his wife, a lady of great scientific attainments. From the shock of her decease he never wholly recovered. Some time before, part of his library and documents had been burnt with his house in Guildford-street. Farey commenced a 'Treatise on the Steam-engine, Historical, Practical, and Descriptive,' (4to, London, 1827, with plates,) a valuable work, but which did not get beyond a first volume, and he was an active member of the Institution of Civil Engineers, from whose Report of 1851-52 many of these particulars are derived.

FARIA E SOUSA, a Portuguese escudero, and a writer on various subjects, chiefly in the Spanish language, was born in 1590, in a country residence called Caravella, in the province of Entre Minho e Douro. His talents were so precocious, that in 1600 he attended the lectures of his father and others at the University of Braga. Being desirous to become familiar with the Greek and Roman classics, he repaired, in 1604, to the learned Gonçalo de Moraes, bishop of Oporto. This new tutor soon appointed him his secretary, notwithstanding Faria's constant rejection of all offers of preferment on condition of entering the church, and notwithstanding his consecrating the first essays of his muse to his mistress Amelia. This lady was probably the same Donna Catalina Machado whom Faria married in 1614, whose stoical calmness in a tremendous storm at sea he celebrated in his 'Fuente de Aganippe' (Od. ii. part 3). In 1619 Faria quitted Portugal to try his fortune at the Spanish court; but his independent character prevented his success, and he returned to Portugal. Being unable to improve his prospects in Portugal, he once more resorted to Madrid, and at last in 1631 obtained the secretaryship to the Spanish embassy at Rome under the Marquis of Castel Rodrigo. He attracted the notice of the Italian literati, and even numbered Pope Urban VIII. among his patrons, but he could not agree with the marquis, and returned to Spain in 1634. After many sufferings, proceeding from the resentment of this personage, he was allowed at last to settle as a prisoner at Madrid, where, abandoning all thoughts of advancement, he devoted the remainder of his life solely to letters with such ardour as to hasten his death, which took place on the 3rd of June 1649.

Faria adhered closely to that extravagant school which in Spain was fostered so much by that of the Martinists in Italy. He revelled in bold flights of fancy, but all his beauties are like flowers buried in parasitical weeds. He wrote daily, as he says himself, twelve sheets; and moreover had such facility in rhetorical turns and flourishes, that in a single day he could compose a hundred different addresses of congratulation and condolence. On the other hand, his historical works, which are written in Spanish, are still valuable for their subject-matter. The rest of his works are not all in that language, as we find it stated in the 'Biographie Universelle.' Out of his select 600, or, as he terms them, 'six centuries,' of sonnets, exactly 200 are in Portuguese, and twelve of his eclogues are also in that language.

His works are—1st. 'Noches Claras, o Discursos morales y politicos.' 2nd. 'Comentarios sobre la Lusitana,' on which he laboured twenty-five years, and yet the commentary, except on historical points, rather obscures than illustrates the original. It was prohibited first by the Inquisition of Spain, and more strictly afterwards by that of Portugal. This occasioned the following work:—3rd. 'Defensa por los Comentaristas sobre la Lusitana.' 4th. 'Epitome de las Historias Portuguesas,' or a History of Portugal. 5th. 'Imperio de la China, y Cultura Evangelica por los Religiosos de la Compania de Jesus,' written by Samedo, but published by Faria. The following are his posthumous works:—'El Asia Portuguesa desde 1497 hasta 1640'; 'La Europa Portuguesa hasta 1557'; 'El Africa Portuguesa,' translated by John Stevens, 3 vols. 8vo, London, 1796; 'El America Portuguesa,' inedited; 'Fuente de Aganippe, o Rimas varias'; 'Divinas y humanas Flores'; 'Gran Justicia de Aragon'; at the end of which is the 'Retrato de Manuel Faria,' that is to say, his Life, by his friend Porcel. Besides this work the reader may consult Bouterwek, 'Spanish and Portuguese Literature'; Nicholas Antonius, 'Biblio. Hisp.'; Nicéron, 'Mémoires,' &c., vol. xxxvi.

FARINATI, PAOLO, a celebrated painter of Verona, where he was born in 1522. He studied first under Niccolò Giolfinò, at Verona, and afterwards under Giorgione and Titian at Venice. There are several excellent works in fresco and in oil by him in the principal cities about Verona, where he and his wife died, in 1606, on the same day. His style of design is robust and vigorous, similar to that of Julio Romano, and his colouring has much of the character of that of the Venetian school. He etched a few designs from sacred and mythological history: they are described by Bartsch.

FARMER, DR. RICHARD, descended from a respectable family in Leicestershire, was born at Leicester, August 28, 1735. He received the early part of his education in the Free Grammar School of his native town, and in 1753 was entered a pensioner of Emmanuel College, Cambridge. In due time he took his degrees; was elected fellow, and in 1760 became classical tutor of Emmanuel College, which office he held until his election to the mastership in 1776. He served the office of Vice-Chancellor in the same year, and in 1778 was elected Chief Librarian to the University. In 1780 he was collated

to a prebendal stall at Lichfield, and some time afterwards became Prebendary of Canterbury, which he resigned (1788) for the office of a Canon Residentiary at St. Paul's. He died after a long and painful illness, at Emmanuel Lodge, September 8, 1797, and was buried in the chapel. An epitaph to his memory was written by Dr. Parr, and is inscribed on the college cloisters. Dr. Farmer collected a valuable library of tracts and early English literature, which was sold after his death and produced, as it is said, a great deal more than it originally cost.

Dr. Farmer was a tory in politics, and belonged to the party which goes by the name of 'orthodox,' in the church; his manners were frank and unreserved, and his habits rather those of a boon companion than of a clergyman. It is reported of him that he declined a bishopric rather than forego his favourite amusement of seeing Shakspeare performed on the stage, a reason which, if founded on truth, had at all events more cogency in the time of Garrick than at present. Dr. Farmer is now only remembered by his 'Essay on the Learning of Shakspeare,' a work which, on its first appearance, was described as learned, ingenious, and laborious. It deserves this character, but no more. It contains the result of much reading, but is distinguished by neither taste nor judgment.

FARNABY, or FARNABIE, THOMAS, a learned critic and grammarian, was born in London in 1575. His grandfather was of Truro in Cornwall; but his great-grandfather, an Italian musician, was the first of his family who settled in England. He was admitted as a servitor of Merton College, Oxford, in 1590; but being of an unsettled disposition, he quitted the university abruptly, changed his religion, and passed over to Spain, where he was received into a Jesuits' college. But he soon grew weary of their discipline; and in 1595 joined Sir Francis Drake and Sir John Hawkins in their last expedition. He is reported also to have served subsequently as a soldier in the Low Countries. Gaining no profit in these expeditions, he returned to England, landed in Cornwall, and in the urgency of his necessities descended to the humble employment of teaching children their horn-book. In this situation he assumed the name of Thomas Bainrafe, the anagram of Farnabie. After some time he changed his residence to Martock in Somersetshire, where he established a grammar-school for youth with great success, under his own name. From Martock he removed to London, and opened a school in Goldsmiths' Rents behind Red-cross-street, near Cripplegate, where his reputation became so established, that the number of his scholars, chiefly the sons of noblemen and gentlemen, amounted at one time to more than 300. Antony à Wood says, his school was so frequented that more churchmen and statesmen issued from it than from any school taught by one man in England. Whilst here he was created M.A. in the University of Cambridge, and on the 24th of April 1616 was incorporated in the same degree at Oxford. In 1636 he quitted London to reside at Sevenoaks in Kent, resuming his former occupation, and, with the wealth which he had accumulated, purchased landed property both in Kent and Sussex. In 1641 he became mixed up in the commotions of the times as a favourer of the royal cause, and was committed to prison, first in Newgate, and afterwards in Ely House. It was at one time debated in the House of Commons whether he should not be transported to America. Wood insinuates that some of the members of both Houses who had been his scholars were among those who urged his being treated with severity. He died on the 12th of June 1647, and was interred in the chancel of the church at Sevenoaks.

His own works were—1, 'Index Rhetoricus Scholis accommodatus,' 12mo, Lond., 1625: to which in 1646 were added 'Formule Oratorie et Index Poeticus'; the fifth edition was printed in 1654; 2, 'Florilegium Epigrammatum Græcorum, eorumque Latino versu à variis redditorum,' 8vo, Lond., 1629, 1650; 3, 'Systema Grammaticum,' 8vo, Lond., 1641; 4, 'Phrassologia Anglo-Latina,' 8vo, Lond.; 5, 'Tabulæ Lingue Græcæ,' 4to, Lond.; 6, 'Syntaxis,' 8vo, Lond. His editions of the classics, with annotations, were, Juvenal and Persius, 12mo, Lond., 1612; Amst., 1662; Hag., 1663; Seneca, 12mo, Lond., 1613; Amst., 1632, 1634; 8vo, Pat., 1659; 12mo, Amst., 1665; Martial, 12mo, Lond., 1616; Gen., 1623; Lond., 1633; Lucan, 12mo, Lond., 1618; 8vo, Francof., 1624; Virgil, 8vo, Lond., 1634; Ovid, fol., Par., 1637; 12mo, Lond., 1677, &c. His 'Notes upon Terence' were finished only as far as the fourth comedy when he died; but Dr. Merio Casaubon completed the last two comedies, and published the whole at London, 12mo, 1651. Other editions were 8vo, 1669; and Salm, 1671. Dr. Bliss, in his additions to Wood's 'Athenæ,' says, 'Farnaby intended an edition of Petronius Arbitr's 'Satyricon.''

FARNÉSE, the name of a noble family of modern Rome, who were originally feudatories of the territory of Farnese and Montalto, in the Papal States, south-west of the Lake of Bolsena, and near the borders of Tuscany. The splendour of this family was greatly increased by the exaltation of Cardinal Alessandro Farnese to the Papal See after the demise of Clement VII. in October 1534. [PAUL III.] This pope had a natural son, Pier Luigi Farnese, whom he determined to make a sovereign prince. For this purpose he first of all alienated part of the territory of the church in the neighbourhood of the feudal domain of his family, and formed a duchy called that of Castro, from the name of its chief town, adding to it the towns of Ronciglione and Nepi, with their territories. This district,

which comprised nearly one-half of the province called Patrimonio di San Pietro, he bestowed on Pier Luigi and his descendants, with the title of Duke of Castro, as a great fief of the Holy See. He also obtained for him from Charles V. the investiture of the Marquisate of Novara as an imperial fief, and from the Venetian Senate permission to be inscribed on the golden book of the patricians of Venice, an honour considered as equal, if not superior, to that of a feudal title. The pope also made his son Gonfaloniere, or Captain General of the Holy See, an office which Pier Luigi dishonoured by the most depraved conduct. Lastly, Paul III. in 1545 gave his son the investiture of Parma and Piacenza, which Pope Julius II. had conquered, with the title of sovereign duke of those states, on condition that the duke and his successors should pay an annual sum of 8000 ducats to the Roman See. The emperor Charles V. however, who, as Duke of Milan, had claims on Parma and Piacenza, would not bestow the investiture upon Pier Luigi. The new Duke of Parma and Piacenza soon became hateful to his subjects for his vices and oppression, and a conspiracy was formed by Count Anguissola and other noblemen, secretly countenanced by Don Ferrante Gonzaga, imperial governor of Milan, who hated Pier Luigi. On the morning of the 10th of September 1547, Anguissola stabbed the duke while at dinner in the ducal palace of Piacenza, and threw his body out of the window, when it was mutilated and dragged about by the mob. Piacenza was taken possession of by the imperial troops, but Parma remained in possession of Ottavio Farnese, son of the murdered duke. In 1556, Philip II., as sovereign of the Milanese, restored Piacenza to the Duke Ottavio, but the citadel continued to be garrisoned by Spanish soldiers. Ottavio dying in 1587, was succeeded as Duke of Parma and Piacenza by his son Alessandro Farnese, who distinguished himself as general of the Spanish armies in the wars against France. He was made governor of the Spanish Netherlands by Philip II., and carried on the war against the Prince of Orange. He is known in history by the name of the Duke of Parma. Alessandro died in 1592, and was succeeded by Ranuccio Farnese, a suspicious and cruel prince. A conspiracy was hatched against him at Rome, but it being discovered, a number of people were put to death in 1612. His successor, Odoardo Farnese, quarrelled with Pope Urban VIII. about the Duchy of Castro, which that pope wished to take away from him to give it to his own nephews, the Barberini. This gave rise to an absurd and tedious warfare between the papal troops and those of Parma. Ultimately, through the mediation of other princes, the Farnese were left in possession of Castro, but under the following pontificate of Innocent X. they were finally deprived of that territory in 1650, and the pope razed the town of Castro to the ground, under the pretence of its bishop having been murdered by some assassins. This occurred under Ranuccio II., Farnese, duke of Parma, who had succeeded Odoardo. The Farnese continued to rule over Parma and Piacenza till 1731, when the last duke, Antonio Farnese, having died without issue, the male line of the Farnese became extinct. But Elizabeth Farnese, wife of Philip V. of Spain, claiming the duchy for her children, it was ultimately given, by the peace of Aix-la-Chapelle, to her younger son Don Filippo. The other fiefs however, and the personal property of the Farnese, including the rich museum and the splendid palace at Rome, were given to his brother, Don Carlos, king of the two Sicilies, and some of the finest statues and paintings in the museum of Naples are derived from that inheritance. The Farnese palace at Rome, which belongs to the King of Naples, is considered the finest among the numerous palaces of that city. The Farnesina or smaller mansion on the opposite or right bank of the Tiber is known for the beautiful frescoes of Raffaele. The Orti Farnesiani occupy a great part of the Palatine, and include some remains of the palace of the Cæsars.

Among the various families which have owed their aggrandisement entirely to a papal ancestor, the Farnese attained the highest rank among Italian princes, and retained it the longest. It has produced several cardinals, distinguished for their learning.

(Ciacconius, *Vita et Gesta summorum Pontificum et Cardinalium*; Moreri, *Dictionary*, article 'Farnese'; Affo, *Vita di Pier Luigi Farnese*, and the Italian historians of the 16th century.)

FARQUHAR, GEORGE, was born at Londonderry in 1678, and received his education at the University of Dublin. Though he displayed talents at an early age he did not take any degree, but forsook his severer studies for the stage, and appeared at the Dublin theatre. He never however made any great figure as an actor, and having had the misfortune to wound a brother comedian with a real sword, which he mistook for a foil, he forsook the stage, being at that time only seventeen years of age. He accompanied the actor Wilks to London, and attracted the notice of the Earl of Orrery, who gave him a commission in his own regiment, which was then in Ireland.

Wilks exhorted him to try his powers as a dramatist. Accordingly in 1696 he produced his comedy of 'Love and a Bottle,' which was so successful as to encourage him to another effort. His 'Constant Couple,' which appeared two years afterwards, was played fifty-three nights in the first season, and was the cause of the favourable reception of a very indifferent sequel which he wrote under the title of 'Sir Harry Wildair.' In 1703 he produced a version of Beaumont and Fletcher's 'Wild-goose Chase,' under the name of the 'Incon-

stant,' which long continued to be occasionally played at the London theatres. He was married in the same year, and getting into great difficulties was forced to sell his commission; other mortifications and disappointments ensued, and he became so deeply affected that he fell into a decline, and died in 1707. During his last illness he wrote his celebrated 'Beaux Stratagem.'

The appearance of Farquhar's comedies may be regarded as an important epoch in the history of the English drama. He was the first of his period to write in an easy flowing style, equally removed from the pedantic stiffness of Congreve and the formal viciousness of the Etherege school, and he also attended more to character than most writers of the day. Immoral and licentious as his plays may appear to readers of the present day, those who are conversant with writings of that time must acknowledge them to be considerably more pure than those of his contemporaries, if we except his first piece 'Love and a Bottle.' It is singular enough that the critics regarded as Farquhar's chef d'œuvre a serious comedy called the 'Twin Rivals,' which has now sunk entirely into oblivion, or at best is only remembered by readers of the old English drama as containing a masterly though disgusting portrait under the name of 'Mother Midnight.' A neat edition of his works was published in 1736.

FARRANT, RICHARD, one of the fathers of English church music, was born in the early part of the 16th century. He was a gentleman of the chapel-royal in 1564, and subsequently organist and master of the choristers of St. George's chapel, Windsor. He is supposed to have died about 1585. So long as solemn harmony of the purest and finest kind shall find admirers, so long will his service in G minor, and more especially his two anthems, "Hide not thou thy face," and "Call to remembrance," be productive of the most delightful emotions that can arise out of a love of art combined with religious feeling.

FATIMIDES, the name of a race of kings, who assumed the title of kalifs, and reigned for many years over the north of Africa and Egypt. They obtained the name from the pretensions of the founder of the dynasty, Abu Mohammed Obeidallah, who asserted that he was descended from Fatima, the daughter of Mohammed and wife of Ali. The Arabic historians however generally deny the truth of this assertion; and many of them say that his grandfather was a Jew or of the Magian religion. The princes of this family were also called the Aliades, in consequence of their descent, real or pretended, from Ali.

1. OBEIDALLAH, the first Fatimide kalif, was born A.D. 892. Having incurred the displeasure of Moktafi, the reigning Abasside kalif, he was obliged to wander through various parts of Africa, till through fortunate circumstances he was raised in 910 from a dungeon in Segelmessa to sovereign power. He assumed the title of Mahadi, or "director of the faithful," according to a prophecy of Mohammed's that in the space of 300 years such an individual would arise in the west. He subdued the princes in the north of Africa, who had become independent of the Abassides, and established his authority from the Atlantic to the borders of Egypt. He founded Mahadi on the site of the ancient Aphrodisium, a town on the coast of Africa, about a hundred miles south of Tunis, and made it his capital. He became the author of a great schism among the Mohammedans by disowning the authority of the Abassides, and assuming the title of Emir al Mûmenin, "prince of the faithful," which belonged exclusively to the kalifs. His fleets ravaged the coasts of Italy and Sicily, and his armies frequently invaded Egypt, but without any permanent success.

2. CAIEM succeeded his father in 933. During his reign an impostor, Abu Yezid, originally an Ethiopian slave, advanced certain peculiar doctrines in religion, which he was enabled to propagate over the whole of the north of Africa, and was so successful in his military expeditions as to deprive Caiem of all his dominions, and confine him to his capital, Mahadi, which he was besieging when Caiem died.

3. MANSOUR succeeded his father in 946, when the kingdom was in a state of the greatest confusion. By his valour and prudence he regained the greater part of the dominions of his grandfather Obeidallah, defeated the usurper Yezid, and laid the foundation of that power which enabled his son Moez to conquer Egypt.

4. MOEZ (955) was the most powerful of the Fatimide kalifs. He was successful in a naval war with Spain, and took the island of Sicily; but his most celebrated conquest was that of Egypt, which was subdued by his lieutenant in 972. Two years afterwards he removed his court to Egypt, and founded Cairo. The name of the Abasside kalif was omitted in the public prayers, and his own substituted in its place; from which time the great schism of the Fatimide and Abasside kalifs is more frequently dated than from the assumption of the title by Obeidallah. The armies of Moez conquered the whole of Palestine and Syria as far as Damascus. His virtues are highly extolled by the Arabic historians.

5. AZIZ (978). The dominions recently acquired by Moez were secured to the Fatimide kalifs by the wise government of his son Aziz, who took several towns in Syria. He married a Christian woman, whose brothers he made patriarchs of Alexandria and Jerusalem.

6. HAKEM was only eleven years of age when he succeeded his father in 996. He is distinguished even among oriental despots by his cruelty and folly. His tyranny caused frequent insurrections in Cairo. He persecuted the Jews and Christians, and burnt their

places of worship. By his order the church of the Resurrection at Jerusalem was destroyed (1009). His persecutions of the Christians induced them to appeal to their brethren in the West, and was one of the causes that led to the crusades. He carried his folly so far as to seek to become the founder of a new religion, and to assert that he was the express image of God. He was assassinated in 1021, and was succeeded by his son.

7. **DHAHER.** He was not so cruel as his father, but was addicted to pleasure, and resigned all the cares of government to his vizirs. In his reign the power of the Fatimide kalifs began to decline. They possessed nothing but the external show of royalty: secluded in the harem, they were the slaves of their vizirs, whom they could not remove, and dared not disobey. In addition to the evils of misgovernment, Egypt was afflicted in the reign of Dhaheer with one of the most dreadful famines that ever visited the country.

8. **MOSTANSEER** (1037) was only nine years old when he succeeded his father. The Turks invaded Syria and Palestine in his reign, took Damascus and Jerusalem (1076), where the princes of the house of Ortok, a Turkish family, established an independent kingdom. They advanced to the Nile with the intention of conquering Egypt, but were repulsed.

9. **MOSTALI** (1094), the second son of Mostanser, was seated on the throne by the all-powerful vizir Afdhal, in whose hands the entire power rested during the whole of Mostali's reign. The invasion of Asia Minor by the crusaders in 1097 appeared to Afdhal a favourable opportunity for the recovery of Jerusalem. Refusing to assist the Turks against the crusaders, he marched against Jerusalem, took it (1098), and deprived the Ortok princes of the sovereignty which they had exercised for twenty years. His possession of Jerusalem was however of very short duration, for it was taken in the following year (1099) by the crusaders. Anxious to recover his loss, he led an immense army in the same year against Jerusalem, but was entirely defeated by the crusaders near Ascalon.

10-13. The reigns of **AMEER** (1101-29), **HAFEDH** (1129-49), **DHAHER** (1149-54), **FAIKER** (1154-60), contain nothing worthy of notice. During their reigns the power of the Fatimides rapidly decayed.

14. **ADHED** (1160) was the last kalif of the Fatimide dynasty. At the commencement of his reign Egypt was divided into two factions, the respective chiefs of which, Dargham and Shawer, disputed for the dignity of vizir. Shawer implored the assistance of Noor-ed-deen, or Nouredin, who sent an army into Egypt under the command of Shiracouh, by means of which his rival was crushed. But becoming jealous of Noor-ed-deen's power in Egypt, he solicited the aid of Amauri, king of Jerusalem, who marched into Egypt and expelled Shiracouh from the country. Noor-ed-deen soon sent another army into Egypt under the same commander, who was accompanied by his nephew, the celebrated Saladin. [SALADIN.] Shiracouh was again unsuccessful, and was obliged to retreat. The ambition of Amauri afforded shortly afterwards a more favourable opportunity for the reduction of Egypt. Amauri, after driving Shiracouh out of the country, meditated the design of reducing it to his own authority. Shawer, alarmed at the success of Amauri, entreated the assistance of Noor-ed-deen, who sent Shiracouh for the third time at the head of a numerous army. He repulsed the Christians, and afterwards put the treacherous vizir to death. Shiracouh succeeded to his dignity, but dying shortly after, Saladin obtained the post of vizir. As Noor-ed-deen was attached to the interests of the Abassides, he gave orders for the proclamation of Mosthadi, the Abasside kalif (1171), and for depriving the Fatimides of the kalifate. Adhed, who was then on a sick-bed, died a few days after, ignorant, as it is said, of his loss.

FAUCHER, LÉON, an ex-minister of the French government, and a writer on subjects of political economy and social progress, was occupied during the greater part of his life as a journalist. His connection with the periodical press of Paris commenced about the year 1830; and from 1836 to 1843 he was a contributor to the '*Courrier Français*,' and was afterwards a leading writer in the '*Revue des Deux Mondes*,' which is published on the 1st and 15th of every month, and occupies an influential place among those periodicals which are chiefly devoted to the discussion of questions of political economy and the investigation of the actual condition of the various nations of the world. M. Léon Faucher was, during the last ten years of the dynasty of Louis Philippe, a member of the Chamber of Deputies for the department of Marne. He was re-elected by the same department in 1848 as one of its representatives in the National Assembly of the French Republic. He became Minister of the Interior, December 29, 1848, and held the office till May 14, 1849. He was again appointed Minister of the Interior, April 10, 1851, and was succeeded by the Comte de Persigny, January 22, 1852. M. Léon Faucher died on the 15th of December 1854, at Marseille.

M. Léon Faucher published in 1845 '*Études sur l'Angleterre*,' 2 vols. 8vo, Paris, a work descriptive of the social and industrial condition of certain districts of England—Whitechapel, St. Giles's, the City; Liverpool, Manchester, Leeds, Birmingham, and adjoining districts—together with dissertations on the Bank of England,

the Lower Classes, Middle Classes, Aristocracy, the Corn-Laws and the League, and the Balance of Powers. Several portions of this work had appeared in 1843 and 1844 in the '*Revue des Deux Mondes*,' and the description of Manchester had been translated into English under the title of '*Manchester in 1841; its Present Condition*,' 12mo. The work is written in a fair and impartial spirit, and affords evidence of diligent research and patient investigation; but contains many mistaken views and exaggerated descriptions. Other dissertations by M. Léon Faucher are the following:—'*De l'impôt sur le Revenu*;' '*Du Système de M. Louis Blanc*;' '*De la Situation Financière et du Budget*,' 8vo, 1850, appeared originally in the '*Revue des Deux Mondes*,' in 1849. '*Remarks on the Production of the Precious Metals and the Demonetization of Gold in several Countries in Europe*, by Mons. Léon Faucher; translated by Thomas Hanley, Junior,' 8vo, Lond., 1852. These remarks appeared first in the '*Revue des Deux Mondes*,' and were subsequently published, somewhat modified, in the Reports of the Académie des Sciences Morales et Politiques.

FAUSTINA, ANNIA, was the daughter of Annus Verus, prefect of Rome; she married Antoninus before his adoption by Hadrian, and died in the third year of her husband's reign, thirty-six years of age. She left only one surviving child, named Faustina. The historians have represented her conduct as very licentious. [ANTONINUS PIUS.]

Coin of Faustina the Elder.

British Museum. Actual size. Copper. Weight 346½ grains.

FAUSTINA the Younger, daughter of the preceding, married her cousin Marcus Aurelius, and died A.D. 176 in a village of Cappadocia at the foot of Mount Taurus, on her husband's return from Syria. She is represented by Dion and Capitolinus as even more profligate in her conduct than her mother, and yet Marcus in his '*Meditations*' (l. 17) extols her obedience, simplicity, and affection. Her daughter Lucilla married Lucius Verus, whom Marcus Aurelius associated with him in the empire, and her son Commodus succeeded his father as emperor. [AURELIUS, MARCUS.]

Coin of Faustina the Younger.

British Museum. Actual size. Copper. Weight 395½ grains.

FAWKES, GUIDO or GUY. During the latter years of the reign of Queen Elizabeth the Protestants, who, since the death of Mary, had so increased in numbers and in power as to have acquired the undisputed ascendancy in the government of the kingdom, endeavoured, by the severity of laws enacted against Roman Catholics, to extirpate that religion from England. "Not only were the Catholics forbidden to use the rites and ceremonies of their own faith, but were required to attend upon the services of a church which, if conscientious and consistent, they were bound to abhor. If they refused or forbore to come to a Protestant church on the Sabbath, they were liable to a penalty of 20*l.* for every lunar month during which they absented themselves." Every priest who said mass, and every person who heard it, was liable to a fine of 100 marks, and imprisonment for a year. The ministers of their religion, without whose presence they were precluded from the exercise of the sacraments and other rites, were in effect proscribed and banished; for by a statute passed in 1585 it was enacted that all Jesuits, seminary and other priests, ordained since the beginning of the queen's reign, should depart out of the realm within forty days after the end of that session of parliament, and that all such priests or other religious persons ordained since the same time should not come into England or remain there under the pain of suffering death as in case of treason. It was also enacted by the same statute that all persons receiving or assisting such priests should be guilty of a capital felony. It may be truly said that

these and other rigorous statutes were not at all times enforced; but they placed the whole body of the Roman Catholics at the mercy of the Protestant government; for them therefore there was no liberty, personal or religious, but such as the privy council thought proper to allow; and with reference to their religion, the law gave them no rights, and afforded them no protection.

The facts that James I., although himself a Protestant, was born of Roman Catholic parents, had been baptised by a Roman Catholic archbishop, and approved of several of the ordinances of the Roman Church, gave to the Roman Catholics at his accession hopes of a revival of their liberties. At first, indeed, it appeared that their wishes would be realised, and the severity used towards them relaxed; for the fines paid by the recusants, which in the last year of Elizabeth had amounted to 10,338*l.*, in the first year of James's reign scarcely exceeded 300*l.*, and in the second they were little more than 200*l.* James however was no sooner firmly seated upon the throne, than he overthrew all their expectations. In February 1604 he assured his council that "he had never any intention of granting toleration to the Catholics," that he would fortify the laws against them, and cause them to be put into execution to the utmost. This occasioned among the Roman Catholic party much discontent with the government, the king, and the Protestants in general. The design of blowing up the House of Lords with gunpowder at the opening of parliament, and thus destroying at a single blow the King, the Lords, and the Commons, was formed about the summer of 1604. The conceiver of this desperate and bloody vengeance was Robert Catesby, a Roman Catholic, the son of Sir William Catesby, who had been several times imprisoned for recusancy. Catesby disclosed his scheme to John Wright and Thomas Winter, the former descended from a respectable family in Yorkshire—the Wrights of Plowland in Holderness; the latter from the Winters of Huddington in Worcestershire, where they had been in possession of estates since the time of Henry VI. At a conversation held between these conspirators it was agreed that Winter should go over to the Netherlands to meet Velasco, constable of Castile, who had arrived at Flanders on his way to England to conclude a peace between James and the king of Spain, and request him to solicit his majesty to recal the penal laws against the Roman Catholics, and to admit them into the rank of his other subjects. Winter received no encouragement from Velasco that he would stipulate in the treaty of peace for the liberties of the English Roman Catholics, and so returned to England, having in company Guido Fawkes, who, it was thought, would be of assistance in the business. Fawkes was a gentleman of good parentage and respectable family in Yorkshire; his father, Edward Fawkes, was a notary at York, and held the office of registrar and advocate of the Consistory Court of the Cathedral. Of his education and early history nothing is known; but having spent the little property that he derived from his father, he enlisted in the Spanish army in Flanders, and was present at the taking of Calais by the Archduke Albert in 1598. Soon after Winter's return to London, Thomas Percy, the relation and confidential steward of the Earl of Northumberland, joined the four conspirators already mentioned, and the following oath of secrecy was administered to each, kneeling, with his hands placed upon the Primer:—"You swear by the blessed Trinity, and by the sacrament you now propose to receive, never to disclose, directly or indirectly, by word or circumstance, the matter that shall be proposed to you to keep secret, nor desist from the execution thereof until the rest shall give you leave." They then heard mass, and received the sacrament from Father Gerard in confirmation of their vow. Percy took the next step. He was a gentleman-pensioner, and upon pretence that it would be convenient to him when in attendance in that capacity, he purchased of one Ferris the remainder of a short term which he had in the lease of a house adjoining the parliament-house. Fawkes, who was unknown in London, and had assumed the name of Johnson, acted as Percy's servant, and took possession of the house. Parliament was soon afterwards adjourned till the 7th of February, and the conspirators having first hired a house in Lambeth for the preparation of timber for the mine and a place of deposit for combustibles, agreed to meet in London about the beginning of November. The custody of the house in Lambeth was committed to Robert Keyes, the son of a Protestant clergyman in Derbyshire, but himself a Roman Catholic; the oath of secrecy was administered to him also. The proceedings of the star-chamber during the interval of their meetings so exasperated the conspirators that they became more eager than ever about the plot. Catesby and his confederates, according to a previous agreement, assembled in the house about the 11th of December, and a mine was immediately commenced. The stone wall however which separated them from the parliament-house being found three yards in thickness, Keyes and the younger brother of John Wright (who was enlisted as the others had been) were called in to assist, and the seven men were thus occupied until Christmas-Eve without their ever appearing in the upper part of the house. During their laborious employment they had much consultation respecting the scheme to be adopted. It was supposed that Prince Henry would accompany the king to the parliament-house, and perish there with his father. The Duke of York (afterwards Charles I.) would then be the next heir, and Percy undertook to secure his person, and carry him off in safety as soon as the fatal blow was struck. If this scheme should fail, the Princess Elizabeth was to be surprised and secured by

a party provided in the country. It was the intention to proclaim one of the royal family as king. It was also arranged that Warwickshire should be the general rendezvous, and that supplies of horses and armour should be sent to the houses of several of the conspirators in that county, to be used as occasion might require.

In the midst of these deliberations Fawkes brought intelligence that the parliament had again been prorogued from the 7th of February to the 3rd of October following. The conspirators therefore separated for a time; and in the meanwhile John Grant of Norbrook, in Warwickshire, and Robert Winter of Huddington, were sworn in among their number. In February (1604-5) their labours were resumed, and the stone wall nearly half broken through. One morning while working upon the wall, they suddenly heard a rushing noise in a cellar nearly above their heads. At first they feared they had been discovered; but Fawkes being despatched to reconnoitre, found that one Bright, to whom the cellar belonged, was selling off his coals in order to remove. Fawkes carefully surveyed this large vault situated immediately below the House of Lords, and perceived its fitness for their purpose. The difficulties connected with breaking through the wall, its thickness, the damp of the situation, for water was continually oozing through the stone-work, and the danger of discovery from noise, disposed the confederates to abandon their operations, and to possess themselves of the cellar of Bright. The vault was immediately hired, and about twenty barrels of powder were carried by night from Lambeth: iron bars and other tools that had been used in mining were also thrown among the powder, that the breach might be the greater, and the whole was covered over with faggots. Lumber of various kinds was placed in the cellar to prevent any suspicion of the curious or the watchful. In May 1605 the preparations were complete: the conspirators having marked the door, in order that it might be seen if any one entered the vault, consented to separate; before their separation however it was proposed that an attempt should be made to obtain foreign co-operation by informing Sir William Stanley and Owen of the project. This was agreed to on condition of their being sworn to secrecy, and Fawkes was despatched to Flanders for the purpose of conferring with them. Sir Edmund Baynham was also sent on a mission to the pope, that when the news of the explosion arrived at Rome he might be prepared to negotiate on behalf of the conspirators, and to explain that the design of the plot was the re-establishment of Roman Catholicism. Soon after Fawkes's return from Flanders the parliament was further prorogued from October to the 5th of November. These repeated prorogations alarmed the conspirators, and led them to fear that their project was suspected. Their alarms however having been discovered to be groundless, Catesby purchased horses, arms, and powder, and under the pretence of making levies for the Archduke of Flanders, assembled friends who might be armed in the country when the first blow was struck. As considerable sums of money were necessary for these purposes, it was proposed to admit into the confederacy three wealthy men, Sir Everard Digby [DIGBY], Ambrose Rookwood of Coldham Hall, in Suffolk, and Francis Tresham, the son of Sir Thomas Tresham of Rushton, in Northamptonshire. These gentlemen were afterwards sworn in.

As the day of meeting of parliament approached, it was finally determined that Fawkes should fire the mine with a slow match, which would allow him a quarter of an hour to escape. Sir Everard Digby was to assemble a number of Roman Catholic gentlemen in Warwickshire on the 5th of November under pretence of a hunting party, and Percy was to seize the Prince of Wales, or the Duke of York if the prince should go to the parliament-house with the king. One subject of discussion only arose, whether and how the Roman Catholic peers should be warned of their danger. Each conspirator had friends, if not relations among them; but the danger of communicating the project to so large a number of persons was considered so imminent that they despaired of saving all of them, and it was concluded that no express notice should be given them, but only such persuasion, upon general grounds, as might deter them from attending. Many of the conspirators were averse to this advice and angry at its adoption; and Tresham in particular, for his sisters had married Lords Stourton and Mounteagle. Indeed Tresham so passionately required that Lord Mounteagle should have warning of his danger, that very high words ensued; and when he was thwarted in his wishes, he hinted that the money he had promised would not be forthcoming; and from this time he ceased to attend their councils.

On Saturday the 26th of October, ten days before the meeting of parliament, Lord Mounteagle unexpectedly gave a supper in a house which he had not lately occupied. Circumstances have given rise to a belief that he was privy to the plot at the time that he invited his friends, and that the supper was only given as a convenient opportunity of discovering the conspiracy to them. Be this as it may, whilst he was at table a letter was brought to him by one of his pages, who stated that he had received it in the street from a stranger, who pressed its instant delivery into his master's hands. The letter ran thus:—"My lord out of the love I beare to some of your frends have a caer of your preseruation therfor I would advyse youe as youe tender your lyf to devyse some excuse to shiff of your attendance at this parlement for God and man hathe concurred to punishe the wickednes of this time, and thinke not slightlye of this advertisement

but retyre youre self into youre contri wheare yowe may expect the event in safte for thowghe theare be no apparance of anni stir yet i saye they shall receyve a terrible blowe this parliament and yet they shall not seie who hurts them, this councel is not to be contemned because it may do yowe good and can do yowe no harme for the dangere is passed as soon as yowe have burnt the letter, and i hope God will give yowe the grace to mak good use of it to whose holy protection i commend yowe." "To the right honorable the Lord Mounteagle." This letter has been ascribed to Anne, the daughter of Lord Vaux, to Miss Abington, Lord Mounteagle's sister, to Percy, and to others; but there seem greater reasons for believing that no one of these was the writer of it, but rather that Tresham was its author. It is a point however we have not room to discuss, and therefore must refer the inquiring reader to 'Criminal Trials' (vol. ii. p. 66) for further remarks upon it.

On the same evening Lord Mounteagle showed the letter to several lords of the council, who with him agreed that no steps should be taken until the king returned from hunting at Royston. The contents of the letter and its communication to many of the council, as well as to the secretary of state, soon reached the ears of the conspirators; but though their danger was evident, and the vessel which was to convey Fawkes to Flanders was lying in the river, they made no attempt to escape. All suspected Tresham to be their betrayer, and he was accused by them, but he vehemently denied the accusation. Since they did not know accurately to what extent their proceedings had been divulged, they had still hope of effecting their design, especially as, upon examination, Fawkes found that the cellar was not watched, and had not been disturbed. When however they heard that on the 31st of October the letter had been shown to the king, their hope diminished and their fears increased. Some of the conspirators left London; others concealed themselves in an obscure lodging; all held themselves ready to start at a moment's warning. Fawkes alone, with the extraordinary courage which he had displayed throughout the transaction, took up his station in the cellar. Thus they passed three days of anxiety and suspense. On Monday the chamberlain, with Lord Mounteagle, commenced the search, which appears to have been somewhat strangely delayed. Their suspicions were excited both at finding that Percy was the occupier of a house of which he was known to make no use, and at the unaccountably large store of fuel which filled the cellars, and by the side of which a tall dark suspicious-looking man (Fawkes) was standing. They therefore gave orders to Sir Thomas Knevet, a magistrate in Westminster, to search the houses, the cellars, and the whole neighbourhood. The search was commenced, and about twelve o'clock on the night of the 4th, Fawkes was seized as he came out of the cellar: matches and touchwood were found upon his person, a dark lantern with a lighted candle stood behind the cellar door, and under the faggots thirty-six casks of gunpowder. Fawkes at once avowed his purpose to the magistrate, and declared that "if he had happened to be within the house when he took him, he would not have failed to have blown him up, house and all." His courage and composure were not disturbed when he was examined before the king and council. He gave his name as John Johnson, the servant of Thomas Percy, declared his intention to blow up the king, lords, and bishops, and others who should have assembled at the opening of the parliament, refused to accuse any one as his accomplice, and upon being asked by the king how he could enter upon so bloody a conspiracy against so many innocent persons, declared that "Dangerous diseases require a desperate remedy."

After having received the news of the apprehension of Fawkes, it was agreed by the conspirators, who had assembled at Ashby Ledgers, to take up arms with the few followers they could collect, and to endeavour to excite to rebellion the Roman Catholics in the counties of Warwick, Worcester, and Stafford, together with those of Wales. This scheme was immediately adopted; arms and horses were seized upon, and different parties despatched over the country. But all their efforts were in vain [DIE], and the failure of the project so complete, that their proceedings served no other purpose than to point them out as members of the confederacy. A party of the king's troops pursued some of the conspirators to Holbeach, and here an obstinate defence was made, in which the two Wrights, Percy, and Catesby were killed, and Rookwood and Thomas Winter wounded. The others were eventually taken. Tresham died a natural death in prison, and on the 27th of January 1606, eight persons, namely, Robert Winter, Thomas Winter, Guy Fawkes, John Grant, Ambrose Rookwood, Robert Keyes, and Thomas Bates, were tried at Westminster by a special commission, for being concerned in the powder-plot. Sir Everard Digby was arraigned and tried separately for the same crime. Upon the trials no witness was orally examined: the evidence consisted of the written declarations of Digby's servant and of the prisoners themselves. There is reason to believe that Fawkes was tortured in order to make him confess more fully. All the prisoners were found guilty, and upon all the sentence of death was passed. Care was taken to render their execution, which took place on the following Thursday and Friday, as solemn and impressive as possible.

Of the implication of the Jesuits in this conspiracy we shall speak in the article GARNET.

The atrocity of the design and the extent of the mischief con-

templated form the principal features of the gunpowder-plot. It is also remarkable for having been imagined and contrived, not by needy and low-born adventurers, but by gentlemen of good family and for the most part ample fortune. Its effect continued long to be felt; for it not only determined the feeble and wavering mind of the king against the Roman Catholics, but prejudiced the whole nation against them to such an extent, that not only were the severe acts then in force against them left unrepealed, but others equally harsh were enacted.

(Abridged and extracted from *Criminal Trials*, vol. ii.)

FAYETTE LA. [LAFAYETTE.]

FEDERICI CAMILLO, an Italian dramatic writer of note, whose real name, Giovanni Battista Viassolo, is, like that of Poquelin (Molière), quite lost in that which he assumed on joining a company of actors and beginning to write for the stage, and which he took from the title of his first dramatic effort, 'Camillo e Federico.' He was born at Garesio in Piedmont, 9th April 1749. Intended by his family for either the church or the bar, he was educated accordingly at Turin, but a passionate taste for the theatre, which had captivated his imagination while he was yet in his boyhood, prevailed over all other considerations. After being for some years in different companies in the double capacity of a performer upon the stage and a writer for it, he had, in 1777, the good fortune to find an excellent wife in the widow of Vicenzo Bazzigotti, who had realised some fortune by the theatre as a manager. The union was a happy one on both sides, for his wife was not only an amiable, but an intelligent and well-educated woman, possessing considerable literary taste. Federici now quitted the boards, and settled at Padua, where he employed himself in composing a succession of new pieces for the theatres of both that city and Venice. The juncture was a favourable one, for Goldoni's popularity was upon the wane, Gozzi had ceased to write for the stage, and Chiari was altogether forgotten. Without treading in the footsteps of Goldoni, Federici showed himself a worthy successor to him, inferior in comic force, but equally fertile in invention, and more varied in his subjects, many of his pieces being of a serious and sentimental kind—then just brought into fashion in Germany—accordingly answering better to the title of domestic drama than comedy. Federici's fame was not confined to the applause of the public whose favour he had more immediately in view, for his pieces were brought out with equal success in almost every theatre throughout Italy. But this full tide of prosperity was suddenly checked by a calamity that human prudence could neither foresee nor avert. He was attacked, in 1791, by a malady of the chest, that rendered him incapable of all exertion, either bodily or mental; nor did he ever afterwards recover from it further than to be able to dictate either to his wife or one of his sons, who served him as amanuenses. To add to his distress, soon after his disorder first seized him, he learnt that Pelland, the manager of one of the companies for which he had written, had surreptitiously sold twenty-nine of his pieces to a publisher at Turin—an injury which the increased celebrity it brought to his name could hardly soften.

Federici died 23rd December 1802. Amiable and unassuming, he had invariably resisted every proposal to his becoming a member of any literary or learned society; but he could not prevent one public mark of honour being paid him, namely, a medal being struck, with the head of Alfieri on one side, and his own on the other—as the effigies of the two dramatic writers whom Piedmont had reason to be proud of having given birth to. The high reputation he obtained has been confirmed by the testimony of foreign critics. One quality that recommends his productions is the healthy tone of morality that generally pervades them; neither is it the least of his merits, that he enlarged the resources of the Italian stage, by bringing subjects upon it that were calculated to amend and improve as well as amuse. Besides his serious pieces, he produced a few tragedies, which would, however, hardly have associated him in the manner above mentioned with Alfieri. The most complete collection of his works is that published under the title of 'Opere Teatrali di Camillo Federici,' Padova e Venezia, 1802-16, in fourteen volumes.

FEDOR IVANOVICH, the last Czar of Russia of the dynasty of Rurik, ascended the throne in 1584, after the death of his father, the celebrated tyrant Ivan Vasilevich. He was weak in body and mind; but the affairs of the government were conducted by Godoonoff during his reign, which was marked by some events that produced a decisive influence on the destinies of the Russian empire. It was during Fedor's reign that the peasants of Muscovy, who had hitherto enjoyed personal liberty, and could pass from the estate of one landowner to that of any other who would grant them better conditions, were converted into serfs attached to the ground (*servi glebæ adscripti*). This change was introduced in 1592, by the instrumentality of Godoonoff, who adopted that measure in order to obtain a party among the landowners. There had been, previously to that epoch, domestic slaves in Russia, but the predial serfs date only from that time. The Greek church of Moscow originally depended on the patriarch of Constantinople, who consecrated the metropolitan of Moscow; but after the capture of Constantinople by the Turks, the supremacy of the Greek patriarch over the Muscovite church was almost destroyed. Jeremy, patriarch of Constantinople, arriving in 1588 at Moscow, in order to collect alms for the erection of churches, was received with great honours by Fedor, who, being exceedingly devout, presented the head of the Greek

church with rich donations. Jeremy acknowledged the kindness of Fedor by consecrating a patriarch of Moscow, which dignity lasted till the time of Peter the Great, who abolished it, and declared himself the head of the Russian church. The conquest of Siberia, which had been commenced under Ivan Vasilevich, was completed under Fedor, during whose reign Russia made the first attempt to extend its influence over the Caucasian regions. The khan of Crimea invaded Russia, and penetrated to the capital, but he was repulsed from the walls of Moscow in 1591. The reign of Fedor is also remarkable for many diplomatical relations with foreign courts, and particularly with that of England. The most important event of Fedor's reign was his attempt to get himself elected king of Poland, in 1587. Fedor, or rather his prime minister Godonoff, promised to the states of Poland and Lithuania, that if they elected him king, he would unite all the forces of Moscow with those of Poland, and conquer the Crimea for Moscow, and Wallachia, Moldavia, and Hungary for Poland. The proposed union would have easily created a power capable of accomplishing not only the projected but even much more extensive conquests. Fedor's proposals were readily accepted by the majority of the Lithuanians, and they found many partisans even amongst the Poles. He was on the point of being elected, when the overbearing conduct of the Muscovite ambassadors destroyed the hopes of Fedor, and Sigismund Vasa, prince of Sweden, was elected king of Poland. Fedor died in 1591, and with him ended the dynasty of Ruric on the throne of Moscow, his younger brother Demetrius having been murdered through the instrumentality of Godonoff.

FEDOR ALEXEYEVICH, Czar of Russia, the eldest brother of Peter the Great, ascended the throne after the death of his father, Alexius Michaylovich, 1676, being only nineteen years of age. His youth and delicate constitution did not prevent him from displaying remarkable talents and energy, and the strong will which he constantly evinced to improve the barbarous institutions of his country, may almost justify us in supposing that but for his death he might have accomplished the greater part of what was afterwards performed by his brother Peter the Great. Fedor distinguished his reign particularly by putting an end to a monstrous custom which had acquired the force of law in Muscovy. According to this custom, called *Mestnichestvo* (literally 'placeship,' from *Mesto*, place), no member of a great family could be put under the command of or give precedence to a person whose birth was considered inferior to his. All the noble families of the country were registered in a roll called '*Rasriad*,' or '*Arrangement*,' and all the disputes which frequently arose about precedent, not only at the court but even in active service, were settled by referring to this kind of herald's office. Such a system necessarily frequently proved very detrimental to the public service; but it was so deeply rooted, that even Ivan Vasilevich, who deluged Muscovy with blood and decimated its nobility, was unable to destroy the *Mestnichestvo*. Fedor abolished the practice by very simple means: he assembled his boyards, or principal nobles, and having expostulated with them on the bad consequences of the above-mentioned custom, threw, in the presence of the assembly, all the rolls of the '*Rasriad*' into the fire. The genealogical records of the Muscovite nobles, which did not relate to their claims of precedence, were spared by Fedor, and arranged in order by his command. Fedor died in 1682, at the age of twenty-five.

FEITH, RHYNVIS, a Dutch poet of high reputation, was born on the 7th of February 1753 at Zwolle, the chief town of the province of Overijssel, in which the family had been a noted one since the time of Everard Feith, a distinguished classical scholar, who flourished in the sixteenth century. Rhynvis, who was the only child of his parents, received an excellent education under a private tutor, and afterwards studied at Leyden, where he took his degree of Doctor of Laws in 1770, at the unusually early age of seventeen. At the age of nineteen he was married to Okje Groeneveld, with whom he spent the next forty years of his life in an uninterrupted current of domestic happiness, sweetened by literary fame. His first poem, '*The Transitoriness of the Universe*,' which appeared in 1779, was followed by sufficient prose and verse to fill about thirty octavo volumes. The most successful poem of all, '*Fanny*,' which was published in 1787, was devoted to celebrating the connubial felicity of an imaginary Fanny and Edward, concluding with a scene of Fanny at Edward's grave. It was so popular for some years in Holland that it was customary for young persons to learn it by heart, and the whole was set to music. Its reputation has now entirely faded; and two prose novels by the author, '*Ferdinand and Constantia*' and '*Julia*,' written at the time of the Werter mania, were from the first condemned as too sentimental. The other works of Feith have been more fortunate. They are almost all either of a religious or a patriotic cast, and the latter are eminently spirited. A series of his odes, which commences with the outbreak of the American war and lasts to about the commencement of the French revolution, is interesting in an historical as well as a poetical point of view, from the light it throws on the sentiments of the Dutch patriotic or anti-Oranger's party of the period. His '*Song of Triumph on the Anniversary of the Victory of the Doggerbank*,' '*Washington and Necker*,' '*To the Foes of Netherland*,' are all animated with the same feelings—abame at the degeneracy of his countrymen compared with their glorious ancestors of the times of Tromp and De Ruiter, a most exaggerated estimate of these bygone

heroes, and a bitter hostility to England, which, at the time of the American war, is spoken of as the relentless tyrant of the seas, and viewed in no other light. The same spirit pervades a very fine eulogy on De Ruiter, and an ode on the same hero, both of which were sent anonymously by Feith in 1785 to a society which offered a reward for poems on the subject, and to the first of which the society awarded its first prize, a gold medal, and to the other its second, a silver one, unaware of course at the time that they were from the same hand. Feith closed the first series of his patriotic odes at the time of the Dutch revolution of 1787, too indignant at the turn affairs had taken to continue them, and little foreseeing at that time what more serious calamities were in store for Holland. He resumed them in 1800, when the country was at the lowest ebb of its fortunes, and he had the satisfaction of concluding the whole with an ode on the fall of Napoleon. Of his didactic poems, '*The Grave*' and '*Old Age*' are regarded as masterpieces. He wrote four tragedies, one of which is on the subject of Lady Jane Grey, but the best is that entitled '*Thirsa, or the Triumph of Religion*,' the heroine of which is the Hebrew mother recorded in the book of Maccabees, who exhorted her seven sons to martyrdom. He wrote, in conjunction with Bilderdijk [BILDERDIJK], a new version of Van Haren's poem of '*De Geuzen*,' and edited a complete edition of the works of Jacob Cats, the preface to which, a panegyric on the Holland of the seventeenth century, is a fine specimen of vigorous prose. His prose works are chiefly of a religious character, written for prizes offered by a society at the Hague and by the trustees of the Teylerian legacy, a fund analogous to the Bridgewater fund, founded by a miser of Haarlem, which has given birth to a long series of quarto volumes. Another of his works which gained a prize is an '*Essay on Epic Poetry*,' in which he gives an account of his intercourse with Klopstock during an excursion to Hamburg, which seems to have been his only taste of foreign travel. The usual course of his life was to spend the winter months at Zwolle, where he filled some municipal offices, and the summer ones at Boschwyk, a rural retreat near that town, to which he was much attached and where he gratified his taste for landscape gardening. His domestic tranquillity was first broken by the death of his wife in 1813, a loss which he never entirely recovered. In the next year he was invited to form one of the '*notables*' assembled at Amsterdam to consult on a constitution, but he declined on account of old age and failing health. He survived however till 1824, when he died, after a tedious illness, on the 8th of February, one day after his seventy-first birthday. He left nine children, one of whom wrote a poem of some merit descriptive of his father's funeral, which is given in the volume entitled, '*Gedenksuil voor Mr. Rhynvis Feith*,' published at Leeuwarden in 1825. A collected edition of his works, compressed into thirteen volumes, was printed in the same year at the Hague, with a life by Van Kampen.

FEJÉR, GYÖRGY, a very industrious Hungarian author, was born at Keszthely in the year 1766, studied at the university of Pesth and Buda, was for fifteen years a priest at Stuhlweissenburg, and after occupying the post of professor of dogmatic theology and some others of an analogous character, became in 1824 librarian of the university of Pesth and Buda. During all this period his pen had been in incessant activity, and in a list of his own printed works which he published in 1830 he gives the titles of 102, beginning with the year 1784 when he was eighteen. They are of various kinds from poetry to dogmatic theology, and of various sizes from mere pamphlets to works in five or more volumes, all in the Latin language or in the Hungarian. He specifies some articles of considerable extent which had appeared in periodical publications, but very many of less consequence in the '*Halle Litteratur-Zeitung*,' and the '*Tudományos Gyűjtemény*,' are passed over. Of the '*Tudományos Gyűjtemény*,' a very valuable publication, which was for a quarter of a century, from 1817 to 1841, the best magazine and review that Hungary possessed, he was the original editor as well as a frequent contributor to its pages. His great contribution to the literature of his country is however the '*Codex diplomaticus Hungaricæ ecclesiasticæ ac civilis*,' published between 1829 and 1844 in twelve so-called volumes, which are generally bound in eight-and-twenty, some of the volumes being divided into several sections, each of the size of an ordinary volume. In this '*Codex*,' which is a general collection of charters and other documents relating to Hungarian history from the earliest times to the year 1440, it is said that many errors and inaccuracies are to be found, but the work is a stupendous monument of industry and perseverance, especially when the circumstances under which it was produced are considered. "I have sought for the documents it contains," says Fejér, in the preface to one of the volumes of the *Index* published in 1835, "and applied for them in season and out of season; I have transcribed them with my own fist ('*proprio transcripai pugno*'), and let me be allowed to add, I have been led by no hope of recompense; I have had no patronage and no assistance; this work I dedicate to the public use at an expense from my own purse of 12,000 florins" (about 1200*l.*) Several Latin dissertations on disputed points in Hungarian history are interspersed, and the whole forms an appropriate companion to Katona's great '*Historia critica regum Hungaricæ*.' The last works of Fejér that we have seen mentioned are, '*A Kunok eredetéről*,' ('*On the Origin of the Huns*'), and '*A politikai Forradalmok okai*,' ('*The Causes of Political Revolutions*'),

both published in 1850. The last work was prohibited by the Austrian government as of too liberal a character. We have seen no mention of his death; if living, he must be at the age of ninety.

FELIBIEN, ANDRÉ, was born in May 1619 at Chartres, department of Eure-et-Loir, France. He was appointed secretary of embassy to the Marquis de Fontenay-Mareuil on his mission to Rome in 1647; and there formed an acquaintance with Poussin and other eminent artists, and gave much attention to the study of the Fine Arts. On his return to France he married and settled at Chartres, but subsequently went to Paris, where he acquired the friendship of Colbert, from whom he received in succession the appointments of Historiographer du Roi, superintendent of the royal buildings, and of arts and manufactures, keeper of the antiquities of the Palais Brion, and secretary of the Académie d'Architecture, instituted in 1671. Felibien was one of the eight who formed the Académie des Inscriptions, founded by Colbert in 1663. Louvois appointed Felibien comptroller-general of the highways and bridges, and he held some other offices. As a kind of official director in matters of art in the court of Louis XIV., Felibien's position was one of great influence, and his writings on artistic matters were long regarded as of high authority. The work by which he is now chiefly known is his *'Entretiens sur les Vies et sur les Ouvrages des plus excellents Peintres anciens et modernes,'* 4to, Paris, 1666. This work was several times reprinted in other countries as well as in France, translated into various languages, and is still regarded as a valuable book of reference. It is by far the best of Felibien's productions, but is crude, immethodical, and diffuse. He also published *'Origine de la Peinture,'* 4to, Paris, 1660; *'Principes de l'Architecture, de la Sculpture, de la Peinture, et des autres Arts qui en dépendent, avec un Dictionnaire des Termes propres,'* 4to, Paris, 1676-90; *'Conférences de l'Académie de Peinture,'* 4to, Paris, 1669; and descriptions of the palace of Versailles, and of its artistic treasures, of the Abbey of La Trappe, and of various entertainments given by Louis XIV., besides some religious pieces, translations, &c. All the inscriptions placed in the court of the Hôtel de Ville at Paris between 1660 and 1686 were written by Felibien. He died June 11, 1695.

JEAN FRANÇOIS FELIBIEN, eldest son of André, was born in 1758; he inherited his father's love for the arts, assisted him in several of his works, and succeeded him in some of his offices. He was a conseiller du roi, secretary of the Académie d'Architecture, and treasurer of the Académie des Inscriptions. His best known work is the *'Recueil Historique de la Vie et des Ouvrages des plus célèbres Architectes,'* 4to, Paris, 1687, which was several times reprinted, but is a work of little value. He also wrote several descriptions of public buildings. He was removed from his office of treasurer of the Académie des Inscriptions in 1716, on suspicion of being concerned in some dishonourable transactions, and in 1722 his name was struck off the list of the Academy. He published a *'Requête au Roi, pour demander d'être remis sur la liste des Académiciens, et de conserver son rang dans l'Académie,'* 12mo, 1722; and an arrêt du conseil of July 18, 1722 acquitted him of the charges brought against him, but he was not re-admitted into the Academy. He died at Paris, June 27, 1733.

DOM MICHEL FELIBIEN, another son of André, was born at Chartres, September 14, 1666. At the age of sixteen he entered the congregation of St. Maur. Feeble health preventing him from active exertions, he devoted himself chiefly to literature. His principal work is a *'Histoire de l'Abbaye Royale de St. Denis,'* fol., Paris, 1706. This work contained besides an elaborate description of the church, an account of its privileges and lives of its abbés, of its benefactors, and of the celebrated men connected with it. So high a reputation did this work gain for its author as a learned, painstaking and faithful historian, that the merchants of Paris by their provost, M. Bignon, applied to Dom Felibien to write a history of Paris. He entered upon the task with ardour, and published his *'Projet'* in 1714, but died before he could complete his undertaking, September 25, 1719. It was finished by Dom Lobineau, and published in 5 vols. fol., Paris, 1755, under the title of *'L'Histoire de la Ville de Paris,'* with an éloge of Dom Michel Felibien prefixed.

FELIX I., Pope, a native of Rome, succeeded Dionysius the Calabrian as bishop of that city A.D. 271, and suffered martyrdom in 275. He was succeeded by Eutychianus, bishop of Luna. There is extant an epistle of Felix to Maximus, bishop of Alexandria, against Paul of Samosata.

FELIX II., by some styled III., on account of an anti-pope who assumed the title of Felix II. in the schism against Liberius (A.D. 355-66), was a native of Rome, and succeed Simplicius in the year 483. He had a dispute upon questions of ecclesiastical supremacy with Acacius, bishop of Constantinople, who was supported by the emperor and by most of the eastern clergy; in consequence of which a schism ensued between the Greek and Latin churches, which continued after the death of Felix, which happened in 492. He was succeeded by Gelasius I.

FELIX III., also called IV., a native of Beneventum, succeeded John I. A.D. 526, and died in 530. He was succeeded by Boniface II.

FELIX V. [AMADEUS.]

* FELLOWS, SIR CHARLES, was born in 1799, at Nottingham, where his father, John Fellows, Esq., held a property which the family had possessed during four previous generations. In the early

part of the year 1838 Mr. Charles Fellows made a tour in that part of Asia Minor which lies between 42° and 36° N. lat., 26° and 32° E. long. He started from Smyrna on the 22nd of February. Parts of his route, which lay through the interior and southern districts of Asia Minor, had not, as far as is known, been previously traversed by any European, and led him to the remains of several ancient cities. All these cities had their origin prior to the conquest of the country by the Romans in the third century B.C., and some of them were of very remote antiquity. Having passed through Lydia and Mysia, and crossed the Sea of Marmora to Constantinople, he proceeded thence through Bithynia, Phrygia, Pisidia, and Pamphylia. When he was approaching Lycia it occurred to him that Colonel Leake and others had remarked that the valley of the river Xanthus had not been visited, and that it would probably be found to contain remains of ancient cities. Mr. Fellows therefore resolved to explore it, and commenced his researches at Patara, at the mouth of the Xanthus. Only nine miles up the river he discovered on a bold rocky elevation the extensive ruins of the city of Xanthus, the former capital of Lycia. Some fourteen or fifteen miles higher up the river he discovered in a most beautiful site the ruins of another large city, which he found by inscriptions to be the ancient city of Tlos. Among the ruins of Xanthus were some exceedingly interesting remains of architecture, with many beautiful sculptures. Having made drawings of the architectural remains and sculptures, and copied the most legible of the inscriptions, he continued his journey through Caria and Lydia to Smyrna, where he arrived on the 12th of May.

Mr. Fellows, after his return to England, published *'A Journal written during an Excursion in Asia Minor, by Charles Fellows, 1838,'* 8vo, London, 1839. This work excited a very strong interest, and Mr. Hawkins of the British Museum, authorised by the trustees, requested Lord Palmerston to ask the Sultan for a firman granting leave to bring away some of the works of art which Mr. Fellows had discovered. Lord Palmerston accordingly wrote to the British minister at Constantinople, directing him to make application for the necessary firman, or letter of authorisation.

Not anticipating any difficulty in obtaining the firman, Mr. Fellows offered his services to the British Museum in pointing out such of the works of art as it would be most desirable to bring to England. His offer was accepted by the authorities of the British Museum, and in the autumn of 1839 he again left England for Lycia, more fully prepared than before for an examination of its geography and remains of antiquity. He also took with him Mr. George Scharf, then a young artist, to assist him in making the drawings. He proceeded to Smyrna, and thence to Lycia, through which he made another excursion, and discovered thirteen other cities, each containing works of art. At length, on the 7th of March 1840, he received a letter from Lord Ponsonby, informing him that the Porte objected to the extent and generality of the required firman.

Having returned to England, Mr. Fellows laid his second journal before the public, *'An Account of Discoveries in Lycia, being a Journal kept during a Second Excursion in Asia Minor,'* 8vo, London, 1841. The public read the work with increased interest and admiration, and the government with increased zeal requested Lord Ponsonby to use his influence with the Porte to obtain the firman. At length, in October 1841, the trustees of the British Museum were informed that the firman was obtained.

On the 12th of October 1841, Mr. Fellows wrote to the trustees of the British Museum, offering his services to accompany the expedition, and to point out the objects for removal, requiring no remuneration, and offering to pay his own expenses, except a free passage to Lycia and back again, and rations with the officers during the voyages. His offer was again accepted, and on the 16th of October he was on board the Tagus steam-boat off Southampton, ready to sail. He arrived at Smyrna on the 15th of November. Here he received the supposed firman, which proved to be nothing more than a letter requiring information as to the precise object of the explorers. Finding that there had been some mistake in making the application to the Porte, Mr. Fellows went himself to Constantinople, explained the matter to the prime minister of the Sultan, and obtained without difficulty the required firman. After purchasing spades, pick-axes, &c., he joined the expedition at Rhodes on the 18th of December. Here another difficulty occurred. The district of the Pasha extended only to one side of the river Xanthus, and the ruins were on the other side, in the district of the Pasha of Adalia. The Pasha very kindly however took on himself the responsibility of authorising them to proceed with their work. The Xanthus in the winter season is much wider than the Thames at Richmond, contains a very great volume of water, and is an exceedingly powerful and wild river. They were consequently four days partly rowing and partly dragging with ropes the two boats which contained their stores, though the distance is only nine miles, which they descended in a boat in three quarters of an hour. They pitched their tents in the plain immediately below the ruins of the ancient city on the 30th of December. After they had been some weeks at work among the ruins, their proceedings were confirmed by a message from the Pasha of Adalia, saying that the Queen of England was good, the Sultan was good, that they were all brothers, and were at liberty to take what they liked. Having, as far as their means

allowed them, accomplished their undertaking, they re-embarked, and arrived at Rhodes with their packages on the 5th of March 1842.

Another expedition was afterwards sent out by the trustees of the British Museum, also under the superintendence of Mr. Fellows, and the collected treasures, consisting of twenty cases of marbles and casts, were safely shipped on board her Majesty's ship *Medea* on the 15th of March 1844, leaving seven cases of the most unwieldy masses to be afterwards taken on board a larger vessel.

These interesting remains of ancient art are now deposited in one of the rooms of the British Museum, which is called the Lycian Saloon, and they are described in the 'Synopsis of the Contents of the British Museum.'

Mr. Fellows in 1845 received the honour of knighthood for his discoveries in Lycia, and his services in the removal of the Xanthian Marbles. In the same year he married the only daughter of Francis Hart, Esq., of Nottingham. She died in 1847, and in 1848 he married the relict of the late William Knight, Esq., of Oatlands, Hertfordshire.

In translating and elucidating the inscriptions contained in the first of his Journals, Sir Charles Fellows was assisted by Mr. James Yates: in those of the second by the late Mr. Daniel Sharpe, president of the Geological Society. Several of the inscriptions are in the Lycian language, which was different from the Greek.

In 1843 Sir Charles Fellows, in consequence of some mis-statements which had been made, published a pamphlet, entitled 'The Xanthian Marbles: their Acquisition and Transmission to England,' 8vo. He has since published 'An Account of the Ionic Trophy Monument excavated at Xanthus,' 8vo, 1848, and 'Coins of Ancient Lycia before the reign of Alexander; with an Essay on the Relative Dates of the Lycian Monuments in the British Museum,' 8vo, 1855. He has also published his two Journals in one volume, in a cheaper form, under the title of 'Travels and Researches in Asia Minor, particularly in the Province of Lycia,' 12mo, 1852.

FELLTHAM, OWEN, lived in the time of James I.; but the particulars of his life are almost entirely unknown. From his statement that a part of his 'Resolves' was written when he was only eighteen, he must have been born before 1610: he is believed to have been living in 1677, when the tenth edition of his work was published. He appears to have resided during the greater part of his life in the house of the Earl of Thomond, as is supposed in the capacity of secretary. To the lover of English literary antiquities he is known as the author of a curious book called 'Resolves,' consisting of pious and moral treatises collected into centuries; of which the first edition was published in 1628. It somewhat resembles Lord Bacon's Essays, and exhibits a surprising exuberance of wit and fancy. Metaphor follows metaphor; and they are not merely introduced as an idle and unmeaning sport, but are the exponents of thoughts in themselves often acute and profound. All liberal minds must admire the spirit in which the book is written. Felltham displays himself as a man delighting in reflection, and at the same time as a man of the world; as one of sincere and fervent piety, but at the same time as one of a cheerful and lively temper, loving the good things of this life, and always preserving a clear understanding. His style is however often affected, and he not unseldom indulges in a paradoxical strain. A series of poetic pieces entitled 'Lusoria,' and a 'Brief Character of the Low Countries,' with 'Nineteen Letters on Various Subjects,' are usually bound up with the early editions of the 'Resolves.'

FELTON. [BUCKINGHAM, DUKE OF.]

FELTRE, HENRI-JACQUES-GUILLAUME-CLARKE, DUC DE, was a native of Landrecies, and traced his descent from one of those Irish families who the fall of James II. compelled to establish themselves in France. He was born October 17, 1765; entered the Military School of Paris, as gentleman cadet, on September 17, 1781, and left it November 11, 1782, as second lieutenant in the regiment of Berwick. He became a cornet of hussars in 1784, and a captain of dragoons in 1790. This rapid promotion was very unusual at that period; and the young officer owed his good fortune to the protection of the Duc d'Orléans. He saw much service during the first campaigns of the Revolution; and his good conduct procured him the rank of lieutenant-colonel February 5, 1792, at the age of twenty-seven. For his skill and bravery in a combat near Landau, on the 17th of May 1793, he was rewarded with the command of a brigade, conferred on the field of battle.

On the 12th of October 1793, General Clarke was removed by the commissioners deputed by the Convention to purge the army of every general officer belonging to the noblesse; nor did he recover his rank until after the fall of Robespierre. But he had been introduced to Carnot, and that sagacious minister, appreciating his character and zeal, gave him his protection, and placed him at the head of an office of military topography. He became a general of division in 1795, and the following year he was sent by Carnot on a mission to Vienna, with secret instructions to visit the various seats of war in Germany and Italy, and to watch the rising ambition of Napoleon I. But the office of a spy was not suited to his character; and yielding to the spell of that fascination, which few men could resist, he attached himself to the fortunes of Napoleon I., and continued in his service for eighteen years.

After the battle of Marengo the First Consul commissioned General Clarke to open the negotiations of Luneville, appointed him governor

of that town, September 1800, and then made him minister of France at Florence. In 1805 he accompanied Napoleon I. to the campaign in Germany, was present and took part in the capture of Ulm; and after the fall of Vienna was made governor of that city, and of a vast extent of territory recently subdued. On the 27th of October Napoleon I. appointed him governor of Berlin, observing—"I wish in one year to place under your orders the capitals of two monarchies." Although one of the most upright men in the French army, General Clarke was severe, and even cruel, and many complaints were preferred against him during his government for his inexorable rigour. But if he was sometimes strict, he was always just; he protected the inhabitants of the cities he held under his authority from the rapacity of other generals, and compelled Vandamme to desist from plundering the palace of Potsdam, and selling the king's furniture for his own advantage. The skill and resolution shown by him during his governments of Vienna and Berlin were fully appreciated by the emperor, and in spite of the ill-will and clamour of certain generals and marshals, he was appointed to succeed Berthier, as Minister of War, in 1807. In this high charge he displayed honesty, diligence, considerable administrative skill, and a familiar acquaintance with every branch of military science. Murmurs without end assailed him, and complaints without number reached his master. But Napoleon I. knew how to value integrity in a minister, and not only created him Duc de Feltre in 1809, but retained him in his office until his own fall, in 1814.

The Duc de Feltre accompanied Louis XVIII. to Ghent in 1815, and after the second return of the Bourbons was reinstated in his old office as Minister of War. Again he evinced the same seal, and the same fearless opposition to private interests. The clamour of disappointed men, ambitious of places without the due qualifications to fill them, was renewed. But Louis XVIII., not so unyielding as his minister, gave way to these misrepresentations, and sent the duke into honourable exile at Rouen, with the command of the 15th Division. He died on the 28th of October 1818, at the age of fifty-three. His disregard of all personal interests had been so great, that instead of leaving a princely fortune, to his family, like most of Napoleon's ministers and generals, he left them in comparative indigence; the duchess being compelled to sell immediately after his death the small estate he had possessed at Puteaux, near the bridge of Neuilly.

(Rabbe; Thiers, *French Revolution*; *Biographie Universelle*.)

FENELON, FRANÇOIS-DE-SALIGNAC-DE-LAMOTHE, was born at the Château de Fenelon, in Perigord, in the year 1651. So rapid was his progress that he preached a sermon at the early age of fifteen before a select assembly at Paris, whither he had been called by his uncle, the Marquis de Fenelon, who afterwards fearing lest the praises of the world should create pride and vanity, caused him to enter the seminary of St. Sulpice, and there for several years imitate 'the silence of Jesus.' Here he took orders. His first work was a treatise, 'De l'Education des Filles,' which is well known, and has been translated into our language. The intimacy which he formed with Bossuet, and Bossuet's example, led him to write a treatise against heretics, entitled 'Du Ministère des Pasteurs,' in which heretics are attacked, though with more moderation than they had been by Bossuet. Fenelon being intrusted by Louis XIV. with a mission to Poitou, to convert the Protestants, refused the aid of dragoons, and employed persuasion alone as an instrument of conversion. His conduct on this occasion gained him many friends. In 1689 he was appointed tutor to the young Duke of Burgundy, which brought him into attendance on the court. Though the polish and grace which pervade his writings extended to his conversation, he never seems to have been a great favourite of Louis; his political opinions always tended to liberty, and in a letter to Mad. de Maintenon he animalverted rather freely on the character of the king. Notwithstanding this, after he had been tutor for five years, Louis made him archbishop of Cambray. Unfortunately, at the very moment when he had gained this elevated post, that series of events commenced which caused his future disgrace. He formed an acquaintance with the celebrated quietist, Madame Guyon, who was at first in high favour with Mad. de Maintenon, and who was encouraged by her to spread her doctrines at St. Cyr. This lady was afterwards persecuted by Bossuet; and as Fenelon was suspected of favouring her doctrines, Bossuet required him to condemn them. Not only did Fenelon refuse, but he published a book called 'Explication des Maximes des Saints,' in which the principles of quietism were openly avowed. Upon this, Bossuet denounced him to the king as a heretic. To increase his troubles, his palace caught fire about the same time, and all his manuscripts and books were destroyed. The persecution of Bossuet continued; and the protection of Mad. de Maintenon, who had at first encouraged Fenelon, was withdrawn. Bossuet required that the difference should be settled by a controversy: Fenelon would not accede to these terms, but offered to submit his book to the tribunal at Rome. His persecutor however succeeded so far as to cause him to be banished from the court, and endeavoured, though unsuccessfully, to involve Beauvilliers, governor to the Duke of Burgundy, in his disgrace. Pope Innocent VIII., though strongly urged by Louis, was not willing at once to condemn a prelate so noted for learning and piety, and a violent paper war was waged by both parties. At last the papal letter arrived, and the archbishop of Cambray was forced to submit; he signed a renunciation, and would

have been restored to regal favour had not the celebrated romance of 'Telemaque,' which he had written some years before, been published against his will through the treachery of a servant. Several passages in this work were suspected by Louis to be directed against himself; it was suppressed in France, but rapidly circulated in Holland. Hearing of the unfortunate impression which his book had made, Fenelon resolved to remain quietly in his diocese. Cambrai being situated on the frontiers of France, he was visited by many illustrious foreigners. Fenelon's acts of benevolence were munificent: in the year 1709 he fed the French army at his own expense. It has been already remarked that his political opinions were liberal; he had always conceived it just that the people should have a share in the government, and it was expected that the Duke of Burgundy would have acted in accordance with his preceptor's views. But all hopes of this sort were cut off by the sudden death of that prince. Fenelon himself died Jan. 7, 1715.

The works of Fenelon are very numerous; consisting, besides the romance of 'Telemaque,' of a variety of religious and moral treatises. 'Telemaque' has been translated into every European language, and was until lately read at almost every European school. Had it been written in this age, it is very questionable whether its popularity would have been so great; the spirit of the Greeks is much better understood than it was formerly, and the classic reader, though he may admire the language of 'Telemaque,' as well as the general accuracy of the writer's information on matters of ancient history and geography, will find it strange that the sentimental speeches, however good in themselves, should flow from the mouth of Homeric heroes, who of all beings were the least moralising, in the modern sense of the word. The religious and moral essays of Fenelon are only calculated for persons in whose mental constitution warmth and susceptibility are predominant, and who can suffer themselves to be led on by the fervour and eloquence of the author. To the cool and more intellectual inquirer after truth his works will appear diffuse and tedious. So much use does he make of the imaginative faculties, that he exhorts teachers to impress on the minds of children that the Deity is sitting on a throne, with very bright eyes looking through everything, and supporting the universe with his hands. Hence his natural theology is chiefly the ejaculation of a pious man admiring the works of Nature. In politics Fenelon's opinions are far in advance of his age and country: in one of his treatises he declaims against checking liberty of conscience, and boldly proclaims the injustice of levying taxes without the sanction of a parliament. A handsome quarto edition of his works was published at Paris in 1787.

FENTON, ELIJAH, was born in Staffordshire, in the year 1683. Being designed for the church, he was admitted a pensioner of Jesus College, Cambridge, in 1700. After taking a bachelor's degree, he was forced to leave the University in consequence of being a non-juror. He became secretary to the Earl of Orrery, and accompanied that nobleman to Flanders. After his return to England, in 1705, he accepted the situation of assistant at Mr. Bonwicke's school, at Headly in Surrey, and subsequently became head-master of the free grammar-school at Sevenoaks in Kent. Mr. St. John (afterwards Lord Bolingbroke) persuaded him to retire from this school, promising to do great things for him, which promises were never fulfilled. Lord Orrery again befriended him, and made him tutor to his son, Lord Broghill. This office lasted for six or seven years, during which Fenton became acquainted with Pope, and assisted him in the translation of the 'Odyssey.' The first, fourth, nineteenth, and twentieth books are said to be the work of Fenton. In 1723 he produced, at the theatre in Lincoln's Inn Fields, a tragedy, called 'Marianne,' which was so successful that he is reported to have gained 1000*l.* by its representation, and to have employed great part of the money in paying off the debts which St. John's conduct had caused him to incur. In 1727 he revised a new edition of Milton's works, and prefixed a life of the author; and in 1729 he published a fine edition of Waller. Through the recommendation of Pope, he became tutor to the son of Lady Trumbull; and when that occupation was at an end, she made him auditor of her accounts. He died in 1730.

All biographers bear testimony to Fenton's character as an upright and honourable man. His poetical works are but few in number, and consist of short pieces, chiefly paraphrases from the ancients. As they have scarcely any merit but that of correct versification, they will probably never be rescued from the neglect into which they now have sunk. The tragedy of 'Marianne,' like most of that time, is totally forgotten.

FERDINAND I. of Austria, younger brother of Charles V., was born in 1503. He was elected king of the Romans during his brother's reign, and succeeded him as emperor in consequence of the abdication of Charles, which was sanctioned by the diet of the empire in 1558. Ferdinand had married, in 1521, Anna, daughter of Ladislaus VI., king of Bohemia and Hungary, and sister of Louis, who having succeeded his father in the crown of those realms, was killed in the disastrous battle of Mohacz, by the Turks, in 1526, and left no issue. Ferdinand, claiming a right to the succession in the name of his wife, the states of Bohemia acknowledged him, but in Hungary a strong party declared for John of Zapoly, palatine of Transylvania. This was the beginning of a long and desolating war, interrupted by occasional truces, in which Solymán, sultan of the Turks, interfered on behalf of

John, and after John's death, in 1540, on behalf of his son, Sigismund, who continued to hold a part of Hungary till the death of Ferdinand. In Bohemia the religious disputes between the Callixtines, who were a remnant of the Hussites, and the Roman Catholics, occasioned considerable uneasiness to Ferdinand, who found at last that it was his policy to tolerate the former. At the same time however he effected a thorough change in the institutions of that kingdom, by declaring the crown of Bohemia hereditary in his family, without the sanction of the states. This gave rise to a confederacy which opposed Ferdinand by force of arms, but was at length overpowered and dissolved. On being proclaimed Emperor of Germany, after having signed certain conditions with the electors, which defined the boundaries of the imperial authority, and gave security to the Protestant religion, Ferdinand notified his election to Pope Paul IV., expressing a desire to be crowned by his hands. Paul refused, under the plea that the abdication of Charles V. was effected without the consent of the papal see, and required a fresh election to be made. Ferdinand, indignant at these pretensions, ordered his ambassador to quit Rome. Paul, however, dying soon after, his successor, Pius IV., showed himself more tractable in acknowledging Ferdinand as head of the empire. It was then resolved by the electors, Roman Catholic as well as Protestant, that in future no emperor should receive the crown from the hands of the pope, and that, instead of the customary form in which the emperor-elect professed his obedience to the head of the church, a mere complimentary epistle should be substituted. Thus ended the last remains of that temporal dependence of the German empire on the see of Rome, which had been the subject of so many controversies and wars.

Ferdinand continued throughout his reign to hold the balance even between the Protestants and Roman Catholics with regard to their mutual toleration and outward harmony; he even endeavoured, though unsuccessfully, to effect a union of the two communions, by trying to persuade the Protestants to send deputies to, and acknowledge the authority of the council assembled at Trent. This however they refused to do, unless their theologians were acknowledged as equal in dignity to the Roman Catholic bishops, and unless the council were transferred from Trent to some city of the empire. Ferdinand, on the other side, in order to conciliate some at least of the various dissenting sects in his own hereditary states, attempted to obtain of the pope, among other concessions, the use of the cup at the communion-table for the laity, and the liberty of marriage for the priests. Pius IV., however, would not listen to the latter proposition, and the negotiations were still pending with regard to the former, when the emperor died at Vienna, in July 1564. He left three sons: 1, Maximilian, who succeeded him as emperor, archduke of Austria, and king of Bohemia and Hungary; 2, Ferdinand, whom he made count of Tyrol; 3, Charles, whom he appointed Duke of Styria, Carinthia, and Carniola. Upon the whole, the administration of Ferdinand was able and enlightened; he maintained religious peace in Germany, he effected some useful reforms, and he saw the closing of the council of Trent.

FERDINAND II. of Austria, son of Charles, duke of Styria, and grandson of Ferdinand I., succeeded his cousin Matthias in 1619. But the states of Bohemia, who were already in open revolt against Matthias, both from political and religious grievances, refused to acknowledge Ferdinand, and declared the throne vacant. Count Thörn, who was at the head of the Bohemian insurgents, was joined by the dissidents of Moravia, Silesia, and Upper Austria, and Ferdinand found himself besieged within the walls of Vienna by the insurgents, who threatened to put to death his ministers, to confine Ferdinand himself in a monastery, and educate his children in the Protestant faith. His friends however found means to raise the siege, and Ferdinand hastened to Germany to claim the imperial crown, having been acknowledged King of the Romans during the reign of his predecessor. He carried his election by means of the Roman Catholic electors, who formed the majority. But the Bohemian states elected as their king Frederic, count Palatine, son-in-law of James I. of England, and Hungary joined in the revolt, supported by Bethlen Gabor, Prince of Transylvania. This was the beginning of the Thirty Years' War, a war both religious and political, and one of the most desolating in the history of modern Europe. In the midst of these difficulties Ferdinand was ably supported by his general, Count de Tilly, who re-conquered Bohemia and expelled Frederic. Hungary was soon after obliged to submit, and Bethlen Gabor sued for peace. Another confederacy was formed against Ferdinand by the Protestant states of Saxony, supported by Christian IV. of Denmark, who put himself at their head in 1625. Ferdinand opposed to him Tilly and Waldstein, or Wallenstein, another commander of extraordinary abilities. In two campaigns the confederates were defeated, Christian was driven into his hereditary states, and the peace of Lubeck, 1629, put an end to the war. Ferdinand now adopted measures of retaliation which drove the Protestants to despair: he abolished the exercise of the Protestant religion in Bohemia; he exiled or put to death the leaders of that and other dissenting communions; he confiscated their property; seven hundred noble families were proscribed, and the common people were forced to change their faith. Above 30,000 families, preferring their consciences to their country, sought refuge in Protestant states. Ferdinand

intended to carry on the same sweeping measures throughout Germany, but here he adopted a more cautious plan. He began by dividing the Lutherans from the Calvinists, and he called for the execution of a former act which allowed to the Lutherans only the free exercise of their religion, but condemned the Calvinists to apostasy or exile. He also insisted on the restitution of such ecclesiastical property as the Protestants had seized since the treaty of Passau in 1552. The Protestant princes were compelled in many cases to give up the lands and revenues which they had seized to the monastic and collegiate bodies, their former owners. But the Roman Catholic princes prevented the entire execution of the decree. They had themselves, in the general confusion which followed the reformation, seized upon ecclesiastical property, which they did not wish to restore, and they moreover felt jealous of the threatening power of the house of Austria, allied as it was to the Spanish branch of the same house. They feared also that they might be made as completely dependant upon the emperor as the grandes of Spain had become upon their king. In this feeling they secretly encouraged their Protestant countrymen in resisting the further execution of the decree. The diet at Ratisbon, on Ferdinand's request that his son Maximilian might be elected King of the Romans, replied by insisting that the emperor should reduce his army and dismiss Waldstein, who had rendered himself hateful by the disorders of his troops. Soon afterwards Gustavus Adolphus landed in Pomerania, and put himself at the head of the Protestant party in Germany. The events of the memorable campaigns that followed are well known from Schiller's 'Thirty Years' War,' and other historians. [GUSTAVUS ADOLPHUS.] The Protestant cause triumphed in Germany until Gustavus fell at the battle of Lutzen, 1632, after which the Swedes and German Protestants continued the war; but the victory of Nordlingen, gained by Ferdinand, eldest son of the emperor, had the effect of detaching the Elector of Saxony from the Swedes, an example followed by almost all the other German states. Ferdinand died in February 1637, after having witnessed the election and coronation of his son Ferdinand as King of the Romans.

Ferdinand II. reigned in very troubled times; his bigotry and ruthless intolerance were the cause of most of his troubles, but he was not deficient in abilities or perseverance. His connivance at the assassination of his best general Waldstein, whose ambition and arrogance had made him suspected and feared, is an everlasting blot on his memory, but it was only accordant with the general tenor of his character.

FERDINAND III., son of Ferdinand II., had to continue the war against the Swedes, who had been joined by the French, for several years more, until the peace of Westphalia, 1648, put an end to the desolating struggle. This celebrated treaty forms an important epoch in the history of Germany and of Europe. The remainder of the reign of Ferdinand III. was passed in tranquillity. He died in 1657, leaving behind him the character of a prudent, temperate, and a brave prince. He was succeeded by his son, Leopold I.

FERDINAND, or FERNANDO I., styled the Great, the son of Sancho, called Mayor, king of Navarra and Castile, succeeded his father in 1035, and having defeated and killed Veremund, king of Leon, in 1038, succeeded him as king of Leon and of Asturias. Navarra became the appanage of Ferdinand's brother Garcia. Ferdinand, called the Great, made war against the Moors, whom he drove away from the northern part of Portugal as far as the Mondego. He died in 1065, leaving three sons—Sanctius, to whom he gave Castile; Alfonso, who had Leon; and Garcia, who retained Galicia.

FERDINAND II., second son of Alonso VIII. of Castile and Leon, succeeded his father in the latter kingdom only in 1157. He was engaged in wars with Alfonso Henrique, king of Portugal, and also with his own nephew, Alonso of Castile. He died in 1187.

FERDINAND III., called 'the Saint,' son of Alonso IX., king of Leon, and of Berengaria of Castile, inherited both crowns after the death of his parents. Ferdinand was successful in his wars against the Moors beyond any of his predecessors: he took from them Badajoz and Merida in 1230, Cordova in 1236, and Jaen, Seville, and Murcia in 1243. He was making preparations for carrying the war into Africa when he died, in 1252. Ferdinand collected the laws of his predecessors into a code; he established the council of Castile; he cleared his states from robbers, and checked the arbitrary acts of the nobles. He was one of the most illustrious sovereigns of the old Spanish monarchy. His son, Alonso X., called 'the Wise,' succeeded him.

FERDINAND IV. succeeded his father, Sancho IV., in 1295, while yet a minor. His reign was engrossed chiefly by wars with the Moors: he died in 1312, and was succeeded by his son, Alonso XI.

FERDINAND V. of Castile and II. of Aragon, son of John II. of Aragon, married in 1469 Isabella, daughter of John II. of Castile, and heiress to that crown, by whom he had several daughters, one of whom married Emmanuel, king of Portugal; another, Catherine, was married to Henry VIII. of England, and the other, Joanna, married Philip, archduke of Austria, son of the Emperor Maximilian I. Ferdinand succeeded to the crowns of Aragon and of Sicily by the death of his father, and his wife Isabella had already succeeded in her own right, and with the sanction of the Cortes, to the throne of Castile by the death of her brother, Henry IV., in 1472. Thus were the two great divisions of Spain united, though the two kingdoms remained under

separate administrations. Castile was still governed in the name of the queen until the death of Isabella in 1504, followed by that of the Archduke Philip in 1506, when Ferdinand, owing to the insanity of his daughter Joanna, assumed the government of Castile, which he retained till his death, when his grandson, Charles V., succeeded to the whole inheritance.

Ferdinand took from the Moors the kingdom of Granada, their last possession in Spain, in 1492, after a war of several years; at the same time Columbus was discovering for him the New World, where the Spaniards soon after made immense conquests. Ferdinand's general, Gonzalo of Cordova, conquered for him the kingdom of Naples, partly by force, and partly by treachery. By similar means Ferdinand conquered Navarra, which he added to his other dominions. He was the most powerful monarch of his time, and was also the cleverest; but his abilities were disgraced by a total want of faith, and a recklessness of principle of which he made no scruple of boasting. He was styled 'the Catholic'—a title which the kings of Spain have continued to assume ever since, in consequence of his having cleared the soil of Spain of the Mohammedans. He was also called 'the Prudent,' and 'the Wise.' He was ably assisted by his minister, Ximenes [CISNEROS], who emancipated the crown from the power of the feudal nobles by raising troops at the expense of the state, and by favouring the privileges of the municipal towns. Ferdinand established the Inquisition in Spain, which fearful tribunal continued till 1820, when it was finally abolished. Acting from the same intolerant principle, he drove away the Jews from Spain; but he also established a severe system of police throughout his dominions by means of the association called the Santa Hermandad, which did summary justice upon all offenders without distinction of ranks. He also forbade any papal bull to be promulgated without the previous sanction of the royal council. He may be considered as the restorer, if not the founder, of the Spanish monarchy. Ferdinand died in January 1516, at sixty-three years of age.

FERDINAND VI., eldest son of Philip V. of Bourbon, king of Spain, succeeded his father in 1746. He made several useful reforms in the administration, and gave encouragement to commerce and manufactures. He had the character of a good and prudent prince, willing to administer impartial justice, and to redress the grievances of his subjects. He died without issue in August 1759, and was succeeded by his brother Don Carlos, king of the Two Sicilies, who assumed the title of Charles III. of Spain.

FERDINAND VII., eldest son of Charles IV., king of Spain, and of Maria Louisa of Parma, was born on the 14th of October 1784. When six years of age, he was proclaimed Prince of Asturias. At that time Godoy, afterwards called the Prince of Peace, was the favourite minister and ruler at the Spanish court. Both he and the queen kept young Ferdinand, who was of a sickly constitution, in a state of thralldom and seclusion little suited to the heir-apparent of the throne. He had however some well-informed preceptors; among others the canon Escociquiz, who figured afterwards in the political events of his reign. In 1802 Ferdinand married his first cousin, Maria Antonietta, daughter of Ferdinand IV., king of the Two Sicilies, a princess of a superior mind, who endeavoured to restore her husband to his proper sphere and influence at court; in attempting which she drew upon herself the dislike of the queen and of the favourite, and from that time both she and her husband were kept in a state of retirement and humiliation. She died suddenly in May 1806, under suspicious circumstances, and left no issue.

In the meantime the administration of Spain was in a wretched state; everything was done through bribery or favour; the monarchy was sinking lower and lower in the estimation of Europe, having become a mere dependant of France, and the people were highly dissatisfied. Some friends of Ferdinand, and among others his preceptor Escociquiz, formed a plan for overthrowing the favourite Godoy. Being in want of powerful support, they unwarily advised Ferdinand to address himself to the Emperor Napoleon, to whom the prince wrote a letter, dated 11th of October 1807, in which he complained of Godoy's influence and the state of thralldom in which both the king his father and himself were kept, and expressed a desire to form a connection with a princess of Napoleon's family, and to place himself under his protection. A memorial was at the same time penned by Escociquiz, and copied by Ferdinand with his own hand, pointing out in vivid language the mal-administration of the kingdom, and asking, as the first remedy, the dismissal of the favourite. Ferdinand was to have read this memorial to the king his father, but Godoy being apprised of the plot, hastened to Charles, and told him that his son was conspiring both against his crown and his life. Upon this Ferdinand was arrested, his papers were seized, and after some days of close confinement he was frightened into an acknowledgment of what there appears reason to believe he really was innocent—a conspiracy to dethrone his own father. This scandalous affair caused great excitement in the country, and the people in general, who disliked Godoy, took the part of the young prince, who from his infancy had been the victim of court intrigues. Meanwhile French troops had entered Spain under the pretence of marching against Portugal—had taken possession by surprise of several fortresses, and Napoleon's further intentions becoming more alarming, the court decided upon abandoning Spain and retiring to Mexico. The 17th of March 1808 was fixed for the departure, when a revolt broke out

among the guards at Aranjuez, and Godoy was in danger of his life; but Ferdinand himself came to rescue him from the hands of the mutineers, saying that he would answer for his appearance before the proper court. King Charles being alarmed for his own safety, and perceiving the popularity of his son, abdicated on the 19th of March in favour of Ferdinand, who assumed the title of King of Spain and the Indies. But this did not suit Napoleon, who contrived under specious pretences to draw both father and son to Bayonne, and there obliged them both to resign in his favour. Ferdinand and his brother Don Carlos were sent to Talleyrand's country residence at Valençay, where they were treated with outward marks of respect, but kept under a strict watch. There Ferdinand remained passive and resigned till the end of 1813, when the reverses of the French both in Spain and in Germany induced Napoleon to restore Ferdinand to the throne of Spain, on condition that he should send the English out of the peninsula, who were, as Napoleon said, spreading anarchy and jacobinism in the country. A treaty to that effect was signed at Valençay between the two parties, but the Cortes of Madrid refused to ratify it, and wrote to Ferdinand that they would receive him in his capital as their lawful king, provided he would sign the constitution which had been proclaimed at Cadiz in 1812 by the representatives of the nation. Ferdinand set off from Valençay in March 1814, and it was only on the road that he read for the first time a copy of the new constitution, having been kept in ignorance till then of the proceedings of the Cortes, except what he had read in the garbled accounts of the French newspapers. On arriving at the frontiers of Spain, instead of proceeding direct to Madrid, he went to Zaragoza, and thence to Valencia, where he was surrounded by a host of people, military and civilians, churchmen and laymen, who were hostile to the constitution, and who advised him to reign, as his fathers had done before him, an absolute king: advice with which his own inclination fully accorded. The lower classes, excited by the clergy, and especially by the friars, were loud in their denunciations of the constitution, which they called heretical, and Ferdinand easily persuading himself that the constitution was unpopular, determined not to sanction it. At Valencia he appointed a ministry from among the serviles, or absolutists; and on the 4th of May 1814, he issued a decree annulling the constitution and all the enactments of the Cortes made in his absence. Soon afterwards he made his entrance into Madrid among the acclamations of the populace and of the absolutists, or clergy party; an event which was speedily followed by a violent proscription of the constitutionalists, or liberals, as they were styled, including the members of the Cortes. As the British ambassador had obtained from Ferdinand at Valencia a promise that the punishment of death should not be inflicted for past political conduct, the courts appointed to try the leading constitutionalists resorted to every kind of subterfuge in order to find them guilty of some imprudent demonstration or expression since the king's return, and sentences of imprisonment, exile, banishment to the presidios in Africa, and confiscation, were freely awarded. The military insurrections of Porlier, Laca, and others, came to add fresh fuel to the spirit of persecution. All the abuses of the old administrative and judicial system now re-appeared; the finances were in a wretched state, the American colonists were in open revolt. Ferdinand was partly overawed by the clergy and absolutist party, who, at that time, seemed to have on their side the great mass of the population, but he feared and hated the liberals.

On the 1st of January 1820, part of the troops stationed on the Isla of Leon, near Cadiz, under Colonels Quiroga and Riego, proclaimed the constitution of 1812; the example was followed by other garrisons; the ministers at Madrid hesitated, and Ferdinand, on the 9th of March of that year, swore his adherence to the constitution. The Cortes were assembled, and the deputies and other liberals, who had been exiled or imprisoned, re-appeared on the political stage. During the following three years the country was in a thoroughly disorganised condition. At one time Ferdinand appeared reconciled to the constitutional system, but then would occur some opportunity for the display of his old fears and antipathies; whilst, on the other side, the partisans of absolutism, who still lingered near the king's person, kept alive by their intrigues the mistrust even of the moderate constitutionalists. Of this period of Ferdinand's reign there is a sketch in a work written by a Spanish emigrant at Paris, styled '*Revolution d'Espagne, Examen Critique*,' 8vo, 1836, which is worth consulting.

At the beginning of 1823 Louis XVIII. declared to the French chambers that he was going to send his nephew the Duke of Angoulême, with an army of 100,000 Frenchmen into Spain to deliver Ferdinand VII. from the slavery in which he was kept by a factious party, and to restore him to his freedom of action. The English ministry protested against this interference, and the Cortes of Spain, on their side, rejected the mediation of the northern courts, who, to prevent the entrance of the French, required certain modifications in the constitution of 1812. The Cortes, on the 20th of March, removed to Seville, where the king was induced to follow them. On the 7th of April the French entered Spain, with little or no opposition, and on the 23rd they entered Madrid, where they were received with acclamations by the clergy and the lower classes, while the grandes or high nobility presented a congratulatory address to the Duke of Angoulême. The Cortes, not judging themselves safe at Seville

removed to Cadiz, and, as Ferdinand refused to quit Seville, they passed a resolution, after a stormy debate on the 11th of June, declaring the king in a state of incapacity, and appointing a regency pro tempore. Ferdinand was then compelled to set off with his family on the evening of the 12th, under a strong escort, for Cadiz, where he arrived on the 15th. In the following September the French besieged Cadiz, and after some negotiations Ferdinand was allowed by the Cortes to repair to the French camp to treat with the Duke of Angoulême. Before leaving Cadiz Ferdinand published a proclamation on the 30th of September, in which he promised a general amnesty for the past; he acknowledged all the debts and obligations contracted by the constitutional government, and "declared of his own free and spontaneous will that if it should be found necessary to make alterations in the actual political institutions, he would adopt a system of government which should guarantee the security of persons and property and the civil liberty of the Spaniards." None of these solemn promises were kept: nor were they in all probability ever intended to be kept. Ferdinand was one to whom falsehood was habitual, and an oath offered no obstacle. The liberals were persecuted worse than before, the debts contracted under the Cortes were disavowed, and the old system of absolutism with all its mal-administrations was resumed. The sequel is well known. Ferdinand continued to govern, at least nominally, checked on one side by fear of the liberals, and on the other by mistrust of the more violent absolutists, or apostolical party as it was called, who found even Ferdinand too moderate for them, and who would have re-established the Inquisition, and ruled Spain by terror. In his latter years Ferdinand, never of a very active intellect, became more and more lethargic; seemed to take little or no interest in public affairs, and left things to go on as they could. Having lost his third wife, who was a Saxon princess, and having yet no children, he married in November 1820, Maria Christina, daughter of Francis, king of the Two Sicilies, and his own niece by the mother's side [CHRISTINA, MARIA]. By her he had two daughters—Maria Isabella, now queen of Spain, born 10th October 1830, and Maria Louisa Ferdinanda, born 1832. Ferdinand died on the 29th of September 1833, after being long in a bad state of health. He was buried with great pomp in the royal vaults under the chapel of the Escorial.

FERDINAND I. of Naples was the natural son of Alfonso V. of Aragon and of Sicily. His father obtained of the Neapolitan barons in Parliament assembled, in 1442, the acknowledgment of Ferdinand as duke of Calabria and heir to the Crown of Naples, thus securing to his favourite and only son one of his several kingdoms, as Aragon, Sardinia, and Sicily devolved upon John of Aragon, Alfonso's brother. In 1458, after the death of his father, Ferdinand assumed the crown of Naples. Pope Calixtus III. refused him the investiture, which however was granted to him by Pius II., the successor of Calixtus. His reign began well, but a conspiracy of the barons, who called in John of Anjou, who had some remote claim to the throne, threw the country into a civil war. Ferdinand, assisted by Scanderbeg, prince of Albania, gave battle to John near Troja, in Apulia, and defeated him completely, in the year 1462. After the battle he concluded a peace with the revolted barons upon conciliatory terms; but in a short time, breaking the treaty, he put to death two of them, an act which kept alive the jealousy and fears of the rest. In 1480, Mohammed II. sent an armament on the coast of Apulia, which took the town of Otranto, and caused great alarm in all Italy. Ferdinand, however, quickly recalled his son Alfonso, duke of Calabria, who was then in Tuscany at the head of an army, and who retook Otranto. A fresh conspiracy of the barons broke out, encouraged by Pope Innocent VIII., but it was again repressed, and Ferdinand solemnly promised a general amnesty. But he kept his word no better than before; for having contrived, on the occasion of the marriage of his niece, to collect at Naples most of the leading barons, he arrested them all, and threw them into prison, where most of them were strangled. The whole of this tragedy, which was attended by circumstances of fearful treachery and cruelty, is eloquently related by Porzio, in his work, '*La Congiura dei Baroni contra il Re Ferdinando I.*' Ferdinand continued to reign for several years after this, feared and hated by his subjects, and himself in perpetual anxiety, which was increased by the advance of Charles VIII. of France, who was coming for the purpose of asserting his claims, derived from the Anjous, to the throne of Naples. In the midst of the alarm at the approaching storm, which he had not the means of averting, Ferdinand died in 1494, at the age of 71. He was succeeded by his son Alfonso, a gloomy and cruel prince, who, terrified at the approach of the French, abdicated in favour of his son Ferdinand, and retired to a convent in Sicily.

FERDINAND II. was very young when he found himself occupying a throne threatened by enemies from without and by disaffection from within. He endeavoured to rally his troops against the French, but being forsaken by all, he withdrew to Sicily with his uncle Frederic. The French occupied Naples, where their conduct soon disgusted the Neapolitans, while the other states of Italy formed a league against them in the North. Ferdinand seized the opportunity to ask assistance from Ferdinand V. of Spain, who sent him his great Captain Gonzalo of Cordova, with a body of troops, who soon reconquered the kingdom of Naples. Ferdinand returned in triumph to

his capital, but did not long enjoy his prosperity; he died suddenly in 1496, at the age of 28 years, regretted by his subjects, who had formed great hopes of him from his amiable qualities and abilities. He was succeeded by his uncle Frederic, who was soon after treacherously deprived of his kingdom by his pretended ally, Ferdinand of Spain.

FERDINAND IV. of Naples, afterwards styled Ferdinand I. of the United Kingdom of the Two Sicilies, born in January 1751, was the son of Don Carlos of Bourbon, king of the Two Sicilies, afterwards Charles III. of Spain. The life of Ferdinand is remarkable, not so much on account of his personal character, as from the uncommon length of his reign and its many vicissitudes being closely connected with all the great events of Europe during the last half century, as well as the singular good fortune which attended him to the end of his life with little or no exertion on his part. The education of Ferdinand was greatly neglected. He was little more than eight years of age when his father Charles, being called to the throne of Spain by the death of his brother Ferdinand VI., made over to him the kingdom of Naples and Sicily, appointing a council of regency, at the head of which he placed the Marquis Tanucci, an able minister, who however does not seem to have been very anxious about the instruction of his young sovereign. In April 1768 Ferdinand, being now of age, married Maria Carolina of Austria, daughter of Maria Theresa, a princess accomplished, clever, and ambitious, who in fact ruled under her husband's name till her death, assisted by the various ministers who succeeded each other at the helm of affairs, the king himself being generally passive, and his time being much engrossed by hunting, shooting, and other diversions. Yet Ferdinand was by no means deficient in natural penetration; he often saw things more clearly than those around him, as is manifest from many of his shrewd though blunt remarks which are still remembered at Naples; but his want of instruction, of which he was aware, and his dislike of application, prevented him from exerting or enforcing his own judgment. The first thirty years of his reign, those of the regency included, were for Naples years of peace and comparative happiness; many useful reforms were effected by his ministers, and especially by Tanucci, who continued at the head of affairs till 1777. (See Colletta, *Storia del Reame di Napoli*, 1834, and also Count Orloff in the second volume of his *Mémoires sur le Royaume de Naples*.) Ferdinand was popular with the lower classes; and as he was the first king born at Naples for centuries past, they called him emphatically 'our king.'

Tanucci being dismissed in 1777 for having objected to the queen taking her seat in the council of state, Caracciolo and others followed for a short time, until John Acton, an Englishman, and a naval officer in the service of Leopold of Tuscany, was sent for to organise the Neapolitan navy and army, which had fallen into decline during a long season of peace. The advancement of Acton was extremely rapid; he was made general, then captain-general of the kingdom, and lastly premier, or rather sole minister (for the other ministers were merely his creatures), and in this office he remained for many years. His administration was neither so economical nor so wise as that of Tanucci. Things went on however quietly and smoothly for several years. A considerable degree of liberty of speech, and even of the press, prevailed at Naples, and the country was prosperous and the people contented until the breaking out of the French revolution, of which Naples, however remote, felt the shock. The queen being the sister of Marie Antoinette, was indignant at the treatment her relatives of France met with at the hands of the revolutionists; and as many young men at Naples, mostly belonging to the higher ranks of society, seemed to approve of the principles of the revolution, the court took alarm, and the men who had always been averse to reform and improvement seized the opportunity to regain the ascendancy. Arrests were made, and a giunta, or state tribunal, was formed to try the real or pretended conspirators, three of whom were sentenced to death, others to perpetual imprisonment, but the majority (against whom the judges, notwithstanding all the exertions of the attorney-general, Vanni, could find no evidence), were acquitted after four years' confinement.

The court of Naples had joined the first coalition against France in 1792, and had sent some troops to join the Austrians in the North of Italy, and others with a squadron to the expedition against Toulon. In 1796 however, alarmed by the successes of Napoleon I., a peace was purchased of the Directory by paying a few millions of francs. In 1798, the French having occupied the papal state, the court of Naples formed a secret alliance with Austria, England, and Russia, but, instead of waiting for the opening of the campaign in Lombardy, which was to take place in the following spring, the Neapolitan army, 60,000 strong, began hostilities in November 1798, and marched upon Rome, which it occupied only for a few days, as the French generals, having collected their forces, attacked and routed several divisions of the Neapolitans, and cut off the communications between the rest; a general panic spread through the army; the king, who had accompanied it as far as Rome, fled back to Naples; Mack, who was his commander-in-chief, followed his example; and of the various corps that were left to themselves without any concerted plan or preparations in case of a reverse, some were dispersed or made prisoners, and others made good their retreat to their own frontiers, whither the French followed them closely. The greatest confusion prevailed at

the court of Naples; the queen, beset by informers, fancied that the capital was full of conspirators, and determined to withdraw to Sicily. Ferdinand was easily persuaded to do the same, and the royal family left Naples on the 21st of December 1798. The French meantime were approaching, and the populace, left without a government and excited by denunciations against the Jacobins, rose, murdered a number of persons, and for three days fought desperately against the advancing French in the streets of the capital. The events of Naples in 1799 form a romantic but tragical episode in the history of the Continental war, and they have become the theme of numerous narratives. The reverses of the French in Lombardy in the spring of 1799, obliged them to abandon Naples, leaving only a small garrison in it. The native republicans, or patriots as they were called, were few, and disliked by the lower classes. Cardinal Ruffo landed in Calabria from Sicily, and preached a sort of political and religious crusade against the French and their partisans, and the whole kingdom was reconquered for Ferdinand in a short time. A dreadful reaction took place, in which thousands lost their lives, either murdered by the royalists, or condemned by the courts instituted to try all those who were accused of republicanism.

Ferdinand returned to Naples, and in 1801 he concluded, through the mediation of Russia, a treaty of peace with France. But the past events and the proscriptions that had taken place in his name had destroyed all confidence between the government and the more enlightened part of the nation. In 1805 the court of Naples committed a second political error, worse than that of 1798. While professing to be at peace with France, it entered secretly into the coalition against that power; and while Napoleon was defeating the Austrians on the Danube, Russian and English troops were landed at Naples to join the army of that kingdom for the avowed purpose of attacking the French in the north of Italy. The consequence was, that Napoleon, after his victory at Austerlitz, declared that "the Bourbon dynasty had ceased to reign at Naples," and he sent a force under Massena to occupy that kingdom. Ferdinand and his court withdrew to Sicily a second time, where being protected by the English forces, they remained till 1815. A desultory but cruel warfare was carried on for several years in Calabria between the partisans of Ferdinand and those of Murat, whom Napoleon had made King of Naples, the details of which are vividly described by Botta, *Storia d'Italia*, twenty-fourth book, towards the end. But even in Sicily the reign of Ferdinand did not run smooth. The court was extravagant in its expenditure, the queen was as arbitrary as ever, and great jealousy existed between the Sicilians and the Neapolitan courtiers and emigrants. But Sicily had a parliament consisting of three orders, barons, clergy, and deputies of the towns, and the parliament would not sanction the levying of fresh taxes. The queen then ordered the imprisonment of five of the most influential barons. Meantime it was suspected that that princess, who had conceived a dislike against the English, whom she considered as a check upon her, entertained secret communications with Napoleon, who in 1810 had married her grand-niece Maria Louisa. A conspiracy against the English was discovered at Messina. All these circumstances obliged the English government to interfere, and in January 1812 Ferdinand resigned his authority into the hands of his eldest son, Francis. A parliament was assembled, which abolished feudality, and framed a new constitution upon a liberal basis. The queen's influence was now at an end, and after some fruitless intrigues she embarked in 1813 for Constantinople, from whence she went to Vienna, where she died in the following year. For an account of these important Sicilian transactions see Botta, and also a work styled *De la Sicile et de ses Rapports avec l'Angleterre à l'époque de la Constitution de 1812*, Paris, 1827. In 1814 Ferdinand resumed the reins of government, and opened in person the Sicilian parliament of that year. In 1815, after the defeat of Joachim Murat by the Austrians, Ferdinand was recalled to the throne of Naples, and in June of that year he returned to his old capital. In a well-written proclamation to the Neapolitans he promised them peace, a complete forgetfulness of the past, impartial justice, and a steady administration; and to a great extent he kept his word. The government of Ferdinand at Naples from 1815 till 1820 was comparatively mild, impartial, and orderly. But in Sicily, having dissolved the parliament, he never convoked it afterwards. By a decree of December 1816, he assumed the title of Ferdinand I., King of the United Kingdom of the Two Sicilies, declaring that Sicily and Naples formed no longer distinct states, but were both subject to the same system of government.

Meantime a secret society, called Carbonari, were spreading themselves fast through the kingdom, especially among the landed proprietors in the provinces, and consequently through the ranks of the provincial militia. The land-tax, which was more than 20 per cent. on the rent, made this class of people dissatisfied and ready for change. The origin of this society or sect, for it was religious as well as political, is somewhat obscure: it seems to have come from France into Italy, and was established in the kingdom of Naples under Murat, with his sanction; but was afterwards proscribed by him, and it then found favour with the court of Sicily. On the 2nd of July 1820, a military revolt, led by two subalterns, broke out in a regiment of cavalry stationed near Naples; other troops joined in it, and the Carbonari of the capital and provinces openly espoused its cause, demand-

ing a representative constitution for the kingdom. Ferdinand, pressed by his ministers, promised to establish a constitution in a given time; but the Carbonari would not wait, saying it was better to adopt one already made, namely, that of the Cortes of Spain; and thus the Spanish constitution was proclaimed, and a parliament was convoked at Naples. Meantime the Sicilians, ever jealous of their nationality, demanded a separate parliament for themselves, and a repeal of the union of the two kingdoms, which the parliament at Naples refusing, a revolt broke out at Palermo, which was put down after much bloodshed. Soon after, the sovereigns of Austria, Russia, and Prussia, assembled at Troppau, wrote to King Ferdinand, inviting him to a conference at Laybach, in Carinthia, without which they stated that they could not acknowledge the new system of government established at Naples. Ferdinand, after some demur, obtained leave of the parliament to proceed to the congress in December 1820, leaving his son, Francis, as his viceroy at Naples. In February 1821, Ferdinand, by a letter written from Laybach, signified to his son that the allied sovereigns were determined not to acknowledge the actual constitutional government as established at Naples, deeming it incompatible with the peace of that country and the security of the neighbouring states; but that they wished Ferdinand himself, assisted by the wisest and most able among his subjects, to give to his kingdom institutions calculated to secure peace and prosperity to the country. Soon afterwards the Austrian army passed the Po, moving on towards Naples. The parliament of Naples determined upon resistance, but at the first encounter, near Rieti, a Neapolitan division was defeated; the rest of the army being alarmed at the thought of fighting against the will of their own king, disbanded, and the Austrians entered Naples without any further opposition, at the end of March 1821. Ferdinand soon afterwards returned to his capital on what may be styled his third restoration. The leading constitutionalists were allowed to emigrate; but of those who remained some were tried and sent to the Presidii. The government again became absolute; and—Ferdinand now having his dread of the constitutionalists pretty well removed—not so lenient or liberal as it was before 1820. After reigning four years longer, Ferdinand died suddenly on the morning of the 4th of January 1825, aged seventy-six, having been king sixty-five years. He was succeeded by his son, Francis I.

FERDUSI. [FERDUSI.]

FERGUSON, ADAM, born in 1724, was the son of a parish minister in Perthshire. He studied at St. Andrews and at Edinburgh, with a view to the Christian ministry. On being ordained, he was appointed chaplain to the 42nd, a Highland regiment, in which he remained till 1757, when he retired, and was appointed keeper of the advocates' library of Edinburgh. In 1759 he was made professor of natural philosophy in the college of that city, and in 1764 he was appointed to the chair of moral philosophy, a branch of science to which he had more particularly applied himself. In 1767 he published his 'Essay on the History of Civil Society,' a work which was well received, and which procured him the notice of public men. It was reprinted several times, and translated into the French, German, and Swedish languages. In 1774 he accompanied the young Earl of Chesterfield on his travels, but remained with him only a twelvemonth. In 1776 he wrote 'Remarks on a Pamphlet of Dr. Price, entitled Observations on the Nature of Civil Liberty.' In 1778 he was appointed secretary to the commissioners who were sent to America in order to try to effect a reconciliation with the mother country, an office in which Ferguson took a clearer view of the state of the question, and of the temper of the American people, than was common at that time with Englishmen. On his return in 1779 he resumed the duties of his professorship, and in 1783 he published his 'History of the Progress and the Termination of the Roman Republic,' 3 vols. 4to. This work, which has been reprinted several times, and by which Ferguson is most generally known, is not so much a regular narrative of the events of Roman history, as a commentary on that history; its object is to elucidate the progress and changes of the internal policy of the Roman commonwealth, the successive conditions of its social state, as well as the progress of the military system of the Romans, and the varied but studied course of their external policy towards foreign nations. He carries his work down to the end of the reign of Tiberius, when all remains of the old institutions may be said to have become effaced. Ferguson's work forms therefore a kind of introduction to that of Gibbon on the decline and fall of the empire. Ferguson and his contemporary, the French Abbé Auger, were foremost among those who, previous to Niebuhr, investigated the internal working of the institutions of the Roman republic. [AUGER]. In 1784 Ferguson resigned his professorship on account of ill health, and was succeeded by Dugald Stewart. In 1792 he published 'Principles of Moral and Political Science,' being chiefly a retrospect of lectures on ethics and politics, delivered in the College of Edinburgh, 2 vols. 4to. Another work of Dr. Ferguson on the same subject, though a more elementary one, the 'Institutes of Moral Philosophy,' which he first published in 1769, has been translated into the French and German languages, and often reprinted. Ferguson died at St. Andrews in February 1816, being above ninety years of age. He had been on terms of friendship with Hume, Robertson, Adam Smith, Dugald Stewart, Playfair, and other distinguished contemporaries.

FERGUSON, JAMES, was born in 1710, at a short distance from

Keith, a village in Banffshire. His father, who was a day-labourer, taught him to read and write, and sent him to school for three months at Keith.

When only seven or eight years old, having seen his father use a beam as a lever, with a prop for a fulcrum, in order to raise the roof of their cottage, which had partly fallen in, his curiosity was so much excited by the ease with which what appeared to him so stupendous an effect was accomplished, that he thought about it, and made trials, and constructed models, and drew diagrams, till he became acquainted with the chief properties of the lever, not only in its simple application, but as modified by the wheel and axle. The taste for practical mechanics thus formed continued to distinguish him through life, and, together with an equally decided taste for astronomy, conducted him in his later years to distinction and independence.

His astronomical pursuits commenced soon afterwards. His father sent him to a neighbouring farmer, who employed him in watching his sheep. While thus occupied, he amused himself at night in studying the stars, and during the day in making models of mills, spinning-wheels, and similar things. When a little older, he entered into the service of another farmer, who treated him with great kindness, and encouraged and assisted him in his astronomical studies. "I used," he says, "to stretch a thread with small beads on it at arm's length between my eye and the stars, sliding the beads upon it till they hid such and such stars from my eye, in order to take their apparent distances from one another; and then laying the thread down on a paper, I marked the stars thereon by the beads." "My master," he adds, "that I might make fair copies in the day-time of what I had done in the night, often worked for me himself." Mr. Gilchrist, the minister of Keith, having seen his drawings, gave him a map of the earth to copy, and furnished him with compasses, ruler, pens, ink, and paper.

At the house of Mr. Gilchrist he met Mr. Grant of Achoyne, with whom, at the termination of his engagement with his present master, he went to reside, being then in his twentieth year. He had learnt vulgar arithmetic from books, and Mr. Grant's butler, Mr. Cantley, taught him decimal arithmetic and the elements of algebra, and was about to commence instructing him in geometry when he left the employment of that gentleman.

Ferguson soon afterwards entered into the service of a miller in the neighbourhood, where he was overworked, and scarcely supplied with food enough for subsistence. After remaining a year in this situation, he was engaged by Dr. Young, who was a farmer as well as a physician, and who promised to instruct him in medicine, but broke his promise, and treated him with so much harshness that, though his engagement was for half a year, he left at the quarter, and forfeited the wages which were due to him. A severe hurt of the arm and hand, which he had got in the doctor's service, confined him to his bed for two months after his return home. During this time he amused himself with constructing a wooden clock. He afterwards made a wooden watch with a whalebone spring; and his talents having been turned in this direction, he began to earn a little money in the neighbourhood by cleaning and mending clocks.

He was about this time invited to reside with Sir James Dunbar of Durn, and, at the suggestion of Lady Dipple, Sir James's sister, began to draw patterns for ladies' dresses. He says, "I was sent for by other ladies in the country, and began to think myself growing rich by the money I got by such drawings; out of which I had the pleasure of occasionally supplying the wants of my poor father." His studies in astronomy however were not neglected, and he still continued to use his thread and beads.

Besides drawing patterns, he copied pictures and prints with pen and ink; and having left the residence of Sir James Dunbar for that of Mr. Baird of Auchmeddan, Lady Dipple's son-in-law, he drew a portrait of that gentleman which was much admired, and now began to draw likenesses from the life in Indian ink. These appeared to his patrons to be so excellent, that they took him to Edinburgh with the intention of having him regularly instructed in drawing, but a premium having been unexpectedly demanded, he boldly commenced the practice of his art at once. The Marchioness of Douglas having assisted him with her patronage, he succeeded so well that he obtained money enough, not only to defray his own expenses, but to contribute largely to the support of his aged parents.

Though he continued to follow this profession for about twenty-six years, he seems never to have given his mind to it; and indeed, after having been two years in Edinburgh, he returned to the country with a supply of drugs with the intention of practising medicine, but soon found himself to be totally unqualified for his new occupation. He then went to Inverness, where he remained about three months. While there he drew an Astronomical Rotula, for exhibiting the eclipses of the sun and moon, which he transmitted to Professor MacLaurin at Edinburgh, who was highly pleased with it. He now returned to Edinburgh, and the Professor had the 'Rotula' engraved, and it ran through several impressions, till, by the change of the style in 1753, it became useless. While at Edinburgh he made a wooden orrery, and delivered a lecture on it before the mathematical class.

In 1743 he resolved to go to London, where he continued his profession of drawing portraits, but devoted his leisure to astronomical pursuits.

In 1747 he published his first work, 'A Dissertation on the Phenomena of the Harvest Moon,' having been previously introduced at one of the sittings of the Royal Society by Mr. Folkes the president.

In 1748 he read lectures on the eclipses of the sun which happened in that year. From this period he began, under the patronage of the Prince of Wales (afterwards George III.), to deliver lectures on astronomy and mechanics; they were numerous and fashionably attended, and he now relinquished his former profession altogether. From this time to the end of his life he continued his lectures, and wrote several works on astronomy and mechanics.

Soon after the accession of George III. a pension of 50*l.* a year was granted him out of the privy purse. In 1763 he was elected a Fellow of the Royal Society, and in 1770 was chosen a member of the American Philosophical Society.

He died in 1776, aged sixty-six, leaving an only son, to whom he bequeathed a considerable sum acquired by his lectures and his writings.

Ferguson has contributed more than perhaps any other man in this country to the extension of physical science among all classes of society, but especially among that largest class whose circumstances preclude them from a regular course of scientific instruction. Perspicuity in the selection and arrangement of his facts, and in the display of the truths deduced from them, was his characteristic both as a lecturer and a writer.

The following are his principal works:—'*Astronomy explained upon Sir Isaac Newton's Principles, and made easy to those who have not studied Mathematics*,' 4*to*, 1756. There have been many editions of this work; one by Dr. (now Sir David) Brewster, 2 vols. 8*vo*, 1811, containing the new discoveries since the time of Ferguson. '*Lectures on Subjects in Mechanics, Hydrostatics, Pneumatics, and Optics, with the Use of the Globes, the Art of Dialling, and the Calculation of the Mean Times of New and Full Moons and Eclipses*,' 8*vo*, 1760; 4*to*, 1764. An edition of this work by Dr. Brewster was published in 1805, and another in 1806. '*An Easy Introduction to Astronomy for Young Gentlemen and Ladies*,' 1769. '*Introduction to Electricity*,' 8*vo*, 1770. '*The Art of Drawing in Perspective made easy to those who have no previous knowledge of Mathematics*,' 8*vo*, 1775: this was his last work. Besides other works not mentioned here, he contributed several papers to the '*Philosophical Transactions*.'

(*Life* by himself, prefixed to his '*Select Mechanical Exercises*;' *Nichols's Anecdotes*; *Cruik, Pursuit of Knowledge under Difficulties*, vol. i.)

FERGUSON, or FERGUSON, ROBERT, was born at Edinburgh about 1750, and educated at the University of St. Andrews, where he received some encouragement from one of the professors named Wilkie, who employed him to transcribe his lectures. An anonymous biographer (*Life* prefixed to Ferguson's *Poems*, edition of 1807) has employed considerable research in discovering certain freaks of a kind neither ludicrous nor in good taste, in which he appears to have indulged during his residence at St. Andrews: one of these was near being the cause of his expulsion; but the sentence was recalled, and he remained as it appears for four years, during which time he subsisted on a bursary or exhibition founded by a person of his own name. On leaving St. Andrew's, he paid a visit to an uncle from whom he had expectations of employment, but after a few months left his house under circumstances of which his anonymous biographer gives a very unsatisfactory account. During the remainder of his life he was employed in the office of the commissary-clerk of Edinburgh, with the exception of a few months spent in that of the sheriff-clerk; and was a constant contributor to Ruddiman's '*Weekly Magazine*,' from which his poems were afterwards collected. The local celebrity which these productions obtained for him gave him so frequent opportunities of convivial and other excess, as to ruin his health, and terminate his life at the early age of twenty-four years. His last days were passed in a mad-house, his debauchery having ended in repentance which took the form of melancholy, when a serious accident having caused the fracture of his skull, his mental faculties became wholly deranged, and he died October 16, 1774, aged only twenty-four.

Ferguson's poems are written partly in English and partly in Lowland Scotch. Those in Lowland Scotch have been admired by persons conversant with the idiom in which they are written; but to an English ear they want the charm which makes Burns pleasing even when he is scarcely intelligible. In praise of his English verses, a little more may be said; but we suspect that the painful circumstances of his life created an interest about him to which much, if not most, of his celebrity is owing.

•FERGUSON, JAMES, architect, author of several valuable works on architecture and collateral subjects, was born at Ayr, Scotland, in the year 1808, and received his chief education at the High School at Edinburgh. Being destined for mercantile pursuits, he spent two years in Holland, and a like period in a counting house in London, and in 1829 he proceeded to India. His first occupation there was as an indigo planter at Jemore; and he was afterwards managing partner of a large firm in Calcutta. After a residence of ten years in India, he had realised sufficient to enable him to return to England in 1839. During the period of his absence he had made a visit to China, and travelled through the principal districts of India.

On his return to Europe he devoted himself wholly to literary and scientific pursuits. His first publication was a description of the Rock Cut Temples of India, with which appeared a folio volume of plates. A second folio volume was published in 1847-48, and entitled '*Picturesque Illustrations of Ancient Architecture in Hindostan*.' In 1847 also appeared '*An Essay on the Ancient Topography of Jerusalem*,' which chiefly relates to the building known as the Mosque of Omar, of which Messrs. Arundale, Bonomi, and Catherwood had then recently succeeded in producing the first authentic delineations, and which are engraved in the '*Essay*.' Mr. Ferguson, judging from the character of the architecture, and the occurrence of what appeared to be a hewn sepulchre, argued that the '*Mosque*' was the church of the Holy Sepulchre. The arguments however have not been generally admitted. In 1849 he published the first volume of '*An Historical Inquiry into the true principles of Beauty in Art, more especially with reference to Architecture*,' a work which exhibits high reasoning powers, and the application of previous theories to the special subject of architecture. The historical part contains suggestions as to structural and decorative arrangements in certain old examples, about which difficulty had been felt by students. The work was originally intended to form three volumes. The materials for the completion of the work were however reserved, and incorporated in the author's recently published '*Illustrated Handbook of Architecture*.' Mr. Ferguson also published in 1849 some '*Observations on the British Museum, National Gallery, and National Record Office, with suggestions for their improvement*,' and somewhere about the same time exhibited a design for the improvement of the National Gallery. His peculiar and accurate knowledge of the Eastern styles of architecture, led him at once to take great interest in the discoveries at Nineveh by Mr. Layard and others; and whilst these were still proceeding, he conceived an ideal restoration of the buildings then in progress of excavation, together with those of Persepolis. These conclusions were given to the world in '*The Palaces of Nineveh and Persepolis restored*,' an essay on Ancient Assyrian and Persian architecture, an illustrated volume published in 1851; and are now pretty generally understood from the Assyrian Court at the Crystal Palace which was planned and decorated under Mr. Ferguson's superintendence.

In the course of his researches in India, Mr. Ferguson had examined some of the earthwork fortifications raised by native races; and having been led to pay much attention to fortification, he broached in 1849 an entirely new system, which he described in a published essay, and illustrated at the Exhibition of 1851 by a model; and he afterwards issued '*The Peril of Portsmouth, or French Fleets and English Forts*,' which has gone through three editions. His theory aimed at the entire subversion of the approved systems of military engineers, preferred circular forms to angles and bastions; and, in contradistinction to the theory that the chances of success in the case of an invested fortification were necessarily in favour of the attack, he maintained the possibility of reversing the condition of affairs so as to place the advantage on the side of the defence. Doing away with the old revêtements as useless and even prejudicial, and substituting earthwork for masonry, he showed how guns might be placed on terraces, so as to allow a considerable number to be brought into use at once, and, as he thought, to keep, as before stated, the superiority at any menaced point with the besieged; and, in spite of the disadvantage of earthworks, that they must stand at slopes. These views were stoutly combated at meetings in the United Service Institution and in print, and the author's demonstrations were indeed ridiculed; but on the occasion of the long defence of Sebastopol, a town provided with the requisite large supply of cannon and matériel, and where earthworks and some contrivances which had been suggested by Mr. Ferguson were skillfully applied, the subject came more prominently before the public. Mr. Ferguson about the same time directed attention to what he deemed the malformation of some of the forts lately erected on the coast of Hants. This produced a further controversy, in the course of which he has lately issued a sequel to '*The Peril of Portsmouth*,' entitled '*Portsmouth Protected*,' with notes on Sebastopol and on other sieges during the war, which he considered supplied evidence of the truth of his theory. Mr. Ferguson's present employment is that of general manager to the Crystal Palace at Sydenham. His library and other parts of the interior of his house in Langham-place, in their fittings and decorations, deserve notice here as amongst the best of recent efforts in their department of practical architecture.

FERISHTA, MOHAMMED KASIM, a celebrated Persian historian, was born at Astrabad, on the border of the Caspian Sea, in 1570. His father, whose name was Gholam Ali Hindoo Shah, and who appears to have been a learned man, left his native country when Ferishta was very young and travelled into India. He finally settled at Ahmudnugger, in the Deccan, during the reign of Murtuza Nizam Shah, and was appointed to instruct Miran Hossein, the son of Murtuza, in the Persian language, but he died soon after this appointment. Miran Hossein however patronised his son Ferishta, and through his influence the historian was advanced to high honours in the court. When Murtuza was assassinated, Ferishta, who was then only seventeen years of age, was captain of the royal guard.

In the troubles following the death of Murtuza, Ferishta left Ahmudnugger (1589, see the preface to his history), and went to

Bejapore, where he was kindly received by the regent and minister, Dilawur Khan, who introduced him to Ibrahim Adil Shah II, the reigning monarch. In this court he spent the remainder of his life in high honour, engaged sometimes in military expeditions, as we learn from his own history, and devoting his leisure time to the composition of his great work. He died, in all probability, soon after 1611, at the age of forty-one. He mentions in his history the English and Portuguese factories at Surat, 1611.

The preceding account has been chiefly taken from the English translation of *Ferishta*, by Colonel Briggs, which was published in London, in 1829, 4 vols. 8vo. Portions of the history had been previously translated. Colonel Dow published a translation of the first two books in his 'History of Hindostan,' 2 vols. 4to, London, 1768, which is not considered to be very accurately done. A much better translation of the third book was given by Mr. Jonathan Scott in his 'History of the Deccan,' 2 vols. 4to, 1794. Mr. Stewart, in his 'Descriptive Catalogue of the Library of the late Tippecoo Sultan of Mysore,' gives an account of the contents of the history, p. 12; and also a translation of part of the tenth book, accompanied with the original Persian, pp. 259-267.

The history of *Ferishta* is divided into twelve books, with an introduction, which gives a brief and imperfect account of Hindoo history before the time of the Mohammedans, and also a short account of the conquests of the Arabs in their progress from Arabia to Hindustan. The first book contains an account of the kings of Ghizni and Lahore, 997-1186. Here the detailed portion of his history begins: 2, 'The kings of Delhi, 1205 to the death of Akber, 1605;' 3, 'The kings of the Deccan, 1347-1596;' 4, 'The kings of Guzerat;' 5, 'The kings of Malwa;' 6, 'The kings of Kandeish;' 7, 'The kings of Bengal and Behar;' 8, 'The kings of Multan;' 9, 'The rulers of Sind;' 10, 'The kings of Cashmir;' 11, 'An Account of Malabar;' 12, 'An Account of the European Settlers in Hindostan.' At the conclusion of the work, *Ferishta* gives a short account of the geography, climate, and other physical circumstances of Hindustan.

Ferishta is certainly one of the most trustworthy, impartial, and unprejudiced of oriental historians. He seems to have taken great pains in consulting authorities. At the close of his preface he gives a list of thirty-five historians to whom he refers, and Colonel Briggs mentions the names of twenty more who are quoted in the course of the work.

FERMAT, PIERRE DE, was born at Toulouse, about 1595, and was brought up to the profession of the law. We have but few incidents of his private life, except that he became a counsellor of the parliament of his native town, was universally respected for his talents, and lived to the age of seventy years. His works were published in 1670 and 1679, in folio: the last volume contains his correspondence, besides some original scientific papers.

Fermat restored two books of Apollonius, and published Diophantus, with a commentary. The whole of the actual works of Fermat fill an exceedingly small space; nevertheless they contain the germs of analytical principles which have since come to maturity. In fact they may be regarded, generally speaking, as announcements of the results to which he had arrived, without demonstrations, or any indications of the processes employed.

The properties of numbers were the subject of his enthusiastic researches, and no single individual has added more that is both curious and useful to this branch of mathematics than Fermat: the theorem now commonly called Fermat's is but a particular case of a much more general one given in his works.

His method for finding Maxima and Minima has only the merit of a moderate ingenuity, before the differential calculus was discovered; the analysts of that day hovered on the brink of that beautiful process of analysis which has been rather ridiculously termed the greatest discovery of the human mind. A method not very remote from Fermat's was practised by other analysts of his day; and in spirit also by the ancient geometers; but it certainly is not the differential calculus, and Laplace has no ground for his attempt to snatch from the claims of the English and German nations this grand step of analysis in order to appropriate it to his own.

In Fermat's correspondence with Father Mersenne, we find him, in a bungling manner, contesting with Roberval the first principles of mechanics, and maintaining that the weight of bodies is least at the surface of the earth, increasing both within and without, which is the direct opposite to the truth; and in one of his letters, when greeted by Mersenne with the retraction of his errors, he very disingenuously attempts to deny them, asserting that no body has a centre of gravity, with many similar trifles, which place in bold relief the immortal discovery of Sir Isaac Newton of the law of universal attraction, and add lustre to his predecessor Galileo, who escaped from similar paradoxes, from which common sense ought to have guarded both Fermat and Descartes.

The correspondence of Fermat is sufficiently replenished with vanity, which was also well fed by some of his compatriots, who lauded his propositions as the finest things which had ever been discovered. But it is justly suspected that the discovery of many of his properties of numbers was effected by a tentative process, he himself possessing no demonstration, as no vestige remains in the works

published by his son of any peculiar analysis for arriving at them; while there are abundant proofs that he and Frenicle, a young Parisian, employed the methods of tabulation and trial, to suggest properties, and by further trials observe if they could generalise them. In a subject less barren than the theory of numbers this talent and industry would have produced more useful results; for what are the theorems of Fermat to the laws of Kepler?

Fermat conjectured that the path of light, in passing from air to a denser medium, ought to be such as to describe the shortest possible course. This is a particular case of the principle of least action, and requires some remark. First, we see that Fermat's method for finding maxima and minima was not the differential calculus, for though importuned from various quarters to try this principle he was deterred, as he says himself, for two or three years, by the dread of the asymmetries of the process, though any tyro acquainted with the first principles of the differential calculus, with the proper data given, would now do it in five minutes: when Fermat at last did this, it was in a geometrical manner. Secondly, during the life of Descartes, he seems to have disbelieved this law of refraction. The foundations of both their reasonings in natural philosophy were of the slenderest description, if indeed we can at all use such a term as reasoning to the methods of Descartes, whose followers had the greatest faith when he employed the least of that useful faculty. But the law is truly attributable to Snellius, and, though this is well known, many French writers still ridiculously talk of the Cartesian law of refraction. Thirdly, Fermat did not attribute the truth of the principle to any mechanical laws, of which he seems to have known nothing, but to the pseudo-physical principle that nature should take the shortest course in performing its operations—for which indeed he was subjected to several cases of objection, to which he has given good answers, considering the position in which such an hypothesis placed him.

To give a more exact idea of the 'man,' we shall give one of his problems, entitled 'Problem by P. de Fermat. To Wallis, or any other mathematician that England may contain, I propose this problem to be resolved by them.'

'To find a cube number which, added to its aliquot parts, will give a square number? Example 343.

'If Wallis and no English mathematician can solve this, nor any analyst of Belgic or Celtic Gaul, then an analyst of Narbonne will solve it.'

Wallis gives an account of this in the '*Commercium Epistolicum*,' the correspondence having been conducted through Sir Kenelm Digby. The works of Fermat contain also the tangents to some known curves, and some centres of gravity.

Though thus strongly endowed with the faculty of self-esteem, and of that cunning which seeks to hide the tracks of discovery, we must still place Fermat among such men as Pascal, Barrow, Brouncker, Wallis; but he had none of the masculine mind of Descartes, nor a particle of the penetrating spirit of the glory of his age and nation, Newton.

It would be wrong to omit here the most curious of the theorems of Fermat relative to numbers. To make it more generally intelligible we may state, that a triangular number means the sum of any number of terms from the first of the natural numbers 1, 2, 3, 4, 5, &c.; thus 1, 3, 6, 10, &c., are triangular numbers; the square numbers are 1, 4, 9, 16, &c., and are the sums of the progression 1, 3, 5, 7, &c.; pentagonal numbers in like manner are the sums of the numbers 1, 4, 7, 10, &c., namely, 1, 5, 12, 22, &c. The theorem consists in this, that 'every number' is the sum of 1, 2, or 3 triangular numbers; every number is the sum of 1, 2, 3, or 4 square numbers, and so on. In the works of Euler, Legendre, and Barlow, the demonstration of the first two cases may be found; and though Legendre and Cauchy have both laboured to prove it more generally, yet our impression is that the general theorem is still without proof.

FERNANDEZ, DENIS, a Portuguese navigator, who, in 1446, discovered the river Senegal and Cape Verde.

FERNANDEZ, JOAN, a Portuguese, the first European who visited the interior of Africa: In 1446 he joined a Portuguese expedition of discovery, and from an ardent desire to procure information for Prince Henry, he got leave to remain among the Assenhaji, or wanderers of the great African desert, in its Atlantic extremity. He stayed there seven months till his countrymen returned. His account has been strikingly corroborated in our days by that of Mungo Park. The date of his death appears to be unknown. (Kerr, *Systematic Collection of Voyages and Travels*, ii. p. 190.)

FERNANDEZ, FRANCISCO, born at Madrid, 1604, was, according to Palomino, one of the most ingenious painters of his time. He was employed by Philip IV. of Spain to execute several considerable works. His chief works were an 'Obsequies of St. Francis,' a 'St. Joachim,' and a 'St. Anne.' He was killed by a companion in a drunken quarrel in 1646.

FERNANDEZ, NAVARRETE, surnamed El Mudo (the dumb), born 1526 at Logroño, on the Ebro, became a distinguished pupil of Titian, and painter to Philip II., who employed him chiefly at the Escorial. His principal works are a 'Nativity of Christ;' a 'Martyrdom of St. James;' 'St. Jerome in the Desert,' and especially 'Abraham with the Three Angels.' He painted with great ease and despatch. On account of his colouring he was called the Spanish

Titian. There are many of his paintings in the Louvre. He died at Segovia in 1579.

FERNANDEZ DE NAVARRETE. [NAVARETTE.]

FERRARI, GAUDENZIO, a celebrated Lombard painter and sculptor, of the Milanese school of Leonardo da Vinci. He was born in Valdagno in 1484, was instructed by Luini, and, according to Orlando, he was a scholar of Perugino, but this is very doubtful. He was Raffaellique in style, and worked under Raffaele at Rome. He is enumerated by his countryman Lomazzo among the seven greatest painters of modern times, which is an absurd eulogy. He was correct in design, laborious and careful in his execution, and brilliant in his colouring; but his works are quite void of tone, though his figures are well rounded, and he can have had no knowledge of or feeling for harmony of colour. His outline is also hard, and the accessory parts, though laboured, are very indifferently executed. His colouring is extremely gay, but he used the positive or primary colours beyond all natural proportion. His principal works are in Milan, and are exclusively illustrative of the origin or mysteries of Christianity. He died in Milan in 1550. He had numerous pupils and imitators, of whom the most celebrated are Battista della Cerva, and Bernardino Lanino.

FERRARI, L. [FERREI and FERRARI.]

FERREI and FERRARI, the names of two Italian mathematicians, who were nearly contemporary with each other, and who are liable to be confounded. Scipio Ferrei (Cossali calls him Ferro and Dal Ferro) was a native of Bologna, and taught mathematics there from 1496 to 1526. He is said to have been the first who possessed a method of solving any case of cubic equations. This method he communicated to his pupil Antonio del Fiore, who proposed a question to Tartaglia as a challenge; and this, it is also said, was the cause of the latter turning his attention to the subject.

LUDOVICO FERRARI was also born at Bologna, and was the pupil of Cardan. At the instigation of the latter, he turned his attention to biquadratic equations, and produced the method known by his name, being the first which had been invented. The method is found in the work of Cardan (from whom the account of Ferrari is taken), and in all works of algebra which treat on the solution of equations.

FERRERA, ANTONIO, the reformer of the national poetry of Portugal, and surnamed the Portuguese Horace, was born at Lisbon, 1528. While studying law at Coimbra, he devoted his time more particularly to classical and Italian literature, but, unlike the then prevalent custom, determined to write only in his native tongue. He wrote at this time many sonnets and his drama of 'O Bristo' (which is the name of the principal character), to which he gave subsequently a much higher polish. He obtained a professorship at Coimbra, but growing tired of a university life, he went to court, where he obtained a dignified situation; and while entertaining still higher expectations, he was carried off in the prime of life by the plague in 1569.

Although not a first-rate poet in imagination and originality, Ferreira possessed taste, correctness, and deep thought. He often succeeded moreover in elevating the mind and warming the heart. His sonnets, without displaying any affected imitation of Petrarcha's, remind us of the Italian poet and his Laura. His odes and his bucolics have great merit in the expression, but the former want the genuine lyric spirit, and the latter the simplicity of the idyl; qualities perhaps irreconcilable with Ferreira's philosophical turn of mind and didactic seriousness. Among his elegies, that on May is a classic masterpiece. His epistles, written evidently when he was in his maturity, are the first productions of the kind in Portuguese literature. His tragedy of 'Ines de Castro,' written about the same time that the Dominican Bermudes wrote the similar and superior one in Spanish of 'Nise Lastimosa,' abounds with beautiful passages, but is deficient in true pathos, and displays a forced imitation of the Greek manner and style. As it was preceded only by Trissino's 'Sophonisba,' it has been considered as the second regular tragedy produced after the revival of letters in Europe. The 'Poomas Lusitanos' of Ferreira appeared at Lisbon first in 1598, 4to; and all his works were printed under the title, 'Todas las Obras de Ferreira,' Lisbon, 1771, 2 vols. 8vo, which contains Ferreira's biography, a valuable authority for the reader, in addition to that of Bouterwek and Simondi.

FERRE/RAS, DOCTOR DON JUAN, a most minute and accurate Spanish historian, was born at Labañeta, in the diocese of Astorga, June 7, 1652. Having gone through a complete course of classical and theological learning, Ferreras displayed his eloquence in the pulpit, and obtained the patronage of the great by his merit, and the esteem of all by his gentleness and modesty. Various honourable distinctions and situations were bestowed on him, but he constantly refused all high dignities. Next to the Duke of Escalona, he was at the head of the literati who founded the academy of the Lengua Española in 1713, and he was a very useful member of that body, especially in the compilation of its dictionary, in 6 vols. folio, published in 1726-1739, to which he contributed the articles in the letter G, besides a preliminary discourse on the Castilian tongue. At his death, in addition to his other appointments, he held that of librarian to Philip V. He died April 14, 1735. Ferreras, though not so elegant a writer as Mariana, is much more to be depended upon.

He wrote in all thirty-eight works, some of which remain unpublished; the most important is the 'Synopsis Historica y Chronologica de España,' Madrid, 1700-27, 16 vols., 4to. It extends to the close of Philip II's reign in 1598. Hermilli translated it into French, with valuable notes, in 10 vols., 4to, Paris, 1742.

* FERREY, BENJAMIN, architect, was born at Christchurch, Hants, April 1, 1810, and received his education at the Grammar-school at Wimborne, Dorset. He had whilst very young imbibed a taste for drawing, which was fostered by his admiration of the beautiful Priory Church at Christchurch and the Minster at Wimborne, of both of which at that early period he made many drawings. In 1826 he was articled to Augustus Pugin, author of the 'Specimens of Gothic Architecture,' and other well-known works. Amongst these was the 'Gothic Ornaments,' most of the lithographs in which were drawn by Mr. Ferrey and Mr. Talbot Bury, and deserve to be mentioned as executed in a superior style at a time when lithography was not so well understood as at present. Pugin's pupils were occasionally employed in the office of Nash. Mr. Ferrey and others were also engaged with Pugin during continental tours in drawing, and measuring the most remarkable buildings. Subsequently Mr. Ferrey was for two years with Wilkins, the architect.

Mr. Ferrey's principal title to a place in these pages will be considered as arising from his connection with the movement made towards the revival of Gothic architecture,—a style in regard to which his early pursuits gave him many advantages. He has of late years had a large practice, chiefly in church architecture. Amongst his chief works might be mentioned—St. Stephen's church, Westminster, and adjacent buildings, erected for Miss Burdett Coutts; churches at Eton, Esher, Morpeth, and Taunton; the restoration of the Lady Chapel of Wells Cathedral; additions to the Episcopal Palace, Wells, and to that at Cuddesden, Oxfordshire, and many others. He is architect for the Diocese of Bath and Wells, and has held the office of Vice-President of the Institute of British Architects. In 1884 he published a work with plates 'On the Antiquities of the Priory of Christ Church.'

FERRI, CIRO, a celebrated Roman fresco painter, born in 1634. He was the most distinguished scholar of Pietro da Cortona, and greatly assisted that painter in his extensive works in fresco, both in Rome and in the Palazzo Pitti at Florence. After the death of Pietro, Ferri was the first fresco painter in Rome, and the leader of the so-called *macchinisti*, a great faction, opposed to the school of Sacchi, at the head of which was Carlo Maratta. Ferri's works are of the same character as Pietro da Cortona's; many of them have been engraved. He died at Rome in 1689.

(Baldinucci, *Notizie dei Professori del Disegno*, &c.; Lanzi, *Storia Pittorica*, &c.)

FERRIER, MISS, was born at Edinburgh, about 1782, the daughter of a writer to the signet, and who was one of Sir W. Scott's colleagues as clerk of the court of session. This association almost necessarily produced an intimacy with the Scott family, and she had early access to the company of the best literary society of her native city. She was the author of 'Marriage,' published in 1818; 'The Inheritance,' in 1824; and 'Destiny, or the Chief's Daughter,' which appeared in 1831. They were all published anonymously, and thence Sir Walter Scott spoke of his "sister shadow," at the end of his 'Legend of Montrose,' as one peculiarly fitted to excel in the depicting of Scottish character, as proved by "the very lively work entitled 'Marriage.'" In the latter part of his life, when Miss Ferrier was one of his most trusted friends, her name occurs in his diary. Her novels are not entirely national; the characters are vigorously drawn, and thoroughly individualised; the plots tolerably well imagined and ingeniously developed; and the dialogues are spirited and life-like, sometimes humorous, and occasionally witty. The use of the Scottish dialect, as it is occasionally introduced with good effect, is the dialect actually spoken, and not the imitation which was occasionally heard upon the stage. All her novels were successful, and have become standards; but she seems to have written because she had accumulated observations and materials, and not from the love of either fame or profit. Sir Walter Scott, indeed, says of her, that in conversation "she was the least exigent of any author, female at least, whom I have ever seen." He adds: "she was simple, full of humour, and exceedingly ready at repartee; and all this without the least affectation of the blue-stocking." This appears to be a good representation of her whole character: acute and observant, she was too kind to wish to give pain, and too placid and contented to seek for applause. Though her satire is sometimes sufficiently coarse and caustic upon the grosser errors of human conduct, the sketches are relieved by scenes of humour, which, if sometimes exaggerated, like those of Miss Burney, are certainly laughable.

Miss Ferrier passed a peaceful and quiet life in her native town, associated with all the more distinguished of her contemporaries, and respected for her kindness and urbanity by every one who knew her. She died, aged seventy-two, in November 1854.

FESCH, CARDINAL JOSEPH, was born at Ajaccio, in Corsica, on the 3rd of January 1763; he was the son of a respectable citizen of Bale, and half-brother of Letitia Ramolini, the mother of Napoleon I. In 1776, his father sent him to the seminary of Aix, a college for preparing youths for the priesthood, where he was educated with much

care. During the revolution, the young abbé was like the rest of his brethren, driven from one place of concealment to another, until he at length sought refuge in the army of General Montesquieu, at that time quartered in Savoy. He suffered great privations during the Reign of Terror, but the sudden elevation of his nephew, General Bonaparte, after the 13th Vendémiaire (October 1795), in a moment changed his fortune. Bonaparte having been appointed to take the command of the army in Italy, prevailed upon the Abbé Fesch to withdraw from the church, and become one of the Commissioners, or factors, attached to it. He continued in this office, and performed all its functions, so different from those he had been used to, until the 18th Brumaire 1799. Bonaparte now felt that his uncle's services might be more effective in his first calling, he therefore induced him to resume the ecclesiastical habit after the concordat of 1801, and in April 1802 had him appointed archbishop of Lyon. The following year Archbishop Fesch was sent as ambassador to the holy see, taking with him as his secretary the young Viscount de Chateaubriand. The assiduous court paid to the pontiff by the archbishop during his sojourn at Rome, completely won the heart of the kind-hearted old man, who bestowed upon him the cardinal's hat, and consented to go with him to Paris to crown Napoleon. This had been the real object of his mission.

After the coronation of Napoleon I., at which he officiated, Cardinal Fesch became grand aumonier in 1805, received the grand cordon of the Legion of Honour, and was made a member of the senate. In 1809 Napoleon I. offered him the primacy, and actually announced his nomination, as Archbishop of Paris; but Cardinal Fesch, angry at the harsh treatment which the pope had received at his nephew's hands, rejected the offer. On the 28th November 1810, he openly rebuked the all-powerful monarch before the council of Paris, of which he was president, and bitterly complained of his aggression on the independence of the church. For this act of insubordination the cardinal was exiled from court, and ordered to return to his diocese at Lyon, where he continued in disgrace until the first abdication, in 1814. During the next few months the cardinal resided at Rome, but he hastened to Paris after the escape of Bonaparte from Elba. The battle of Waterloo compelled him a second time to take refuge in the pontifical court, where he spent the remainder of his life. He died on the 18th of May 1839, at the age of seventy-six. He was a patron of the fine arts, and had become possessed of a remarkably fine collection of ancient and modern pictures.

FESTUS, SEXTUS POMPEIUS, a celebrated Latin grammarian, whose age is not clearly ascertained, though there seems reason to believe that he lived in the third century of our era. He compiled an epitome of the voluminous work 'De Verborum Significatione' of Marcus Verrius Flaccus, a grammarian of the Augustan age, mentioned by Suetonius. The work of Verrius is lost, and that of Festus being afterwards abridged in the ninth century by Paulus Diaconus, who spoiled it, the text of the epitome became lost also for several centuries, until a mutilated copy, found in Dalmatia, came into the hands of Aldo Manuzio, who published it, together with the abridgment by Paulus Diaconus. Other fragments were found in the Farnesian Library, and Antonius Augustinus, Joseph Scaliger, and Fulvius Ursinus published improved editions of Festus' 'De Verborum Significatione.' Lastly, A. Dacier published a new edition, 4to, Paris, 1681, adding to it the notes of Scaliger, Augustinus, and Ursinus. Dacier's edition was reprinted at Amsterdam in 1699. In 1832 Lindemann in the second volume of his 'Corpus Grammaticorum Latinorum,' has made a complete separation of the texts of Festus and Paulus, and carefully revised each, as well as added a body of valuable notes; but the most useful and complete edition is that of K. O. Müller, 4to, Lips., 1839. Festus, in a passage of his work under the head 'Profanum,' refers to another vocabulary which he had written explanatory of ancient Latin words which had become obsolete, 'Priscorum Verborum Libri cum Exemplis,' which words he left out in his epitome of Marcus Verrius. This work, 'Priscorum Verborum,' is lost. Festus gives not only the meaning, but also in most instances the etymology, of words, with reference to Verrius, Cato, and others of his predecessors; and his book, though incomplete, is justly classed by Scaliger amongst the most useful for understanding the language of ancient Rome.

FETI, DOME'NICO, called Il Mantuano, was born at Rome in 1589. He was the scholar of Cigoli, but was appointed his court painter by Ferdinando Gonzaga, duke of Mantua, whither he removed from Rome; whence his name of Mantuano. Feti executed several works at Mantua, of which his oil pictures were the best; many have been engraved: his masterpiece is the 'Feeding of the Five Thousand,' in the Academy of Mantua. He died at Venice in 1624, aged only thirty-five. (Baglione, *Vite de' Pittori*, &c.; Lanzi, *Storia Pittorica*, &c.)

FEUERBACH, PAUL JOHANN ANSELM, the most celebrated German writer on criminal law, was born at Frankfurt-on-the-Mayn, May 14th, 1775. After having studied at Jena, he gave lectures there on law in 1798, and became successively professor at the universities of Giesen, Jena, Kiel, and Landshuth. While he was a lecturer at Jena he published his 'Anti-Hobbes, or, on the Limits of Civil Power, and on the compulsory Right of Subjects against their Sovereigns' ('Anti-Hobbes oder über die grenzen der bürgerlichen

gewalt und das zwangrecht der unterthanen gegen ihren oberherren'); and a number of essays inserted in the 'Magazine of Criminal Jurisprudence.' But the work which established his fame was his 'Review of the fundamental Principles and Ideas of Penal Law,' which appeared shortly afterwards. His 'Critique of the project of a Penal Law for Bavaria,' published in 1804, is another remarkable work. These purely theoretical essays exercised a very considerable influence on the criminal legislation of Germany, and were soon followed by practical effects. Almost immediately on the publication of the last-mentioned work, and while he was professor at Landshuth, the Bavarian government entrusted him with drawing up a project of a criminal code for the kingdom, which, after having been submitted to a commission, was adopted, with very few modifications. The principles previously promulgated by Feuerbach were all incorporated in this project, which is characterised by logical connection, strict definitions, complete development of the principle of penal law, correct generalisation and specification of crimes and misdemeanours, and precise determination of penalties. Its consequences were immense, for previously to its publication criminal jurisprudence in Germany was in a deplorable state. Its excellence both in substance and form was such, that it was adopted as the basis of similar attempts at a reform of criminal law by other portions of Germany and Switzerland. Saxony, Württemberg, Hanover, Oldenburg, and Weimar, and the cantons Zürich, St. Gall, Basel and the Grisons, modified their codes in accordance with it. In 1808 Feuerbach was created privy councillor, and received a commission to adapt the Code Napoleon to the wants of Bavaria; the result of his labour however was not adopted.

That criminal law has become a science, and that this science has had a great influence on legislation all over the continent, is to be mainly attributed to this gifted man. Criminal law which had been harsh and bloody became humane: liberty of action was substituted for previous restraint, and the conditions were pointed out under which the state ought to interfere by penalties with the rights of the citizens. The former arbitrary power of the judges was circumscribed; deep-rooted and vague notions gave way to the inflexible but necessary bounds of law. If, on the one hand, it must be admitted that Feuerbach, by his philosophical inquiries and liberal conceptions, powerfully influenced the elements and principles of modern criminal law, it is to be regretted, on the other hand, that by his subsequent publication, 'Considerations on the Jury,' he has promulgated singular opinions on the spirit and efficacy of that institution. The leading idea of this work consists in the proposition that the verdict of the jury is insufficient to establish the legal evidence of crime. After having been assailed by a number of eminent writers, and in particular by Grolman, Feuerbach modified his opinions on the jury in 1821, during a visit to France, Belgium, and the Rhenish provinces, on a mission from the Bavarian government to investigate the legal institutions of those countries. On his return he published the result of his inquiries in his 'Reflections on the judicial Organisation and Proceedings in France,' a work remarkable for the sagacity with which he lays open the deficiencies and inconveniences of all the French civil and penal legislation. A very able part of that work is the comparison of the French and English juries, which is entirely in favour of the latter, as, according to Feuerbach's opinion, the principles of that institution are completely perverted in France by the rules laid down during the empire for the composition of the jury. Like Berenger, Dupin, and other French writers who have exposed the faults of the existing mode of criminal proceedings in France, Feuerbach has stigmatised the French jurymen by calling them the twelve commissioners of government. Notwithstanding he had altered his opinion on the jury generally, and although by his remarks on the English jury in particular, he seems to have made amends for his former animosity against it, he still retained some prejudices against that institution, on account of its being fraught with too many democratic principles. This tendency of Feuerbach's opinion had a very unfavourable influence on the Bavarian government when the introduction of that institution came under consideration, and ultimately it was the cause of the jury not being granted to the country.

In 1817 Feuerbach was made second president of the court of appeal at Bamberg, and in 1821 he was nominated first president of appeal at Anspach; to those functions his sphere of action was latterly entirely confined, with the exception of opinions given in important civil and criminal cases. One of those was the notorious affair of Kaspar Hauser, which produced so much sensation all through Europe. With his wonted and acknowledged perspicuity he has investigated this revolting case, and has recorded the results of his inquiry in his last work, 'Kaspar Hauser, an instance of a psychological crime.' The two following passages of that book seem to implicate a reigning family of the south of Germany. Those passages are:—1. "There are spheres of human society which are inaccessible to the arm of justice." 2. Those spheres are defined as "golden castles, the entrance of which is guarded by giants who do not allow a ray of light to penetrate." A rumour obtained circulation that his sudden death at Frankfurt, in May 1833, was not unconnected with that mysterious affair, the veil of which appears to have been lifted by him. His connection with the Bavarian government became in latter years very disagreeable in consequence of his decided opposition to its illiberal policy.

Feuerbach was a man of polite acquirements as well as of professional eminence. The elegant diction of his productions has powerfully contributed to improve the style of recent German writers on law. In this respect his 'Exposition of remarkable Criminal Cases, founded upon documents,' merits particular mention. Previously to Feuerbach's time all similar essays were heavy and uninteresting, in consequence of all the documents being accumulated in their original uncouth form, without order or regard to the really interesting features of the case, namely, the development of psychological considerations. It was he who first united to professional soundness of exposition elegant and convincing diction. This work, which is written with true poetical talent, is a remarkable specimen of investigation into the human heart, rendered still more striking by the most delicate and humane estimation of actions; it may be considered at once a model of exhaustive inquiry and a book of morals. In bold and vivid language he has promulgated the doctrine that it is impossible perfectly to harmonise the inflexible universality of law with individual culpability, and that it therefore is an unavoidable necessity, in particular cases, to modify and soften the sentence of the law by the prerogative of the sovereign.

FICHTE, JOHANN GOTTLIEB, was born in Upper Lusatia in 1762. After receiving a school education, he studied at the universities of Jena, Leipzig, and Würtemberg. He afterwards became acquainted with Kant and Pestalozzi; and in 1792 attracted general attention by his 'Versuch einer Kritik aller Offenbarung' ('Attempt at a Critique of all Revelation'), on account of which he was made professor of philosophy at Jena. Here he began to promulgate the system of philosophy which is known under the name of 'Wissenschaftslehre' ('Doctrine of Science'). A treatise on Faith and Providence which he wrote at Jena having brought upon him the suspicion of irreligion, he retired to Prussia, and after living for some time at Berlin, removed to Erlangen, where he was appointed professor of philosophy, with leave to visit Prussia in the winter time.

The character of Fichte has always been held in high esteem. His 'Discourses to the German People' during the French invasion are justly valued, and he is said to have died, as he always lived, for a good cause. During his residence at Berlin in the year 1814, he urged his wife to visit the sick in the military hospital of that city; in consequence of which she caught a fever, from which she recovered, but communicated it to her husband. Fichte died at Berlin in 1814, leaving a son, Immanuel Hermann, who became a professor at Bonn, and acquired considerable distinction as a writer and teacher of philosophy.

Fichte's 'Wissenschaftslehre' grew out of the philosophy of Kant, of whom he at first considered himself a mere disciple. Kant had dogmatically assumed the school logic as the foundation of his system; the forms of propositions, as affirmative, negative, &c., had supplied him with his table of categories, and he never thought that any one would ask for the origin of these forms themselves. According to the system of Kant, time and space have no existence exterior to the mind, but are merely the forms in which it discerns objects, and which only abide in itself. An intuition (or immediate contemplation) was divided into matter or form: thus in a red surface, the mere colour red was called the matter of the intuition, and the extension its form. The first was held to be a manifestation of something external to ourselves; the latter as merely dwelling in our own minds. This was Kant's theory of sensation ('Transcendentale Ästhetik') and it is followed by an investigation of the laws of the understanding. These laws he worked out from the table of categories, which, as before said, was constructed from the logical form of propositions. Thus, propositions are divided into universal, particular, and singular. Hence the objects of propositions considered in this light, are 'all,' 'many,' or 'one,' or may be said to come under the categories of 'totality,' 'multiplicity,' and 'unity.' In the same manner, from the divisions of propositions into affirmative, negative, and infinite, Kant got the categories of 'reality,' 'negation,' and 'limitation,' and from the division into categorical, hypothetical, and disjunctive, the categories of 'substance and accident,' 'cause and effect,' 'action and reaction.' A fourth series of categories obtained from the modal division are 'necessity,' 'actuality,' 'possibility,' and as we cannot think of objects at all except under the forms expressed by these propositions, it follows that all objects of thought must come under the categories. From this Kant concludes, that as time and space are the forms of our intuition, so are 'cause and effect,' &c., the forms of our thought, having likewise no existence without our own minds; and that when we say the law of cause and effect is a law of nature, no more is conveyed than that the law of cause and effect is that under which we are compelled to observe nature, having nothing to do with external things themselves. Kant compares his own system to that of Copernicus, observing that the latter makes the planets move round the sun, and that he in the same manner puts the mind in the centre, and makes the objects adapt themselves to the forms of the mind, instead of the mind following the laws of the objects. Hence, according to his view, we are altogether without knowledge of things in themselves, the extended form in which they appear being merely in our own mind, and likewise the laws by which we suppose they are regulated. We merely contemplate various phenomena, which are the exponents of things we cannot know anything about, and to which these very phenomena

do not bear the slightest resemblance. This is not intended as a complete view of the system of Kant, but only a sketch of so much of it as will serve to render the account of Fichte intelligible.

Various contemporaries had found it strange that two regions so heterogeneous as those of mind and things in themselves ('dinge an sich') should at the same time be so admirably adapted to each other, that the latter should accommodate themselves to all the forms of the former; and at the same time, the taking of a common book of logic, assuming all its *dicta* as self-evident axioms, seemed rather a superficial proceeding. The sceptical adversaries challenged the Kantists to prove that there was a necessary connection between the form and the matter of knowledge.

Aroused by these attacks, Fichte, as a disciple of Kant, began to inquire what was the absolute form of knowledge, and at the same time what lay at the foundation of logic, the mere assumption of which, as a self-evident science, did not satisfy him. He saw that all logic depended on the propositions of identity and contradiction. 'A is A,' and 'Non-A is not A.' He then asked himself what is meant by 'A is A'; does it imply that A exists? No, because the proposition 'A centaur is a centaur' is a true one, though the centaur does not exist at all. 'A is A' means no more than 'If A is given, it is A;' and A is not A, provided it is not given ('gesetzt,' posited). 'Given' implies 'given to some conscious being;' and hence we find that the truth even of an identical proposition depends on the being of an I or Ego ('das Ich'). The proposition 'A is A' is converted into 'Ego is Ego;' and this is found to depend on no condition, as Ego gives itself, and its very essence consists in its giving itself. From this proposition is obtained the category of reality: reality is that which is given to the Ego. In like manner 'Non-A is not A' is converted into 'Non-Ego is not Ego;' and from this proposition is obtained the category of negation. Then a question arises, 'How can Ego posit Non-Ego?' It is assumed as an axiom that everything in Ego is posited by itself; how then can it posit a Non-Ego, which seems an act of self-destruction? It then turns out Ego posits itself, as determined by Non-Ego. An undetermined being is nothing; determination implies limitation, and hence Ego, by positing itself as a determined being, at the same time posits Non-Ego. The Ego is conceived at first as an unimpeded activity; it meets with a shock ('anstoß'), which causes it to perform an act of reflection, and from this moment it begins to construct a world without itself. It feels itself confined by certain sensations, and hence imagines there must be a being external to itself supporting these sensations. At the same time the very consciousness of confinement implies a consciousness of the capability of freedom; for no being can be aware of a curb that is not striving against it. Freedom manifests itself in the power of directing the attention to some objects to the exclusion of others, or in the imagination of such as are absent. Thus a child who sees its first object cannot divert its attention from that object and think of another; it is completely curbed by the present; while a person who has seen a variety can at pleasure call forth a distant object, and close his mind's eye upon those immediately before him. This is a state of comparative freedom. It is impossible, in this limited space, to follow the 'Wissenschaftslehre' through all its ramifications; but what is given above will serve to convey an idea of the principle. Fichte's adversaries accused him of Nihilism and Atheism, and seem to have imagined that he thought he had constructed the whole universe. These objections are answered by his son, in an excellent little book, entitled 'Beyträge zur Charakteristik der neuern Philosophie,' in which he shows that the very being of the Ego proves its own finity, and that consequently his father's doctrine necessarily leads to the assumption of the 'absolute,' or God, a being that is infinite. In a tract called 'Die Wissenschaftslehre in ihrem allgemeinen Umriss dargestellt' (Berlin, 1810), the elder Fichte says plainly that God is the only true being, and thus banishes all suspicion of Atheism. His moral doctrines involve a contempt for nature, which he regards as a mere curb over which freedom should triumph; and hence he is averse to all speculative physics, considering nature as the absolutely 'given' of which there can be no knowledge, and making all reality proceed from the 'knower,' he denies reality to the former. These opinions have led the philosophers of nature ('Natur-Philosophen') to accuse him of one-sidedness. His son attributes this tendency to the influence of the doctrines of Kant, which always treated nature as a mere appearance ('Erscheinung'), and from which Fichte never became absolutely free.

It is hardly to be expected that the 'Wissenschaftslehre' will be rendered perfectly intelligible by the above short notice, when the reader might turn over the whole works of Fichte, and still find the subject intensely difficult and obscure. The design of this article has been to give a hint of the principle, and no more.

FICINO, MARSILIO, born at Florence in 1433, was the son of Ficino, the physician of Cosmo de Medici, who perceiving the happy dispositions of the youth, generously provided for his education. Ficino studied Greek, and applied himself especially to the works of Plato, which he translated into Latin. He afterwards translated Plotinus, Jamblichus, Proclus, and Porphyrius, and became a great admirer of the late Platonicians of the Alexandrian school. He was one of the preceptors of young Lorenzo, Cosmo's grandson. Cosmo appointed him president of the literary society which he assembled at his house, and which was called Academia Platonica, having for its

object to explain the doctrines of the Platonists. Its meetings, which were greatly encouraged by Lorenzo, were cheered by symposia, or annual banquets, on the anniversary of Plato's birthday, of one of which, held at the villa of Careggi, Ficino has given an interesting description. The Academicians were divided into three classes: 1, the *Mecenati*, being the family of the Medici; 2, the teachers, who consisted of the most learned men of the time, such as Pico della Mirandola, Poliziano, Leon Battista Alberti, Landino, and others; 3, of pupils. (Bandini, 'Specimen Literaturæ Florentinæ,' vol. ii.; Brucker, 'Histor. Philos.,' tom. iv., period the third, b. 1.)

At the age of forty Ficino resolved to devote himself to the church, and being ordained, his patron Lorenzo conferred upon him a canonry in the cathedral of Florence. He now made an attempt to amalgamate the theology of Plato with Christianity, and in so doing was carried by his zeal beyond the limits of sound judgment or propriety. He is said however to have been sincere and single-minded, exemplary in his private conduct, mild and moderate in his temper, and averse from literary feuds and polemics. But his writings savour everywhere a great deal more of the heathen philosopher than of the Christian divine. Being of a diminutive size, and of very precarious health, he says himself that he hardly passed a day without bodily pain, and yet he constantly applied to study. Much of his time was spent at the various country residences of the Medici near Florence, in which he composed his works. He died in 1499, at the age of sixty-six, and his countrymen raised to him a monument in the cathedral of Florence, with his bust, and an epitaph written by his friend Poliziano. His works were collected and published at Basel, 2 vols. folio, 1491. They consist of translations from the Greek philosophers, original treatises on metaphysics and ethics, his 'Theologia Platonica,' and other writings. His Latin epistles, which were published separately at Venice, 1495, are interesting on account of the details which they contain concerning the distinguished scholars collected at Florence by the fostering patronage of Lorenzo. Ficino wrote also a work 'De Religione Christiana,' and a commentary on the Epistles of St. Paul. (Roscoe, *Lorenzo the Magnificent*; Corniani, *Secoli della Letteratura Italiana*.)

FIELD, NATHANIEL, whose name is for several reasons interesting in the history of the old English drama, was professionally a player. As early as the year 1600 he was one of the Children of the Chapel, afterwards called Children of the Revels, youths who were trained to act plays before the court, and he continued in that company till after 1609. He then became a member of Shakspeare's company, the players of the Globe and Blackfriars theatres, among whom he is named in the list prefixed to the folio of Shakspeare's works printed in 1623. Two years later his name disappears; and in 1641 he is mentioned as 'gone,' which probably means that he was then dead. Besides these circumstances, the only ones known in his history are such as show him to have been poor and distressed. He was the writer of the famous begging-letter, addressed to Henslowe, by himself, Dabcone, and Philip Massinger; and among Henslowe's papers are two other letters of the same melancholy tenor. Field wrote a part, and perhaps Gifford does him less than justice in the quantity he assigns to him, of the fine tragedy of 'The Fatal Dowry,' printed among the works of its other poet Massinger. He is also the author of two comedies, both of which were written between 1605 and 1611; 'A woman is a Weathercock,' first printed in 1612, and 'Amends for Ladies,' first printed in 1618, and again in 1639. Both are included in a small collection, 'The Old English Drama,' 4 vols. 12mo, 1830; and in Collier's 'Supplement to Dodsley's Old Plays,' 1833. They abound in spirit, incident, and variety.

FIELDING, COPLEY VANDYKE, was born about 1787, and belonged to a family several of the members of which were artists of greater or less ability. Copley Fielding exhibited his first pictures at the 'Artists' Exhibition, Spring-Gardens, in 1810. It was by his water-colour landscapes that he first attracted notice, and though he subsequently made many attempts to achieve success as a painter in oil, it is by his paintings in water-colours that he will be remembered. Mr. Fielding began the practice of the art about the time that Girtin and Turner had succeeded in raising the practice of water-colour painting almost to a level with that of oil-colours, and Fielding devoted himself with thorough earnestness of purpose to the new art.

From an early period in his career he became a teacher, and he had in that line an unusual measure of success, as well in the progress of his pupils as in their number and social position. His success as a teacher of course did much to secure for him a wide circle of patrons and friends, which the merits of his works effectually maintained. His course was one of steady prosperity, quite devoid of adventure. His time was constantly occupied either in teaching or painting, or in those sketching excursions which were to furnish him with the materials for new pictures. For many years Mr. Fielding held the office of President of the Society of Painters in Water-Colours, and his position was generally recognised as that of the head and representative of his branch of art in England; the more readily no doubt in consequence of the estimation in which his personal as well as professional qualities were universally held. He died March 3, 1855, in his sixty-eighth year, at Worthing, Sussex, where, or at Brighton, he had for a long period been accustomed to spend his autumns.

Copley Fielding painted perhaps a larger number of landscapes than any other among his contemporaries of anything like equal standing in the art. Of course this was in a great measure owing to his remarkable mechanical dexterity; to which also was unquestionably due much that was at first sight most striking and characteristic in his works. His 'execution' as it is technically called, was indeed very noticeable. The peculiar texture of his pictures was usually as much produced by the use of sponge and cloth as by brush or pencil; and this manipulative trickery—for in the excess to which he carried it such it eventually became—like every kind of clever charlatanism, found a body of enthusiastic admirers, and secured for his pictures eager purchasers at high prices. But it had necessarily a mischievous influence on the painter, and, as far as his example extended, on art. Manipulative dexterity is always easier than that careful and specific imitation which is the result of continuous observation and conscientious thought: and the indulgence in any mechanical trickery inevitably leads, as was the case with Fielding in his later years, to the frequent repetition of certain peculiarities of effect, and to mannerism.

But Copley Fielding was undoubtedly one of the very best of our many admirable landscape painters in water-colours; a body of artists especially distinguished by a true and simple rendering of natural scenery, and by a decidedly original and self-dependent study of it. His range of subjects was not very extensive, but within it he was almost unrivalled. Of our broad chalk downs, with their sunny slopes, wooded hollows, and glimpses of near or remote ocean, or the soft vapoury stretches of distant Kentish or Sussex weald, Copley Fielding may fairly be said to be the first who felt the poetry, and who perceived their exquisite adaptation to pictorial art; and often as other artists have since essayed to represent the South Downs, he remains as yet their only adequate painter. In depicting our English, Welsh, and Scotch mountain and lake scenery too, under certain atmospheric conditions, he was equally at home, and so also in those combinations of river, hills, and foliage, of which his 'Bolton Abbey' may be regarded as the representative; while his stormy marine views, though they became of late years more and more conventional, were always deeply impressive, and sometimes extremely grand. But in all there are the faults arising from insufficient study—from the excessive rapidity of production allowing scarce any subject to be fairly thought out and wrought into a finished and master-like picture. The colour, exquisite as it often is in parts, is too often crude; the forms are unstudied, the drawing excessively loose, and the chiaroscuro conventional. At least such, with all their brilliancy and richness of effect, is too commonly the case with his more recent pictures; many of his earlier ones are, as far as they go, among the most successful and satisfactory pictures of their class which have been produced by any painter.

FIELDING, HENRY, born April 22, 1707, was the son of General Edmund Fielding, a descendant of the earls of Denbigh. He was nearly connected with the ducal family of Kingston, and thereby with Lady M. W. Montagu. Being designed for the bar, he was removed from Eton to the University of Leyden, where he is said to have studied with application; but owing to the limited nature of his finances, he was compelled to return to London, where he plunged into all the dissipation of the metropolis. His first resource as a means of support was writing for the stage; and between 1727 and 1736 he produced eighteen comedies and farces, of which not more than two or three are now known or read.

About the year 1736 Fielding married. His wife's portion and a small estate, inherited, as is supposed, from his mother, enabled him to retire from London; but his habitual extravagance again brought him into difficulties, and after three years he became a student at the Temple, with the view of retrieving his fortune at the bar. At the usual time he was called; but gout, the consequence of his early dissipation, rendered it impossible for him to practise with regularity sufficient to insure success. During the interval which preceded his call to the bar, he supported his family by pamphlets and essays on the passing occurrences of the day; and at this time two events happened which seem to have influenced the whole of his remaining career: the death of his wife, to whom he was fondly attached, and the publication of Richardson's novel of 'Pamela,' which gave him an opportunity to enter upon an employment which he found preferable to the study of law. He now wrote what professed to be the counterpart of 'Pamela,' the history of her brother, 'Joseph Andrews,' who undergoes a variety of trials of a kind similar to those which make Pamela's career so interesting. The whole book is intended as a satire on 'Pamela;' but the author visibly warms with his subject, and draws characters which perhaps none but himself could have drawn in any case, and not even he, had he kept his primary object distinctly in view.

The character of Parson Adams has been applauded and appreciated so often that it would be vain to say anything in its praise; Nichols ('Literary Anecdotes,' iii., 371) informs us, that it was taken from a clergyman named Young, and indeed it seems almost impossible that so peculiar a character should have been the work of imagination, for there is perhaps scarcely anything so difficult for a novelist as to draw singularity without allowing it to lapse into improbability and extravagance. Sir Walter Scott relates ('Life of

Fielding,' pp. 95, 96), that Richardson took mean and petty methods of revenging himself upon his successful satirist, by depreciating him before members of his own family, and by endeavouring to diminish his reputation as an author. Fielding however did not make reprisals, but contented himself with noticing *Clarissa* in a favourable manner, in a publication which he at that time conducted, called 'The Jacobite Journal.'

After the publication of 'Joseph Andrews,' Fielding wrote another play, 'The Wedding Day,' and a tract called 'The Journey from this World to the next,' which were followed by 'Jonathan Wild.' The Rebellion of 1745 induced Fielding to take the direction of a paper called 'The Jacobite Journal,' directed against the party known by that name, and in support of the Hanoverian succession. This, with other publications of the same kind, at last obtained him a small pension and the place of Justice of the Peace for Middlesex and Westminster, which he is said to have owed to the influence of Lord Lyttelton.

Horace Walpole, with his usual mixture of foppishness and malice, gives a very unfavourable account of Fielding's habits at this period, but the account is so manifestly written for effect, and so palpable a distortion of the truth, that little regard need be paid to it—if indeed a sufficient explanation cannot be given of the circumstances related (see Lawrence's 'Life of Fielding.') Fielding's conduct as a magistrate proved a strong contrast to the usual iniquity of the so-called trading justices, one of whom he describes so forcibly in 'Amelia' under the name of 'Justice Thrasher.'

Amidst the laborious duties of a magistrate and pamphleteer, for Fielding was both at once, he contrived to produce 'Tom Jones,' a novel which for graphic description, originality of characters, and interest of the tale, has been and ever will be held in the very highest admiration. The publication of 'Tom Jones' was followed by some works on Poor Laws, in one of which he appears to have struck out a scheme not very dissimilar in principle to that which is now adopted. He also wrote a 'Charge to the Grand Jury of Middlesex' and some Law Tracts.

'Amelia' was Fielding's last important work. It was published in 1751, soon after which time he was attacked by dropsy, jaundice, and asthma, and when all remedies had been tried in vain, the last remedy of self-banishment was proposed by his physicians. He left England for Lisbon on the 26th of June, 1754, and died there in October of the same year, aged forty-seven, leaving a widow and four children.

Fielding has been styled, with perfect justice, the father of the English novel. Sir Walter Scott observes that Richardson by no means succeeded in escaping from the trammels of the French romance. His characters have a strong touch of the impossible virtue and improbable heroism of that class of writing; and the length of 'Sir Charles Grandison' bears no small resemblance to 'Le Grand Cyrus.' But in Fielding's works we find the most perfect delineations of individual character—Squire Western, Tom Jones himself, Allworthy, and perhaps above all, Amelia and Mr. Abraham Adams, are portraits which proclaim their own truth. Every reader of Fielding must have been struck with the deficiency of individuality in his heroines. This arose, we believe, not so much from want of power in the artist, as from the low state of feeling then prevalent with respect to women, which placed them, while unmarried, in the light of a plaything; and when married, in that of an upper servant, or at most a humble companion. Such our author describes Mrs. Western to have been; and while this state of manners continued, it was impossible for any writer professing to give a true picture of the times, to attempt to invest his heroines with such mental attractions as are possessed by the female characters of modern novels. His waiting-maids and landladies are full of life and energy, which makes it still more improbable that his genius should not have been adequate to portray women of higher station.

Opinions have been much divided as to the tendency of Fielding's works. We have little hesitation in pronouncing it to be, on the whole, moral, and decidedly more so than that of Richardson's. It is true that scenes of extreme indelicacy occur, often very unnecessarily, but the manners of the time admitted allusions and even expressions at which we should now feel the greatest disgust. Squire Western addresses his daughter in terms and on subjects which no female would now endure; and this under circumstances where no very grave annoyance was intended; but in spite of all this coarseness there runs through all Fielding's works an honest appreciation of right and wrong, with no attempt to palliate bad actions by specious phrases. The character of Tom Jones seems to us not to have met with a fair share of praise. His generosity and nobleness of nature are, it is true, partially obscured by connections of a degrading kind into which he so often falls; but however much he may fall of perfection, he cannot be called depraved. His love for Sophia is an affection of a kind which no thoroughly bad heart could entertain. He has all the materials of a fine character, and therefore there is no poetical injustice in marrying him to Sophia, and thereby putting him in a situation to redeem himself from the folly and vice into which he has been thrown. 'Amelia,' the author's last important work, bears the stamp of declining powers, with an appreciation of female character perhaps more delicate than we find in 'Tom Jones' or 'Joseph Andrews.' Booth and Amelia are said to have been portraits of Fielding and his second wife.

In summing up our opinion of Fielding's works, we should say that the chief fault is a want of unity in the plots. A novel is not a professed record of all which happens to any two people during a certain number of years. To make it perfect it requires extraordinary combinations tending to a certain end—the happiness or misery of the parties concerned. We do not reject these as improbable, but acknowledge them as constituting an integral element of the work. But we are not satisfied by a succession of petty annoyances and pleasures which have nothing to do with the conclusion of the tale. These rather disturb than interest our attention, and we would prefer being without them. But this is a minor fault, and very little seen in 'Tom Jones,' the author's best work; while to counterbalance it we have truth and originality of delineation, skill in language, considerable dramatic power, and brilliancy of wit which has never been surpassed.

FIE'SOLE, FRA GIOVANNI DA, frequently called, from his character, Beato Angelico, is one of the most celebrated of the early Italian painters. His real name was, according to Vasari, Giovanni Guido, and he was a distinguished member of the brotherhood of Predicator monks at Fiesole. His name is however variously given, as, for instance, Santi Tosini, and Giovanni di Pietro di Mugello. He was apparently born in Mugello in 1387, and he entered the order of the Predicator monks at Fiesole in 1409. Little or nothing further is known either of his origin or his education. He early distinguished himself for his miniature illuminations of religious books, of which there are still some in the convent of San Marco at Florence, where he painted several works for Cosmo de' Medici, of which the history of the Passion of Christ in the refectory is still in comparative preservation. Giovanni learnt the art of illuminating or miniature painting from an elder brother, Fra Benedetto di Pietro di Mugello, or, Latinised, Benedictus Petri de Mugello.

He painted also many admirable works in the Carthusian church, in Santa Maria Novella, and in the Nunciata and other churches in Florence; in San Domenico at Fiesole; in the cathedral of Orvieto; at Cortona; and in the chapel of San Lorenzo in the Vatican, and in the Minerva at Rome. He was invited to Rome by Pope Niccolò V., who offered him the high dignity of the archbishopric of Florence, which however Giovanni was too modest to accept: he pleaded that to govern or to lead was alike incompatible with his nature. The appointment was given to another monk of the same order as Giovanni, Fra Antonio, who was canonised by Adrian VI.

The frescoes in the chapel of Niccolò V. are in great part still in a good state of preservation, though they have been restored. The chapel was long neglected, and public attention was first called to these frescoes by Hofrath Hirt, of Berlin. The principal subjects represent the leading events of the lives of Saints Stefano and Lorenzo, and their martyrdoms; on the ceiling are the four evangelists; around the chapel also are the doctors and fathers of the church—Saints Thomas Aquinas, Bonaventura, Athanasius, and John Chrysostom, Augustin, Ambrose, Jerome, and Gregory—and a 'Descent from the Cross' was painted above the altar, but it has been whitewashed over. This chapel is described in Platner and Bunsen's 'Description of Rome,' and there are small outlines of the frescoes in D'Agincourt's 'Histoire de l'Art par les Monumens,' and larger in a special work by Giugiacconi, 'Le Pitture della Capella di Niccolò V., opere del B. Gio. Ang. da Fiesole,' Rome, 1810; also two of the principal subjects—'The Preaching of St. Stephen,' and 'St. Lawrence giving Alma'—are etched in Ottley's series of plates after Florentine paintings. These works of Fra Giovanni, as well as those in the convent of Saint Mark at Florence, and others elsewhere, though as mere abstract designs or works of art they are comparatively crude and feeble, and inferior to the works of Masaccio, are with reference to their subjects perfect in their sentiment, and in expression admirable, and have not been surpassed by the works of any of the great painters who followed him. His works are exclusively religious or ecclesiastical; and they breathe the purest piety and humility, which are the vivid impressions of his own mind and character. The genuineness of his sentiment and expression was so self-evident that his works became in a great degree, mediately when not immediately, the type of character for religious art to his own and to subsequent generations.

Though his works have not as regards style that plastic development which we find in Masaccio, the inferiority is not great, but he survived Masaccio some years. Giovanni's execution is sometimes extremely elaborate and even beautiful, especially in his small easel panels painted in distemper. There is a small gallery of these works in the Academy at Florence, of which the most remarkable piece is a 'Last Judgment,' containing a great variety of figures.

Fra Giovanni was remarkably methodical in his habits. It was his maxim that whoever would represent the works of Christ must be always with Christ; he accordingly never commenced any work without praying, and he always carried out the first impression, believing it to be an inspiration: he never retouched or altered anything once left as finished. He died in 1455, twenty-eight years before the birth of Italoello.

(Vasari, *Vite de' Pittori*, Lanzi, &c., and the notes in Schorn's German translation; Speth, *Kunst in Italien*; Rumohr, *Italienische Forschungen*.)

FILANGIERI, GAETANO, was born at Naples in 1752, of a noble family. In his early youth he did not exhibit any signs of extraordi-

nary talent, but after being put under the care of Monsignor de Luca, bishop of Trivento, he made rapid progress in the classical languages, mathematics, and philosophy. In 1774 a reform in the judicial administration was determined on by the ministers of King Ferdinand, by which the judges of the various courts were in future to explain the grounds of their decisions by referring to some existing law applicable to each respective case, and in default of such a law to ask the king for his decision. This determination, which checked the till then absolute discretion of the courts, was strongly opposed by the judges, supported by most of the law practitioners, as offensive to the dignity and independence of the courts, and they published a violent memorial on the occasion. Filangieri took up the matter, and wrote a reply, showing the absurdity and impertinence of the objection, as insulting alike to the liberty of the citizen and to the authority of the crown: 'Riflessioni politiche sulla Legge Sovrana del 23 di Settembre, del 1774.' The work was favourably noticed by the government, which enforced its decree regardless of the clamours of the interested party. Those were times of useful reforms and enlightened administration at Naples, when Genovesi, De Iorio, Galanti, Palmieri, Galiani, and other learned men were encouraged in suggesting improvements which were at least in part acted upon. In 1780, Filangieri, then twenty-eight years of age, published the first volume of his great work, 'Scienza della Legislazione,' which made him known throughout Europe: he went on publishing the successive volumes in the following years. In 1787 he was appointed a member of the Supreme Council or Board of Finances, a department which stood also in need of reforms. In July 1788 he died, when only thirty-six years of age, regretted by all Naples, and leaving his work on legislation incomplete. The work however has gone through many editions, and has been translated into several languages; one of the best editions of the Italian text is that of the 'Classici Italiani,' 6 vols. 8vo, Milan, 1822, to which are added his 'Opuscoli Scelti,' or minor works. Among the translations the French one (Paris, 1822) contains a biography of Filangieri by his countryman, Salâ. Benjamin Constant wrote a 'Commentaire sur l'Ouvrage de Filangieri,' 2 vols. 8vo, Paris, 1822-24.

Filangieri aimed at effecting a change in legislation without a corresponding change in the forms of the government, and in his time, and especially in Italy, where numerous and important reforms emanated from the sovereigns themselves, this course appeared both reasonable and prudent. He says, in the introduction to his work, that "his only object was to facilitate to the sovereigns of his age the task of a new legislation," and his strong recommendation to them is to abolish all pernicious or useless laws, and to be sparing in making new ones without a real necessity. Like his contemporary, Beccaria, he adopted the theory then prevailing in France, of an original social contract, by which every individual had resigned for himself and his descendants his right of self-defence which he possessed in a state of nature to the collective body of society, giving it thereby the right of punishing any one who made attempts against the security of another ('Scienza della Legislazione,' 11, 26). This fiction has been since overthrown by other writers, and in Italy especially by Romagnosi in his 'Genesi del diritto Penale,' 1791, and in his 'Assunto primo della Scienza del Diritto Naturale,' 1820. See also on this subject another Italian, Professor Rossi, in his 'Traité de droit Pénal,' Paris, 1835.

On some questions of political economy, on population, agriculture, &c., Filangieri shared the opinions prevalent in his time, which have been since exploded or modified by modern economists. Notwithstanding these and other blemishes, the work of Filangieri has still great merit; it suggests many useful ideas, and is throughout inspired by a sincere love for mankind, and an honest sincerity of purpose. The commentary of Benjamin Constant forms a very useful supplement to it.

FILIPEPI, SANDRO or ALESSANDRO, commonly called Botticelli, from the name of a goldsmith to whom he was apprenticed, was born at Florence in 1437. He studied painting under Filippo Lippi, and became one of the first painters of his time, though his chief excellence was in his invention and expression. He painted many pictures for the churches of Florence, some of which are still preserved, and are now in the gallery of the Florentine Academy. He painted a small picture for the church of Santa Maria Novella, representing the adoration of the kings, in which the kings were portraits of Cosmo, Julian, and Cosmo's son, Giovanni Medici. This was one of Sandro's masterpieces, and was, in the early part of this century, in the possession of Mr. Young Ottley, the author of the 'Inquiry into the early History of Painting.'

Sandro painted also for Sixtus IV., in the Capella Sistina, at Rome, three pictures from the history of Moses and the Israelites—his largest and best works. After the completion of these works he returned to Florence, neglected painting, and gave himself up to Savonarola, and to Dante's 'Inferno,' which he illustrated, and he attempted himself to engrave his designs; it is not known exactly how many he engraved, but those attributed to him are miserably executed; they are however scarce, and fetch very high prices. Nineteen altogether were engraved for an edition of Dante published by Nicolo di Lorenzo at Florence in 1481, but they were nearly all engraved by Baldini from Sandro's designs. [BALDINI, BACCIO.] Sandro, after his connection with Savonarola, neglected his worldly concerns to such a degree that he would probably have starved had it not been for the bounty of

Lorenzo de' Medici; he survived Savonarola many years, and died at Florence in 1515. Filipepi was one of the last of the old Italian or quattrocento school of painting, which passed away at the appearance of the grand works of great cinquecentisti, Da Vinci, Michel Angelo, and Raffaello.

FILLANS, JAMES, sculptor, was born at Wilsontown, Lanarkshire, on the 27th of March, 1803. His father having become reduced in circumstances, removed into Renfrewshire while James was yet a child, and the boy was early set to the keeping of sheep and similar employments, and consequently received scarcely any school education. When old enough he was apprenticed to a weaver at Paisley; but disliking the occupation, was at the end of a year placed with a stone-mason. At this business, after having served his apprenticeship, he for awhile worked as a journeyman. But he had, during his spare hours, even when engaged as a weaver, been teaching himself to draw and to make clay models, and by perseverance he attained sufficient skill to win some local celebrity. Motherwell, the poet, was at this time the editor of the 'Paisley Advertiser,' and he warmly encouraged the young man's tastes, and judiciously guided his aspirations. Fillans found in Paisley, at his moderate prices, patrons for small portraits, busts, and fancy figures; but he determined to try the wider field of Glasgow, as much in order to avail himself of the additional facilities that city afforded for improvement in art, as in the expectation of increased patronage. He however met with both, and after a time was in a condition to visit Paris for the purpose of further study. On his return in 1836 he established himself in London, where he found many warm Scotch friends, among others Allan Cunningham, who sat to him for his bust, and introduced him to Chantrey.

At the exhibition of the Royal Academy in 1837, Fillans had seven busts, including one of Allan Cunningham, which attracted some attention. He now produced a 'Tam o' Shanter jug'; 'The Birth of Burns,' an alto-rilievo, and other designs of a similar kind, forming a Burns series, which have been more than sufficiently praised; and he received a commission for a bust of Mr. Oswald of Auchincruive, for his tenantry, which led him to visit Italy, Mr. Oswald being then resident on the continent. While still depending upon portrait busts for his means of support, Mr. Fillans was not negligent of loftier subjects. His chief work of this order was a life-sized group in marble, 'The Blind Teaching the Blind,' a work of real merit and some originality: it was exhibited in Glasgow, where it produced a great sensation. His 'Boy and Fawn' was another admirable production. But the works which established his fame were his colossal statue of Sir James Shaw, for the baronet's native town of Kilmarnock, and the bust of John Wilson—both characteristic works, that of Wilson being indeed by far the most striking head of the poet which has been produced. In Scotland they were received with enthusiasm, and the sculptor was congratulated with two or three public dinners given in his honour. Still, though so far successful, he found his income insufficient to maintain establishments in London and Glasgow, and he resolved to quit the metropolis, his commissions having been chiefly derived from his countrymen. He removed to Glasgow in 1851, but his health, already impaired, became gradually worse; and at length an attack of rheumatic fever carried him off on the 12th of September 1852. He had been engaged as long as his strength permitted upon a colossal statue of 'Rachel Weeping for her Children,' but left it unfinished.

A life of James Fillans, by James Paterson, was published at Paisley in 1854, in a handsome quarto volume. It contains engravings of his principal statues, of his designs for Motherwell's tomb, the Burns series, an elaborate series of designs of 'Taming the Wild Horse,' and a set of designs illustrative of a tale by a friend. It also contains several pieces of poetry, in which Mr. Paterson finds much to admire, but which would have been as well left in the manuscript, except as evidence of the sculptor's kindheartedness. Fillans used the pencil as well as the chisel, but with by no means equal success.

FILLMORE, MILLARD, late President of the United States of North America, was born on the 7th of January, 1800, at Summer Hill, in the state of New York. His father cultivated a small farm, and Millard Fillmore was apprenticed to a wool-carder, and worked at the trade four years, during which he employed his hours of leisure diligently in supplying the defects of his early education. In the year 1819 the late Judge Wood of Cayuga County, having become acquainted with Fillmore, and observed that he possessed qualities of mind worthy of cultivation, received him into his office, and offered to pay the extra expenses requisite to qualify him for the profession of a lawyer. Fillmore—however, in order to press as lightly as possible on the bounty of his patron, devoted his leisure hours to the teaching of a school. In 1829 he was in successful practice as a lawyer, and had acquired sufficient reputation to be elected a representative of the county of Erie in the State-Assembly of New York. Towards the end of 1832 he was elected a representative to Congress, and took his seat in March 1833. From 1835 to 1837 he continued in the exercise of his profession, but in the latter year he was again elected a member of Congress, and was successively re-elected to the two following congresses. At the termination of the first session of the 27th Congress, he resumed his practice as a lawyer in the city of Buffalo, and informed

his constituents that he should not be a candidate for re-election. In 1844, under the auspices of the Whig party, he stood a contested election for the office of Governor of the State of New York. He was unsuccessful; but in 1847 was elected Controller of the State. In 1848 he was proposed as the Whig candidate for the office of Vice-President of the United States, and was elected. Early in 1849 he resigned his office of Controller, in order to devote himself entirely to his duties as Vice-President. When General Taylor died July 9, 1850, Millard Fillmore succeeded him as President of the United States, according to a law of the Constitution, which provides that, should a President expire while in office, he shall be immediately and without election succeeded by the Vice-President for the remainder of the term of office. Mr. Fillmore ceased to be President on the 3rd of March 1853, when he was succeeded by Franklin Pierce, the present President. He is now (August 1856) a candidate for the presidency.

FINDEN, WILLIAM, line engraver, was born in 1787. He was apprenticed to Mr. Mitton, an engraver of shop-bills, coats of arms, &c., but by devoting his leisure to the study of the works of James Heath, and others, he acquired, by his own industry and intelligence, so much facility in the use of the burin, and displayed so cultivated a taste, that after he began to work on his own account he soon found ample employment in engraving book plates. Among his first successes in this line, his engravings of Smirke's illustrations of 'Don Quixote' have been singled out for special commendation.

Being very industrious, and always remarkable for a certain neatness of line and smoothness of finish, he grew in course of time to be one of the most popular engravers of the day; and he was selected to engrave 'the royal portrait' by Lawrence, of George IV. seated on the sofa. It was a plate of large size, and for engraving it Mr. Finden received the sum, unparalleled for a portrait, of 2000 guineas. Finden bestowed upon it the utmost care, and it was so extremely popular that proofs and prints are said to have been advertised for at a large advance of price. But both the picture and the engraving were in an essentially false style of art, and, the fashion having passed away, they have sunk in general estimation even below their proper level. Among Mr. Finden's other more celebrated large engravings, may be mentioned the 'Village Festival,' from the well known picture by Wilkie, now in the National Gallery, which, with something of effeminacy in the handling, is much his finest engraving; and the 'Highlander's Return,' also after Wilkie.

Still his greatest success had been in small plates, especially in book-plates, and the great request in which he was with publishers, led him to call in the assistance of inferior hands for the completion of his many engagements. To such an extent did he carry this, that he had at length, in conjunction with a younger brother, Mr. Edward Finden, also a skilful engraver, established a complete manufactory for line engravings on steel and copper. The effect was, of course, mischievous to art; injurious to his own reputation, as necessarily tending to destroy individuality of style; and eventually it was ruinous to his fortune, by inducing him to undertake—partly no doubt to keep his establishment in full employment, and partly to secure to himself a share of the profits which he fancied belonged of right to the engraver rather than to the publisher—the publication of various extensive series of engravings. Of these, the first and most successful was the popular 'Byron Gallery.' Other galleries and sets of illustrations followed with less success; and ultimately by far the best of the whole 'the Gallery of British Art'—a generally well-selected, well-engraved, and characteristic series of engravings from our best painters—on a larger and more costly scale than any of his previous speculations, was undertaken at an unfortunate time, and, being persevered in, in hopes of eventually retrieving the first losses, swept away the fruits of all his previous labour.

After this, Mr. Finden's only important work was a large engraving, executed for the Art Union, of Hilton's 'Crucifixion'; but it was the work of a man broken in spirit, and is a very unsatisfactory production. He completed it shortly before his death, which occurred on the 20th of September, 1852.

FIORILLO, JOHANN DOMINIK, a distinguished German painter and author, was born at Hamburg in 1748. He went to Rome in 1761, and was four years the pupil of Pompeo Batoni; he studied also some time at Bologna, where he was elected a member of the academy in 1769. In 1784 he was appointed to the professorship of art in the University of Göttingen, where he died in 1821. He is the author of several essays relative to the history of modern art, but his great work is his history of painting, comprising the 'Geschichte der Malerei' ('History of Painting in Italy, France, Spain, and England'), in five volumes, and the 'Geschichte der Zeichnenden Künste in Deutschland und den Vereinigten Niederlanden' ('History of the Arts of Design in Germany and the United Netherlands'), in four volumes, 8vo. The whole forms a very useful compilation, especially as to the latter centuries of the middle ages; but he has introduced notices of so many artists of utter historical insignificance, that he has not been able to give sufficient space to the important artists, and the first five volumes are a mere chronological series of short biographies. The German portion is a work of great research, merit, and utility, especially where he treats of early times. Fiorillo painted to the last, but he did not execute many pictures: his masterpiece is considered a large picture of 'The Surrender of Briseis to the

Heralds of Agamemnon,' from Homer. (Meusel, *Miscellaneous Artistischen Inhalte*; Nagler, *Künstler-Lexicon*.)

FIRDUSI, ABUL CASIM MANSUR, a celebrated Persian poet, was born at the village of Shadab, in the district of Tus, in the province of Khorassan. The Persian biographers differ considerably in the date of his birth, some placing it in the beginning and others in the middle of the 10th century; but as Firdusi himself mentions in the last chapter of the 'Shah Nameh' that he completed that work A.H. 400 (A.D. 1009), and that he was then nearly eighty, he must have been born about A.H. 319 (A.D. 931).

His father was a gardener, and is said to have had the management of a beautiful estate called Firdus (that is, paradise), whence the poet obtained the name of Firdusi, though, according to another account, this name was given to him by Mahmud in consequence of the excellence of his verses.

Firdusi appears to have spent the first fifty years of his life in his native village; till attracted by the encouragement which Mahmud gave to learning and the fine arts, he repaired to his court at Ghazni, where his talents procured him an honourable reception. Soon after his arrival, Mahmud commanded him to write a history of the kings of Persia in verse, and promised to reward him with a thousand pieces of gold for every thousand couplets. The poet however preferred waiting for his reward till he had finished the work, which was completed, after a labour of thirty years, in 60,000 couplets. But instead of receiving the great sum he had anticipated, he was doomed to a cruel disappointment. It appears that he had offended some favourite courtiers, who prejudiced the mind of Mahmud against him, and accused him of having insulted the religion of the prophet by the praises which he had bestowed upon Zerdusht (Zoroaster) in his great poem. Instigated by these calumnies, Mahmud only sent him 60,000 silver dirhems. It is related that Firdusi was in the bath when the money was brought, and that disappointed and enraged at the meanness of the sultan, he distributed the whole sum among the attendants of the bath and the slave who brought it, adding, "The sultan shall know that I did not bestow the labour of thirty years on a work to be rewarded with dirhems." In consequence of this insult, he was sentenced to be trod to death by an elephant, and with great difficulty obtained a revocation of the sentence. Feeling that he was no longer safe at Ghazni, he left the city, after having written a bitter satire on Mahmud, which he gave to one of the courtiers, telling him that it was a panegyric on the sultan, which he must not present to his master till several days had elapsed. A translation of this satire is given by Sir William Jones, accompanied with the original Persian, in his 'Poëses Asiaticæ Commentarii' ('Works,' 8vo, edition, vol. vi., pp. 303-313), and also without the Persian in his 'Traité sur la Poésie Orientale,' vol. xii., pp. 242-245.

The accounts given in the Persian biographies of Firdusi after his departure from Ghazni are vague and unsatisfactory. The remainder of his life was spent in wandering from one kingdom to another, pursued by the emissaries of Mahmud, whose power was too much dreaded by the various monarchs of the East to allow them to harbour for any length of time the proscribed poet. He first took refuge with the governor of Mazanderan (Hyrkania), and afterwards fled to Baghdad, where he was hospitably received by the kalif, Kadir Billah, who gave him the 60,000 pieces of gold which Mahmud had promised. While at Baghdad he is said to have added 1000 couplets to the 'Shah Nameh,' in praise of the kalif, and also to have written a panegyric on him in Arabic; but this statement is in all probability incorrect, since all trace of the latter is lost, and none of the copies of the 'Shah Nameh,' collated by Mr. Turner Macan, contain the former. During his residence in this city he is also said to have written the poem called 'Joseph,' which consists of 9000 couplets, in the same measure and style as the 'Shah Nameh,' copies of which are now rarely met with even in the East. But even in the capital of the Abbasside kalif he was not secure from the power of Mahmud: the feeble Kadir Billah dared not disobey the commands of the sultan, and the unfortunate poet was obliged to seek in countries still more remote a safer retreat. It is uncertain at what court he next took refuge; but it appears clear from all accounts that his friends procured his pardon shortly after he left Baghdad, and that he eventually returned to his native town, where he died A.H. 411 (A.D. 1020), in the eighty-ninth year of his age. We know little of his family: the death of his son at the age of thirty-seven is pathetically alluded to in the 'Shah Nameh,' and his daughter is said to have refused the 60,000 pieces of gold, which were offered to her by the tardy justice of the sultan.

The 'Shah Nameh' contains the history of the kings of Persia, from the reign of the first king, Kaïumars, to the death of Yezdijird, the last monarch of the Sassanian race, who was deprived of his kingdom A.H. 21 (A.D. 641) by the invasion of the Arabs during the kalifate of Omar. During this period, according to Firdusi, three dynasties sat upon the Persian throne. The first, called the Pishdadian, lasted 2441 years. The second, the Kaianian, commenced with Kaikobad, and lasted 732 years. Alexander the Great, called Sikander by Firdusi, is included in this race, and is represented to be the son of Dârûb, king of Persia, by the daughter of Failakus (Philip of Macedonia). After the death of Sikander, Persia was divided, during 200 years, into a number of petty monarchies called the 'confederacy of

the kings.' The Sassanian race of princes succeeded these, and ruled over the whole of Persia for 501 years.

The poem of Firdusi is of little value as a history, though it certainly contains some of the ancient Persian traditions. The whole history of Kaikhosrau, as related by Firdusi, bears so great a similarity to the account which Herodotus gives of the life of Cyrus, as to put it beyond doubt that both authors present us with a faithful and accurate representation of the same tradition. "It is utterly incredible," says Sir William Jones ('Works,' vol. iii, p. 166), "that two different princes of Persia should each have been born in a foreign and hostile territory; should have been doomed to death in his infancy by his maternal grandfather; should each have been saved by the remorse of his destined murderer; should each, after a similar education among herdsmen as the son of a herdsman, have found means to revisit his paternal dominion, and, having delivered it after a long and triumphant war from a tyrant who had invaded it, should have restored it to the summit of power and magnificence." The leading circumstances in the life of Alexander the Great are also preserved in the 'Shah Nameh.' We read of his victory over Dārā (Darius), of his marriage with Roshung (Roxana), of his expedition into India and defeat of Faūr (Porus), and of his journey through the desert to Mecca to consult two trees from which a voice proceeded, which is evidently only another version of his visit to the temple of Ammon in Libya. The Persian biographers all agree in asserting that Mahmud placed in the hands of Firdusi the ancient chronicles of the kings of Persia, from which it is supposed that he derived the historical narrative extant in his great work. We have the testimony of the book of Esther (x. 2) to the existence of such records, as well as a strong presumption derived from the fragments of Ctesias and many parts of Herodotus. But it appears very unlikely that these chronicles should have been preserved for so many ages, considering the various revolutions which Persia experienced. There is a romantic story told in the preface to the edition of the 'Shah Nameh,' published by the command of Baysinghur Khan, which, though deserving of little credit, must not be omitted on account of its general currency in the East. It is related that Yesdijird, the last monarch of the Sassanian race, ordered all the chronicles of the kings of Persia to be collected and arranged, and that this book was known by the name of the 'Bastan Nameh.' On the conquest of Persia by the Arabs it was found in the library of Yesdijird, and became in the division of the plunder the property of the Ethiopians, by whom it was conveyed to India; it was afterwards taken back again to Persia, where it remained unknown till a fortunate circumstance brought it to light in the reign of Mahmud. Little reliance can be placed on the existence of written documents in the time of Firdusi; the only value of the 'Shah Nameh,' in an historical point of view, consists in the ancient Persian traditions it has preserved; but it would require the learning and acumen of a critic like Niebuhr to arrive at the historical truth conveyed in the tradition, and to strip the real legend of the additions and embellishments of the poet. But it is not as a history that the 'Shah Nameh' derives its reputation. Its poetry is read and admired by all well-educated Persians even in the present day; and its author may be considered as the greatest of oriental poets, with the exception of Valmiki and Kālidāsa. It is written in purer Persian than any other work in the language, and contains a very small number of Arabic words; it has thus become a model of Persian composition, and is as much distinguished in the East as the Homeric poems were in the West.

The copies of the 'Shah Nameh' now met with vary greatly in the number of verses. "It would be difficult to discover," says Mr. Macan in his Preface to the Shah Nameh, "two copies which agree in the order of the verses or in the phraseology for 20 couplets together. Whole episodes are omitted, verses rejected from every page, and it is not now uncommon to find manuscripts which contain only 40,000 couplets, though originally the poem is said to have consisted of 60,000." Mr. Macan adds, that he had never seen a manuscript with more than 56,685 couplets: the edition published by himself contains only 55,204. There have been three attempts made to collate manuscripts of the 'Shah Nameh,' with the view of obtaining an accurate text.

1. The first was made by order of Baysinghur Khan, the grandson of Timur, A.H. 829 (A.D. 1426). The editor states in his preface that Baysinghur took great delight in reading the Shah Nameh, but found so many mistakes in the copies he used, that he ordered a fresh collation to be made in order to obtain an accurate copy for his own private use. The editor does not mention the manuscripts he used; and this collation did not produce much benefit, as the copy was deposited in the king's library, to which no one was allowed access. All trace of it has disappeared; the preface alone is extant.

2. The second collation was made under the superintendence of Dr. Lumsden, professor of Arabic and Persian in the College of Fort William. Twenty-seven valuable manuscripts were procured for this purpose; and the first volume, containing an eighth part of the work, was published at Calcutta in 1811.

3. The third collation was made by Mr. Turner Macan from seventeen complete manuscripts and four fragments containing the greater part of the work; all of which were written in Persian. The whole of the 'Shah Nameh' was published by him at Calcutta, 1829, in 4 vols.

8vo; this edition was printed at the expense of Nuseer-odeen-Hyder, one of the native princes of Hindustan.

An epitome of the 'Shah Nameh' in Persian, made in 1657, by Shumshir Khan, is widely circulated in the East. There is also an abridgment of it in English, in prose and verse, by Mr. James Atkinson, London, 8vo, 1833; the same author had previously published at Calcutta in 1814, the episode of Sohrāb in English verse, accompanied with the Persian text. The entire poem was translated into Arabic prose, A.H. 675 (A.D. 1277), by Caouām-ēddyn-Abul-Feteh-Isa, a native of Ispahan. A small portion of it was published by Wahl in the original Persian, with a German translation and many valuable notes in the fifth volume of the 'Fundgruben des Orients,' Wien., 1816 (pp. 109-131, 233-264, 351-389); which was reprinted by Vuillers in a useful work for beginners, entitled 'Chrestomathia Schahnamiāna,' Bonn, 1833. The first eight books were translated by Champion in 1 vol. 4to, 1784; and a few extracts were also translated into English verse by Stephen Weston, B.D., Lond., 1815. Further particulars of the life of Firdusi will be found in Silvestre de Sacy's translation of his life by Daulat Shah; published in the fourth volume of 'Notices et Extr. des Manuscrits' (pp. 203-238), and in the prefaces to the various works quoted above.

FIRENZUOLA, A'GNOLO, was born September 28, 1493, in the city of Firenze (Florence). He was christened Michelagnolo Girolamo, but his name was afterwards contracted to Agnolo. The family name was taken from the small town of Firenzuola, in Tuscany, between Florence and Bologna, in a valley among the Apennines, near the source of the Santerno. Negri, Nicéron, and others who have followed them, appear to have been mistaken in stating that the family name was Nannini. Agnolo's father, Bastiano Giovannini da Firenzuola, and his grandfather Carlo da Firenzuola, were citizens of Firenze, and both of them held offices of trust in the city under the patronage of Cosmo de' Medici.

Agnolo Firenzuola lived in his native city till the age of sixteen, when he went to Siena, where he studied law with much labour but little satisfaction to himself; he also studied at Perugia, and practised for a short time as an advocate at Rome. While yet a young man he left the law for the church, assumed the habit of the monks of Valmorbosa, and in 1525 was elected abbot of the monastery of Santa Maria Ermita, at Spoleto. He was afterwards appointed abbot of San Salvatore, at Prato, where he chiefly resided during the rest of his short life. The year of his death is not known, but it was probably about 1542 or 1548, since he dates the dedication of his 'Discorsi degli Animal' on the 9th of December 1541, and Lorenzo Scala, who published the work in 1548, speaks of his death as having occurred a few years before 1548. Tiraboschi doubts if Firenzuola ever was an abbot, but gives no reason for disputing the authority of other writers as well as of documents, than that his life was not sufficiently pure for the sacred office: a very insufficient reason as applied to the dignitaries of the Church of Rome in those times. Scala calls him "Il Reverendo Abate Messer Agnolo Firenzuola;" and addressing himself to Pandolfo Pucci, speaks of Agnolo as his "caro e virtuoso amico" (his dear and virtuous friend).

His works were published in 1548, as already stated, partly by Lorenzo Scala and partly by Carlo Firenzuola, Agnolo's brother: they consist of 'Discorsi degli Animal'; 'Ragionamenti'; 'Novelle'; 'Epistola in Lode delle Donne'; 'Dialogo delle Bellezze delle Donne'; 'Discacciamento delle Nuove Lettere'; two comedies, 'I Lucidi' and 'La Trinzuzia'; 'Asino d'Oro d'Apulejo rifatto in Lingua Fiorentina,' and 'Rime.'

Firenzuola is entitled to a high place among the early Italian writers. His works have been frequently reprinted, both separately and collectively, and are still much read. His two comedies, regarded merely as specimens of dramatic dialogue, are not surpassed by anything in the language. He has less power and originality of imagination than Ariosto, Machiavelli, and Divizio (Cardinal Bibbiena), who immediately preceded him, and Gelli, who was his contemporary; but his dialogue is always natural, spirited, appropriate to the characters, and in purity of idiomatic Tuscan is unsurpassed by any other Italian author. He is one of the "testi di lingua," or writers of the highest authority in the language, and as such is frequently quoted in the 'Vocabolario' of the Academy della Crusca. 'I Lucidi' is an adaptation of the 'Menæchmi' of Plautus, but the plot of 'La Trinzuzia' (Triple Marriage) appears to have been invented by himself, except that the character of Rovino seems to have been modelled on that of Calandro, in the 'Calandria' of Cardinal Bibbiena. Firenzuola's two plays are free from the indecencies which pollute his 'Novelle.' They are printed in the second edition of Biagioli's collection of Italian classic writers, 'Tesoretto della Lingua Toscana,' Paris, 8vo, 1822, with copious notes in French explanatory of the difficult idioms.

The 'Novelle,' of which there are ten, are short tales in the manner of Boccaccio, inferior in invention and perhaps in descriptive power, but of equal elegance of narrative and dialogue; some of them however are little less licentious than many of those of Boccaccio himself.

Firenzuola's version of the 'Golden Ass' of Apuleius is partly adapted and partly translated. The time is changed from the 2nd century to the 15th; the Greek towns are converted into Italian towns,

and the Lucius of the original work becomes Agnolo in the version. The leading circumstances are retained, but altered as far as is necessary to suit the change of time and country; the alteration however is by no means an improvement of the original narrative, though the composition, as a specimen of Italian prose, is admirable.

Firenzuola's other prose works, which are mostly in the form of dialogue, are delightfully written; his 'Dialogo delle Bellezze delle Donne' especially, abounds in descriptions of exceeding delicacy, conveyed in a style so graceful and flowing as to give to a series of remarks all the attraction of an interesting narrative. The 'Disaccigliamento' was written in opposition to the party who were then attempting to introduce certain letters not previously in use into the Florentine alphabet, such as the letter K. Firenzuola, in a sonnet, addresses the literary reformers as "kandidi ingegni."

As a writer of verse Firenzuola has considerable merit; his sonnets indeed are less delicate in thought and expression than those of Petrarch, but his satirical verses are of a high class, very effective, and in elegance and facility hardly inferior to those of Berni.

(*Vita di Agnolo Firenzuola*, prefixed to his *Opere*, Pisa, 6 vols. 18mo, 1816; Ginguené, in *Biographie Universelle*; Tiraboschi, *Storia della Letteratura Italiana*.)

FISCHER, KARL VON, founder of the Munich school of architecture, was born at Mannheim, September 19, 1782; and at the age of fourteen was placed by his father, Hofrath von Fischer, who had observed in him an unusual inclination for drawing buildings, with Oberbaudirector Verschaffelt, a man of great ability in his profession. On Verschaffelt's removing to Vienna in consequence of being employed by Prince Esterházy, Fischer accompanied him thither, and remained in that capital from 1801 to 1806; and besides the advantage he derived from studying there at the Academy of Fine Arts, acquired much practical experience, being intrusted by Verschaffelt with the superintendence of some of the buildings he was engaged upon. It was while he was at Vienna that he first projected what afterwards became his greatest work, for, having made designs for an opera-house, and also for another theatre, which excited much admiration, he was commissioned to modify the plan of the latter so as to adapt it for the new 'Hof Theatre' which it was intended to erect at Munich. The scheme however was dropped for a time; and on quitting Vienna, Fischer visited France first, afterwards Italy, where he spent about two years, diligently studying all the most remarkable examples of architecture. On his return to Germany in 1809, he went to Munich, where he was made Professor of Architecture at the Academy, of which office he continued up to the time of his death, to discharge the duties with equal zeal and ability: it was in consequence of his strongly urging it, that the academy began to form a collection of architectural casts and models.

One of the first buildings erected by him at Munich was the mansion for the minister Salabert, at the entrance to the 'English Garden,' which was afterwards occupied by Prince Karl, and then called the 'Pavillon Royal.' When the Karoline-Platz and Maximilian Vorstadt were first laid out in 1810, he built fourteen of the principal mansions and houses in that quarter, introducing a nobler style of architecture than had hitherto been employed in constructions of that class. Among other private residences and hotels by him, the most remarkable are those for the then Crown-Prince of Bavaria, Baron von Asbeck, Count Pappenheim, and Baron von Zentner. The façade of the 'Ministerialgebäude des Innern,' or Home-office;—the Auger-kirche and General Hospital were also by him. All these however were but minor works in comparison with the Hof Theatre, which is still one of the principal ornaments of Munich, though no longer made use of as the court theatre, a larger building adjoining it being now the principal theatre of Munich. The Hof Theatre was begun in 1811, and first opened October 12th, 1818, but it was nearly consumed by fire in 1823; it was however rebuilt the following year, according to the original designs. Plans, sections, and other drawings, fully illustrating this edifice, may be found in Förster's 'Bauzeitung' for 1841. Fischer did not live to learn the fate of his great structure, as he died, after several months' severe suffering from a pulmonary disorder, February 11th, 1820.

FISCHER VON ERLACH, JOHANN BERNHARD, and his son Joseph Emmanuel, both distinguished architects, designed or superintended the building of all the principal public or private edifices which were erected at Vienna in their time. Johann the father was born either at Prague or Vienna in 1650, and studied under Bernini at Rome, and all his works are in the style of that architect. His first work was the palace of Schönbrunn, commenced in 1696 for Joseph I., to whom, and Charles VI., he was court architect; he died in 1724.

JOSEPH EMMANUEL, BARON VON ERLACH, was born in 1680. He finished the works which his father left incomplete, the principal of which is the magnificent church of St. Karl Borromæus, finished in 1737. He was created Baron von Erlach by Charles VI. The year of his death is not known, though it was after 1740. He was the first to introduce the steam-engine into Germany.

(*Austrian National Encyclopædie*, 1836, il. 147.)

FISHER, JOHN, Bishop of Rochester, was born at Beverley in 1456. He was educated at the collegiate school of his native place, and after some residence there removed to Michael House College, Cambridge,

of which he became master in 1495. The respect in which Margaret countess of Richmond, Henry VII.'s mother, held his character, and her high opinion of his learning, induced her to appoint him her chaplain and confessor. He was named the first 'Lady Margaret's Professor of Divinity' in the University of Cambridge, and became Bishop of Rochester in 1504. It was some years after this time that the actions of Bishop Fisher gained him an historical notoriety. When Henry VIII. (1527) was anxious to prove both to himself and to others the illegality of his marriage with Catherine of Arragon, he applied to the bishops for their opinions in the matter. Of all the bishops Fisher alone refused to sign a declaration that the marriage was unlawful. Other persons indeed affixed his signature to the paper, affirming that they had his permission to do so; but the bishop resolutely denied that he had given them his consent; for in his conscience he believed the marriage to be valid. This refusal, and his continued advocacy of Queen Catherine's cause, made him many powerful and lasting enemies. Not only did he become hateful to the king, who was desirous for the divorce, but the whole parliament took umbrage at his conduct. Sir Thomas Audley, then speaker, and thirty members of the House of Commons, were sent to complain to the king of certain derogatory words which Fisher was declared to have used respecting the assembled representatives; and it was with difficulty that he could persuade them to receive his explanation. Four years after, when both the parliament and the convocation were in debate upon the expediency of denying the pope's supremacy (1534), Fisher again stood alone. He dissented from all the other bishops, and could not, either by persuasion or argument, be induced to concur with their opinion. An event was now at hand which laid the foundation of his ruin. The imposture of Elizabeth Barton, the nun of Kent, was exposed by the diligence of Crammer and others; and while the principal agents were condemned to death, it was very properly deemed fit that those who had been privy to the deception should not escape unpunished. Among these was Fisher, who, knowing this woman and her associates to be impostors, disgraced himself by not exposing the imposition. He made many vain excuses, but was found guilty of misprison of treason. It does not appear that the king proceeded against him upon this charge till he was moved by new provocations. When the oath touching the succession and the king's supremacy was offered to him, the Bishop of Rochester, as Sir Thomas More had done, refused to swear it. The king, now more than ever irritated against him, caused him to be indicted upon the statute and committed to the Tower: "his bishoprick was seized," says Burnet ('Hist. Reformation,' vol. i.), "and all his goods taken from him; only some old rags were left to cover him; and he was neither supplied well in diet nor other necessaries, of which he made sad complaints." Books were also denied him lest he should write against the king's marriage or supremacy. These inexcusable severities met with the most bitter censure of the Roman Catholic party; while many of the Reformers, especially the Lutheran preachers who had frequently been persecuted by Fisher, are said to have privately rejoiced in his misfortunes. During his imprisonment Pope Clement, in spite to the king, and in kindness to Fisher, sent him a cardinal's hat. When the king heard of this, he desired that the bishop might be examined about it; but Fisher protested that he had used no endeavours to procure it; nevertheless his new dignity precipitated his ruin. His continued denial of the king's supremacy was no longer passed over: on the 17th of June 1535, he was called to account for this offence. The Lord Chancellor, the Duke of Suffolk, and some other lords, together with the judges, were appointed commissioners for his trial; he was found guilty, and condemned to die as a traitor. On the 22nd of June he was beheaded.

The character of Fisher is remarkable for firmness. In his steady maintenance of the fallen cause of Queen Catherine, undaunted by the anger of the vindictive king, this quality peculiarly shone forth: and still more with regard to the oath of supremacy, refusal to take which was certain to call forth severe punishment, and in all probability death. Fisher was immovable, not being convinced that he was in the wrong; his fearless firmness allowed him to maintain an open profession that he was in the right. He was a learned and devout man, and his conduct fully proved his sincerity.

FITZHERBERT, MARIA, was the youngest daughter of Waller Snythe, Esq., of Brambridge, Hants, second son of Sir John Snythe, third baronet, of Eshe, Durham, and Acton Burnel, Salop. She was born in July 1756, and in 1775 became the wife of Edward Weld, Esq., of Lulworth Castle, Dorset, who died the same year. In 1778 she remarried Thomas Fitzherbert, Esq., of Swinnerton, county of Stafford, but was again left a widow in 1781, when she was scarcely twenty-five years of age. In 1785 she first became acquainted with King George IV., then Prince of Wales, to whom she was privately married on December 21st of the same year, the ceremony being performed at Carlton House by a Protestant clergyman, in the presence of her uncle and brother. This union was invalid as to its civil effects, as being contrary to the act which forbade, and still forbids a union between the subject and a prince of the blood royal: while further, the marriage of a royal prince with a Roman Catholic is sufficient in point of law to exclude him from succession to the throne. Subsequently however the prince contracted a marriage according to the laws of England with the Princess Caroline of Brunswick; but

his attachment to that princess speedily failing, Mrs. Fitzherbert returned to the prince, under the advice of the Roman see, and again lived with him for several years as his wife. The irregularities of the prince however eventually drove her into retirement, and she spent the last years of her life at Brighton, enjoying the respect and good opinion of King George III., King William IV., and the whole of the Royal family, and dispensing a large income in numerous charities. She refused the offer of a peerage upon more than one occasion. She died at Brighton March 29, 1837, and was buried in the Roman Catholic Chapel of that town, where a monument was erected to her memory by her adopted child, the orphan daughter of Lady Horatia Seymour.

(Lord Holland, *Memoirs of the Whig Party*, 1855; Hon. C. Langdale, *Memoirs of Mrs. Fitzherbert*, 1856.)

FITZJAMES. [BERWICK, DUKE OF.]

* FITZ-ROY, CAPTAIN ROBERT, R.N., was born in June 1805, and is the second son of General Lord Charles Fitz-Roy, who died December 20, 1829. He entered the navy October 19, 1819, and obtained his first commission September 7, 1824. He served in the *Thetis* frigate on the Mediterranean and South American stations. The charts of the coasts of South America having been found to be very imperfect, and in many instances erroneous, the French and English governments undertook, for the benefit of the mercantile world, to explore and survey those coasts, the French undertaking to examine the shores of Brazil, and the English those of Patagonia, Tierra del Fuego, Chili, and Peru. In 1825 two vessels were ordered to be fitted out for this purpose, the *Adventure*, 330 tons, and the *Beagle*, 235 tons. Captain Philip Parker King was appointed to the direction of the expedition, and the command of the *Adventure*; Captain Pringle Stokes to the command of the *Beagle*. The expedition sailed from England in May 1826. Captain Stokes died in 1828, and the *Beagle* was temporarily commanded by Lieutenant Skyring, but in December of that year Rear-Admiral Sir Robert Otway, commander-in-chief on the Rio Janeiro station, appointed Captain Fitz-Roy to the command of the *Beagle*, with Lieutenant Skyring as his assistant-surveyor. After four years of unremitting labour the *Adventure* and *Beagle* sailed together from Rio Janeiro August 6, 1830, on their return, and anchored in Plymouth Sound, October 14.

In the '*Journal of the Royal Geographical Society*,' vol. i., p. 155, &c., are 'Some Observations upon the Geography of the Southern Extremity of South America, Tierra del Fuego, and the Strait of Magalhaens, made during the late Survey of those Coasts, in his Majesty's Ships *Adventure* and *Beagle*, between the years 1826 and 1830; by Captain Philip Parker King, F.R.S., &c., and Commander of the Expedition.' Read 25th April, and 9th May 1831. Captain King, in this paper, mentions the discovery, by Captain Fitz-Roy, in the Strait of Magalhaens, of a large inland sea, fifty miles long, which was named the Otway Water, and which is connected by a channel, called the Fitz-Roy Channel, with another large salt-water lake, which was named Skyring Water.

In the year 1831 the *Beagle* was prepared for another surveying voyage, and on the 27th of November 1831 set sail from Plymouth, well manned, well appointed, and well provided, with Captain Fitz-Roy for commander, and Mr. Charles Darwin as naturalist. Having circumnavigated the globe, and accomplished as far as practicable all the objects which the expedition had in view, the *Beagle* cast anchor at Falmouth, October 2, 1836, having been absent four years and ten months.

In the year 1839 the two following works were published:—'*Narrative of the Surveying Voyages of H.M.S. Adventure and Beagle between the years 1826 and 1836, describing their Examination of the Southern Shores of South America, and the Beagle's Circumnavigation of the Globe*,' 2 vols. 8vo, London, written by Captain Fitzroy, in conjunction with Captain King. '*Journal of Researches into the Geology and Natural History of the various Countries visited by H.M.S. Beagle, under the command of Captain Fitz-Roy, from 1832 to 1836*,' by Charles Darwin, Esq., M.A., F.R.S., Secretary to the Geological Society, 8vo, London. On this work the President of the Geological Society made the following remark: "Looking at the general mass of Mr. Darwin's results, I cannot help considering his voyage round the world as one of the most important events for geology which has occurred for many years."

Captain Robert Fitz-Roy in 1841 sat as M.P. for the city of Durham. On the 21st of September 1842 he was appointed acting conservator of the River Mersey. On the 3rd of April 1843 he became governor and commander-in-chief of the colony of New Zealand. In 1846 Mr. Grey (now Sir George Grey) succeeded him as governor of New Zealand. In the same year Captain Fitz-Roy published a pamphlet in justification of his government of the colony, intitled, '*Remarks on New Zealand in February, 1846*.' In 1850 he published '*Sailing Directions for South America*, by Captains Philip Parker King and Robert Fitz-Roy, Royal Navy,' consisting of charts and an 8vo volume. The volume is chiefly from the pen of Captain Fitz-Roy, and the charts which accompany it are the results of his surveys.

Captain Fitz-Roy married December 8, 1836, and has issue.

FITZSTEPHEN, WILLIAM, author of the earliest description of London extant, was of Norman extraction, but born in the metropolis. He became a monk of Canterbury, and was much connected with

Archbishop Becket; he was one of his clerks, and an inmate in his family, filling different offices at different times in his train and household. He continued with the archbishop after his other clerks and servants had deserted him, and was also an eye-witness of his murder at Canterbury. Fitzstephen is supposed to have died in 1191. His '*Description of the City of London*' was part of another work, '*The Life and Passion of Archbishop Becket*.' The description of London was probably written towards the end of the reign of Henry II. (who died in 1189); but in the carefully collated text of Fitzstephen in Mr. Thoms's edition of Stow, among the "illustrious and august princes" which "London in modern times has produced," '*Henricum regem tertium*' is named. This of course would make the '*Description*' to be of at least some thirty years later date than is usually assigned to its composition, and Fitzstephen to have been living at a correspondingly later period. But it is probably the error of a copyist who has inserted the name of the third in the place of the second Henry. The description is one of the oldest and most remarkable mediæval notices of any European capital. It was accordingly noticed by Leland and Stow, the latter of whom inserted a translation of it in his '*Survey of London*.' Dr. Pegge in 1772 published Fitzstephen's original text, with a more accurate translation and notes; and Mr. Thoms, in his edition of Stow's '*Survey of London*,' 1843, inserted a collated version of the original text with a revised translation. This is the best edition. Fitzstephen, if we may judge from his quotations, was well versed in the Latin, and had looked into some of the Greek classics. There is a fine manuscript of Fitzstephen's history among the Lansdowne volumes (No. 398) in the British Museum—that employed by Mr. Thoms; and a fragment of another copy among the manuscripts of the late Francis Douce, Esq., in the Bodleian.

FLACCUS, CAIUS VALE'RIUS, was born at Padua according to some, or at Setia in Latium according to others, who ground their opinion chiefly on the names of Setinus Balbus, which are found added to his other names in some manuscripts of the '*Argonautica*.' Some however have supposed that Setinus Balbus was merely a transcriber or reviser of the poem. Flaccus lived under Vespasian, and was a contemporary of Martial, who addressed to him one of his epigrams, inviting him to abandon poetry for the bar, as a surer means of making his fortune. He seems to have died young at Padua; and Quintilian speaks of his death as a loss to literature. He wrote his '*Argonautica*' in imitation of Apollonius. The poem is full of digressions and episodes, amidst which the main action languishes, and is often lost sight of. Some of the descriptions however are remarkably fine and poetical; and it is observed that Flaccus is more elegant in those parts of the poem which are of his own invention than in those which he has borrowed or imitated from Apollonius. His style is at times obscure, and he is very fond of displaying his erudition, which is often out of place. We have only eight books or cantos of his '*Argonautica*,' the last of which is incomplete; the whole poem is supposed to have consisted of ten or twelve cantos. This poem was first discovered by Poggio Bracciolini in the convent of St. Gall. G. B. Pio published in 1519 an edition of it, adding the termination of the eighth canto as well as the ninth and tenth cantos of his own composition. It has been translated into most of the modern languages of Europe.

FLAMININUS, TITUS QUINTIUS, was made consul, B.C. 198, before he was thirty years of age, and had the province of Macedonia assigned to him, with the charge of continuing the war against Philip, which had now lasted for two years without any definitive success on the part of the Romans. Flamininus having landed in Epirus, opposite the island of Corcyra, with a reinforcement of 8000 foot and 800 horse, marched up the country, where he found Philip posted in a rugged pass on the banks of the Aous, among the mountains of Eastern Epirus. After some fruitless negotiations with the king of Macedonia, the Romans, under the guidance of an Epirote shepherd, attained by a mountain path the rear of the Macedonian position, and Philip was obliged to make a hurried retreat across the chain of Pindus into Thessaly. He was followed by the Romans and their allies, the Ætolians and the Athamanians, who overran and ravaged the country. Meantime L. Quintius Flamininus, the brother of the consul, sailed with a fleet to the eastern coast of Greece, where, being joined by the ships of the Rhodians and of Attalus of Pergamus, he scoured the coasts of Eubœa, Corinth, and other districts which were allied or subject to the king of Macedonia. The consul himself marched into Phocis, where he took Elatea, and having there fixed his winter-quarters, he succeeded in detaching the Achæans from the Macedonian alliance. In the following year Flamininus, being confirmed by the senate in his command as proconsul, before beginning hostilities afresh held a conference with Philip on the coast of the Malæa Gulf, and allowed him to send legates to Rome to negotiate a peace. The senate however having required the king to evacuate all the towns of Greece which he had occupied, including Demetrias in Thessaly, Chalcis in Eubœa, and Corinth, the negotiations were broken off and Flamininus resumed military operations. He marched from Phocis into Thessaly, where Philip was stationed near Larissa with a body of 16,000 phalanx men, 2000 peltasts, and 5000 Thracian and other auxiliaries. After some previous demonstrations and partial attacks, the two armies met between Phœæ and Larissa, in a country broken

by small hills called Cynoscephalm, or Dogs' Heads. The Macedonians had at first some advantage, especially on the right wing where the king commanded in person, and where he had formed his phalanx on a hill, but Flaminius observing the left wing moving in column with a narrow front to their assigned post, attacked it with his elephants and threw them into confusion before they had time to form. In the pursuit of this body a tribune of the victorious legion being led beyond the flank of the right wing, ventured to attack it on the rear, and he succeeded in spreading disorder into the ranks of the close and cumbersome phalanx. Panic pervaded the Macedonians; many threw down their arms and fled, and Philip himself, seeing the rout becoming general, left the field, and rode off towards Tempe. The Macedonians lost 5000 killed and 5000 prisoners on that day. Soon afterwards the king asked for a truce, which was granted by Flaminius, in order that messengers might be sent to Rome to treat of peace. The senate appointed ten legates, who, in concert with Flaminius, drew up the conditions, which were that Philip should evacuate every Grecian town and fortress beyond the limits of his paternal kingdom, that he should give up all his ships of war, reduce his military establishment, and pay 1000 talents for the expenses of the war. Flaminius was then continued in his command for another year, B.C. 196, to see these conditions executed. In that year, at the meeting of the Isthmian games, where multitudes had assembled from every part of Greece, Flaminius caused a crier to proclaim "that the senate and people of Rome and their commander Titus Quintius, having subdued Philip and the Macedonians, restored the Corinthians, Phocians, Locrans, Eubceans, Thessalians, Phthiotæ, Magnets, Perrhasii, and Achæans to their freedom and independence, and to the enjoyment of their own laws." Bursts of acclamation followed this proclamation, and the crowd pressed forward to express their gratitude to Flaminius, whose conduct throughout those memorable transactions was marked with a wisdom, moderation, and liberality seldom found united in a victorious Roman general. He checked by his firmness the turbulence of his Ætolian allies, who vociferated for the entire destruction of Philip, while he satisfied all just claims of the rest; and although his Macedonian expedition led ultimately to the entire subjugation of both Macedonia and Greece, yet he was at the time the means of restoring peace to both countries, and of protracting the independence of the Greek states for half a century longer.

In the following year, B.C. 195, Flaminius was entrusted with the war against Nabis, tyrant of Lacedæmon, who had treacherously seized the city of Argos. Flaminius advanced into Laconia and laid siege to Sparta, but he met with a brave resistance, and at last agreed to grant peace to Nabis on condition that he should give up Argos and all the other places which he had usurped, and restore the descendants of the Messenians to their lands. His motives for granting peace to Nabis were, he said, partly to prevent the destruction of one of the most illustrious of the Greek cities, and partly because of the great preparations which Antiochus, king of Syria, was then making on the coast of Asia. Livy suggests, as another probable reason, that Flaminius wished to terminate the war himself, and not to give time to a new consul to supersede him in his command and reap the honours of the victory. The senate confirmed the peace with Nabis, and in the following year, B.C. 194, Flaminius having settled the affairs of Greece prepared to return to Italy. Having repaired to Corinth, where deputations from all the Grecian cities had assembled, he took a friendly leave of them, signifying to them that he was going to withdraw all his army and garrisons, and leave them to themselves; advising them at the same time to make a temperate use of that liberty which the Romans had been the means of restoring to them, and above all to preserve concord in their councils, as civil factions would certainly lead to the loss of their independence; for those who find themselves the weaker at home are apt to apply to strangers for support. He accordingly delivered the citadel of Corinth to the Achæans, withdrew his garrisons from Demetrias, Chalcis, and the other towns of Eubœa, and having broken up his camp at Elateæ in Phocis, he sent the soldiers to embark on the coast of Epirus, whilst he repaired to Thessaly to settle the internal affairs of that country, which were in a state of great confusion. He organised the various towns, choosing the magistrates and senate from among the wealthier class. He then repaired to Orizum, on the coast of Epirus, where he embarked for Brundisium. In Italy both he and his soldiers were received with great demonstrations of joy, and the senate decreed him a triumph of three days. On the first day were displayed the arms and the statues of brass and marble taken from the enemy; on the second the silver and gold, whether coined or in vases, shields, and various ornaments; and on the third the golden crowns, the gift of the liberated cities. Before the car of Flaminius appeared the captives and hostages, and among the latter Demetrius, son of Philip, and Armenes, son of Nabis, and in the rear followed the Roman prisoners who had been sold as slaves to the Greeks by Hannibal during the second Punic war, and whose liberation Flaminius had obtained from the gratitude of the Greek states. The Achæans alone are said to have liberated 1200, for whom they paid 100 talents as compensation money to their masters. Altogether there never was perhaps a Roman triumph so satisfactory as this to all parties, and so little offensive to the feelings of humanity. In the year B.C. 183, Flaminius was sent to Prusias, king of Bithynia, upon the dishonourable mission of demanding the person of Hannibal,

then, in his old age, a refugee at the court of Prusias. Hannibal however, by taking poison, avoided being given up. In B.C. 166 Flaminius was made augur in the room of C. Claudius deceased (Livy, xlv. 44), after which he is no longer mentioned in history.

FLAMSTEED, JOHN. The life of the first astronomer royal was known to the world chiefly by the results of his labours, until the year 1832, since which time his private affairs have been brought to light in an unexpected manner, and have excited great interest, not without creating some party feeling among those who cultivate the sciences connected with astronomy. In 1832 Mr. Francis Baily discovered that a considerable collection of Flamsteed's letters was in the hands of a private individual; which, on being examined, was found to contain much that was not generally known. On searching the observatory at Greenwich, Mr. Baily found a vast mass of manuscript observations, letters, and other documents, in the handwriting of Flamsteed and his friends, containing the curious history of which we shall give a brief abstract. The result of this discovery was a representation to the Board of Visitors of the Royal Observatory, who recommended the republication of the 'British Catalogue,' with extracts from the papers of Flamsteed. The Lords of the Admiralty having decided to print this at the public expense, Mr. Baily undertook the preparation of the work, which appeared in 1835, under the title of 'An Account of the Rev. John Flamsteed, &c. &c., to which is added his British Catalogue of Stars, corrected and enlarged.' From this work, which is certainly the most remarkable scientific biography of the present century, we have given Flamsteed's view of his own case. The original account is in part drawn by Mr. Baily from a manuscript by Flamsteed, headed 'Self Inspections, by J. F.,' which is a very interesting autobiography.

John Flamsteed was born at Denby, near Derby, August 19, 1646. His father was in some business, it has been said that of a maltster; he lost his mother when very young. At the age of fourteen he caught cold while bathing, which produced a weakness in the joints, from which he never recovered. He began his mathematical and astronomical studies at a very early age, and showed talents for constructing astronomical instruments. In 1665 he visited Ireland for the purpose of consulting a Mr. Greatrakes, who professed to cure disorders by the touch, and of whose experiments in London a curious account exists. [BOYLE, ROBERT.] No effect being produced on him by this treatment, he returned to Derby, where his father lived, and where he had received his education. Here he continued his studies till 1669, and with great success. In or before 1667 he discovered the real causes of the equation of time, and wrote a tract on the subject, which was afterwards appended by Dr. Wallis to his edition of the works of Horrox, published in 1673. In 1669 he made an astronomical communication to the Royal Society through Oldenburg, their secretary, concealing his name under the anagram

J. Matheain a Sole fundes,

which, being transposed, gives

Johannes Flamsteedius:

this same anagram appears in the title-page of the tables appended to the doctrine of the sphere in Sir Jonas Moore's system of mathematics, in the preparation of which Flamsteed had a share. An answer from Oldenburg, addressed to himself, showed him that he was discovered, and from that time, or rather from the date of a visit which he very shortly afterwards paid to London, he was in correspondence with many scientific men, but particularly with Sir Jonas Moore, who, in 1674, proposed to establish Flamsteed in a private observatory, which he intended to build at Chelsea. In the meantime however the fact of the very large errors to which astronomical tables were subject came to the notice of Charles II., on the occasion of a proposal made by a French gentleman for finding the longitude, and that king determined to establish an observatory. Flamsteed was appointed astronomer royal, or, as the warrant ran, "astronomical observator," and carried on his observations at the queen's house, in Greenwich Park, until the observatory was ready, which was in July 1676. From this time Mr. Baily dates the commencement of modern astronomy; nor can such chronology be disputed if we consider that we now return to Flamsteed's observations as the earliest with which it is desirable to compare those of our day, and also that Flamsteed's catalogue is the first which attained a precision comparable to that of later times. Flamsteed was in fact Tycho Brahé with a telescope: there was the same capability of adapting instrumental means, the same sense of the inadequacy of existing tables, the same long-continued perseverance in actual observation. But Tycho Brahé, a rich noble, found his exchequer in a king's purse; while Flamsteed, a poor clergyman, defrayed the expenses of his instruments himself, upon an ill-paid salary of 100*l.* a year. Up to the year 1684 he had imposed on him the task of instructing two boys from Christ's Hospital, as one of the duties of his post; and, besides this, he was obliged to have recourse to private teaching, to meet the charges of carrying on his observations. At the very same time, that part of the public which cared about the matter were beginning to require that he should print his observations.

Almost at the outset of his labours he was so well known that Dr. Bernard invited him to become a candidate for the Savilian pro-

fessorship of geometry at Oxford, which he declined to do. He had at this time nothing but a sextant and clocks of Sir Jonas Moore's, and some instruments of his own. He borrowed some from the Royal Society, and after repeatedly urging the government to provide him with an instrument fixed in the meridian, he caused a mural arc to be constructed at his own expense, which was erected in the year 1683, but proved a failure.

In the meantime he had taken orders, in 1675, having in the previous year obtained the degree of Master of Arts from Cambridge. It is not certainly known that he had been a student in that university, though it is certain that he was for some months at Cambridge in 1674. Perhaps he obtained his degree by the celebrity of his name, on condition of a short residence.

In 1684 his father died, and he was presented to a small living by the Lord-Keeper North. Both circumstances increasing his means, he resolved to be at the expense of a new mural arc, upon an assurance from the government (which was never fulfilled) that the outlay should be repaid. This instrument was first used in September 1689, and from that moment "everything which Flamsteed did, every observation which he made, assumed a tangible and permanent form, and was available to some useful purpose." When he died, the government of the day attempted to claim these instruments as public property.

The public career of Flamsteed, from this time to the end of his life, is described when we say that he collected that enormous mass of observations which furnished the first trustworthy catalogue of the fixed stars; that he made those lunar observations on which Newton depended for the illustration and verification of his lunar theory; and that he originated and practised methods of observing which may be said to form the basis of those employed at the present time. Were it not for the celebrated quarrel between him on the one side, and Newton and Halley on the other, there would hardly be a life of so much utility as that of Flamsteed, which would afford so little materials for a popular account. It is to be remembered that the following is an *ex parte* statement; but on the other hand, it is not one formally drawn up for the public, but partly contained in the manuscript autobiography which never was published by Flamsteed, and partly derived from his correspondence with his friends. Newton had been on terms of cordial intimacy with Flamsteed, but a coolness had begun to exist in 1696, for which Mr. Baily is unable to account. Sir D. Brewster, in his 'Life of Sir Isaac Newton,' having had access to a number of letters between Flamsteed and Newton, explains this. While Newton was engaged on his Lunar theory, he required observations of the moon's places. For this object he visited Flamsteed at the Greenwich Observatory on September 1, 1694, who gave him 160 places, and promised him more, on condition that he should show them to no one else, and should communicate the results, in the first instance, to Flamsteed only. Letters passed—Flamsteed communicating observations, and Newton returning a table of refractions, tables of horizontal parallaxes, and equations for the apogee, and eccentricity, but with little outbreaks of temper on both sides; Newton evidently considering that Flamsteed was not sufficiently prompt in furnishing new observations; Flamsteed deeming his materials of the utmost importance, and that he "had done more for the restitution of astronomy than had been done in some ages before;" till at length Newton "saw so little prospect of obtaining what he wanted," as to make him give up the Lunar theory "as a thing impracticable." In January 1696, Flamsteed offered more observations, but Newton, preparing for his new duties at the Mint, does not appear to have answered the letter.

In 1698, Newton having resumed his investigations into the Lunar irregularities, again visited Flamsteed at Greenwich, who supplied him with corrections of former computations, but complains of Newton's reserve. Soon afterwards Dr. Wallis applied for Flamsteed's observations on the parallax of the earth's annual orbit, which he furnished, and at the same time mentioned that he had supplied Newton with materials "for the improvement of the Horroxian theory of the moon." This offended Newton, who said, in a letter to Flamsteed, "I do not love to be printed on every occasion, much less to be dunned and teased by foreigners about mathematical things; or to be thought by our own people to be trifling away my time about them when I should be about the king's business." Before this time he had furnished Newton with all the lunar observations which he had made.

When Flamsteed had completed his catalogue (having already expended 2000*l.* more than his salary), he began to think of printing his results. But Prince George of Denmark, having heard of the extent of Flamsteed's labours, offered in 1704 to bear the expense of printing. A committee, consisting of Newton, Sir Christopher Wren, Dr. Arbuthnot, Dr. Gregory, and Mr. Robartes, 'was appointed to examine Flamsteed's papers, and reported in favour of printing all of them. The superintendence of the printing, the choice of workmen, &c. was in the hands of the committee, and not in those of Flamsteed. The latter gives the details of various vexations to which he was subjected, and which ended (for the time) in a demand that Flamsteed should give up a manuscript copy of the catalogue of stars, which was the result of the observations, and was intended to be published at the end. This was done, with remonstrance, by Flamsteed; but the

catalogue (as much of it as was ready) was sealed up; and Flamsteed declares that he understood it was to be kept sealed up until the whole of the rest was finished. It was three years before the first volume was printed; and during this time many small circumstances occurred which, if Flamsteed's colouring of the more important facts be correct, show a most determined intention on the part of the committee to give annoyance. Prince George died in 1708, before the second volume was begun; and the office of the committee was gone; but they still retained the papers in their keeping. Flamsteed, thinking nothing further about immediate publication, applied himself again to his observations. In March 1710-11, he was surprised by being told that the seal of his catalogue had been broken, and that it was going through the press. Flamsteed immediately obtained an interview with Dr. Arbuthnot, who assured him that none of it was printed. This was not the fact; for in a few days Flamsteed himself received several printed sheets, and learned that Halley had publicly exhibited others in a coffee-house, and boasted of the pains he had taken in correcting their errors. The result was, that in 1712 appeared the book known by the name of Halley, and entitled '*Historiæ Cœlestis libri duo*,' &c. Flamsteed, exceedingly irritated by the conduct of Newton and Halley, and being not naturally of a gentle temper, now kept no terms whatsoever with either. Newton had recommended the appointment of a board of visitors for the Observatory (made up of members of the Royal Society), and Flamsteed was summoned to the Royal Society, October 26, 1711, to know if his instruments (his own property) were in order, &c. Here a warm quarrel arose. Flamsteed declared to Newton that he had been robbed of his labours, and Newton called Flamsteed various names, of which 'puppy' was the least. Newton reminded Flamsteed that he had received 100*l.* a year for thirty-six years, and Flamsteed asked Newton what he had done for 500*l.* a year which he had received since he came to London. Flamsteed charged Newton with having broken the seal of his catalogue, and Newton replied that he had the queen's order. After this interview, Flamsteed resolved to print all his observations, &c., at his own expense, and applied to Newton for the manuscript of 175 sheets of observations which were in his hands. The demand was refused, and Flamsteed commenced legal proceedings for their recovery. The result of the suit is not known; but Flamsteed states that Newton at last delivered all the contested manuscript to Halley. The additional expense caused to Flamsteed by this act of Newton was about 200*l.*

Queen Anne died in 1714, and the earl of Halifax, Newton's great supporter at court, in 1715. Flamsteed was now stronger with the government than his opponents; and the lords of the treasury, at his request, surrendered all that remained of Halley's edition (about 300 copies out of 400) to his mercy. These he immediately committed (in part) to the flames—a sacrifice, as he calls it, to heavenly truth—reserving only about ninety-seven sheets of each, which had been printed as he wished, and which afterwards formed part of his first volume. From this time to his death, which took place at the end of December 1719, he was occupied in printing his '*Historia Cœlestis*,' which however he did not live to finish. It was completed by his widow, with the aid of Mr. Crosthwait, his assistant, and his friend the celebrated Abraham Sharp, and was published in 1725. The maps, known by the name of Flamsteed's Atlas, were superintended by the same persons. The '*Historia Cœlestis Britannica*' contains a complete account of the instruments and the methods employed, together with a large mass of sidereal, lunar, and planetary observations, and the result of the former, namely, the British Catalogue. This work seems to us to occupy the same place in practical astronomy which the Principia of Newton holds in the theoretical part.

This very singular story is, as we have already stated, an *ex parte* one, resting entirely on Flamsteed's authority, supported by such documents as he considered necessary to adduce. Some further evidence however has been brought forward by Sir D. Brewster, which throws considerable light upon the whole transaction, goes some way to exonerate Newton from the heavier part of the charge, and shows Flamsteed to have been a not very scrupulous adversary.

It will have been observed above, that Flamsteed is represented, in March 1710-11, as having been surprised at learning "that the seal of his catalogue had been broken, and that it was going through the press." Whereas, in a letter to Sharp (May 15, 1711), he writes that he and Newton had met on March 20, 1707-8, when the second agreement respecting the printing was signed, "and then Sir Isaac had opened the catalogue and desired me to insert the magnitude of the stars in their places, for they had not always been inserted in it." Again, Flamsteed, in his autobiography, has given the articles of agreement for the printing of his papers which he proposed, and not those which he signed. After signing the agreement, he began complaining of the hardness of the bargain; he also states it was above two months, and in another, that "it was some months after (March 20, 1708) ere I could get the 125*l.*, and I am apt to think, had it not been for Dr. Arbuthnot, I should never have received it." By the agreement of March 20, the money was to be paid on the re-delivery of the catalogue of stars to Sir Isaac, which was done on that day, and the order of the referees exists, directing the payment, dated March 26, and an order of Flamsteed himself, dated April 10, to pay

the money to a Mr. Hodgson, which was done on April 12. The agreement which was actually signed by the parties has not been discovered, but there are three drafts of it by Newton, differing materially from that propounded by Flaxman. Halley states that it was agreed that the catalogue of stars should accompany the first volume, which Mr. Baily denies. But Flaxman himself says, "I signed the articles, but covenanted that the catalogue of the fixed stars mentioned to make a part of the first volume, should not be printed but with the last." In opposition to this, which however admits that the agreement which he signed provided for the printing of the catalogue in the first volume, there is in Newton's draft a statement of the contents of the two volumes, in which the catalogue of stars stands as the very first item of the first volume. It is also to be observed, that Flaxman made no objection for a considerable time. On the signing of the second agreement, by which he was to receive a payment of 125*l.*, he writes to Mr. Sharp, on April 19, 1798, of this "change in his affairs which it will not be displeasing to him to hear." The payment no doubt was very small for the immense amount of labour, performed also with instruments of his own, and Flaxman had very sufficient reasons for being discontented, but he seems to have vented his displeasure to a considerable degree on the wrong parties; on the other hand, he was much harassed by the printing committee in urging haste with his calculations, which seems to have been done with as little consideration as if he had been a railway contractor employed on an operation requiring nothing but bodily labour.

We have thus endeavoured to present a view of both sides of the question, so that our readers may form their own conclusions. We may add, that among the matters contained in Mr. Baily's preface is a complete refutation of a story derived from a provincial history, that Flaxman, when very young, was convicted of highway robbery, and that a pardon was found among his papers. On searching the records, no such pardon is found entered, and various other circumstances make it physically impossible that Flaxman could have been thus engaged at the time stated.

FLAXMAN, JOHN, was born at York, July 6, 1755; yet he may properly be considered a denizen of the metropolis, for he was brought to London when not more than six months old. At that time his father, who was a moulder of figures, kept a shop in New-street, Covent Garden, and subsequently in the Strand; and it was in this humble studio that the future artist received the first artistic impressions. A natural weakness of constitution and delicacy of health, which continued until about his tenth year, gave him a relish for solitary and sedentary amusement. It was perhaps fortunate for him as an artist to have thus early and constantly before his eyes objects adapted to fix his feelings, and to rouse his intelligence. Seated behind the counter with paper and pencil, or with books, he studied more desultorily than would otherwise have been the case, yet perhaps more profitably and more diligently, because less compulsorily.

After the death of his mother, which occurred when he was in his tenth year, his father married a second wife, who treated young Flaxman and his brother with such tenderness as to win their affection and esteem. It was somewhere about this period that having attracted the notice of the Rev. Mr. Mathew, he was introduced by that gentleman to his wife, a lady of very superior acquirements, who took delight in making him acquainted with the beauties of Homer and Virgil, while he would attempt to embody with his pencil such poetic images or parts of the narrations as most caught his fancy. By those kind and judicious friends he was encouraged to study the original languages; and although here also he was chiefly his own tutor, he made such proficiency as enabled him to read the master poets of antiquity, if not very critically, yet with sufficient readiness to enter into their spirit and follow their conceptions.

In his fifteenth year Flaxman became a student of the Royal Academy, and in 1770 exhibited, as his first subject there, a figure of Neptune in wax. Here, while he distinguished himself by the assiduity with which he prosecuted his studies, he received a lesson which taught him that application and enthusiasm combined are not always a match for mediocrity when backed by favour, or following the ordinary routine of the established authorities; for on his becoming a candidate for the gold medal (the silver one he had previously carried off), the prize was awarded to Engleheart, a now utterly forgotten name. Mortified, yet not dispirited, Flaxman returned to his studies, with unabated energy, although for some time compelled to devote a considerable portion of his time to providing for the exigencies of the passing day, which he did by designing and modelling for others, particularly for the Wedgwoods, to whom his talents and his taste were eminently useful. Moderate as was the remuneration, such employment put him at ease in his pecuniary circumstances, because he already possessed one very important fund towards pecuniary independence, namely a contented frugality and an utter disrelish of all expensive habits and amusements. And here it may be observed, that even in after-life, when he was in comparative affluence, and when his fame would have been a passport to the most brilliant circles, he continued to distinguish himself by perfect simplicity in his habits and mode of living, equally remote from affectation on the one hand and a spirit of penuriousness on the other.

In 1782 he removed from his paternal residence in the Strand, and established himself in a house in Wardour-street. In the same year he married Miss Ann Denman, a woman equally estimable for her virtues and her accomplishments. He soon after gave proofs of increased ability in his profession by his monument of Collins the poet, in Chichester Cathedral, and that of Mrs. Morley, in Gloucester Cathedral; the latter especially a work replete with that poetic simplicity and pathos which hallow so many of our artist's productions of that class. In 1787 he set out for Italy, accompanied by his wife. While he was at Rome he made a series of thirty-nine subjects from the 'Iliad,' and thirty-four from the 'Odyssey,' illustrative of the principal events in those poems. Although he received a very small pecuniary remuneration for these remarkable compositions, he was paid in worthier coin, for they at once stamped his reputation. They also served to collect patrons around him; among the rest the Countess Spencer, for whom he composed his series of illustrations of 'Æschylus,' and the eccentric Earl of Bristol and Bishop of Derry, who had commissioned him to execute the group of 'Athamas.' This group Flaxman engaged to execute for 600*l.*, a sum far too small to repay the costliness of the material and the labour bestowed on its execution; but Flaxman was too honourable to retract from his engagement. During his stay at Rome he executed for Mr. Thomas Hope an exquisite small marble group of 'Cephalus and Aurora.' It was for him too that he produced that third sublime series of poetic compositions, the 'Illustrations of Dante,' amounting altogether to 109 subjects, namely, thirty-eight from the 'Inferno,' as many from the 'Purgatorio,' and thirty-three from the 'Paradiso.' Here, being left almost entirely to the resources of his own imagination, without assistance from the previous ideas of other artists, he manifested still greater originality of mind and intellectual vigour than in the Homeric series, or that from Æschylus. All the three constitute an almost new province of art, combining the distinguishing qualities of picturesque and sculpturesque design.

On his return from Italy, where he had spent upwards of seven years, not unprofitably as regarded his pecuniary affairs, and certainly most profitably as regarded both his studies and his reputation, he took a house in Buckingham-street, Fitzroy-square, and in a very short time distinguished himself by his noble monument to Lord Mansfield. He was unanimously elected an Associate of the Royal Academy in 1797. In that year he exhibited at the Academy his monument of Sir W. Jones, now in the chapel of University College, Oxford, and three bas-relief sketches of subjects from the New Testament, namely, 'Christ raising from the Dead the Daughter of Jairus,' and two illustrative of the texts, 'Comfort and Help the Weak-Hearted;' 'Feed the Hungry.' These may be considered as the commencement of a cycle of scriptural compositions intended to show that the simple truths of the Gospel were fully capable of inspiring the sculptor and supplying him with appropriate subjects. Of this class are the reliefs of the monument of Sir F. Baring's family in Micheldean Church, Hants, which expressly figure the ideas of the following sentences: 'Thy will be done'—'Thy kingdom come'—'Deliver us from evil.' To these may be added his beautiful illustration of the text, 'Blessed are they that mourn,' in a monument to Mary Lushington, of Lewisham, Kent, representing a mother sorrowing for her daughter, and comforted by an angel. His groups of 'Come, ye Blessed'—'Lead us not into temptation'—'Charity,' and the monuments of Countess Spencer and Mrs. Tighe, the poetess, not to enumerate others, are also replete with religious sentiment and fervour. That he should have been pre-eminently happy in such subjects needs not greatly excite our surprise, because he was at home in them; in them his head and hand spontaneously obeyed the dictates of a heart tenderly alive to every sentiment of devotion. Hence it was that he so successfully broke through the conventional trammels of his profession, and opened an almost entirely fresh track for himself. On the contrary, when fettered down to common-place ideas and subjects, he did not rise at all higher than many others have done. Even his monument of Nelson, as well as others by him in St. Paul's, are cold both in conception and execution. Whether he would have succeeded very much better in the colossal figure of Britannia, which he proposed should be erected upon Greenwich Hill, perhaps admits of doubt; although that he could have executed such a work can hardly be questioned. A figure however of such stupendous dimensions, for its height was to have been not less than 200 feet, was treated as an absurdly extravagant, if not impracticable and utterly visionary scheme.

In 1810 he was appointed to the then new professorship of sculpture at the Royal Academy, to which circumstances the world is indebted for his series of Lectures on the art, which, although of no extraordinary merit as literary compositions, are full of good sense and good feeling, and may be studied with profit, not by those alone of his own profession, but by artists and men of taste generally.

Till the year 1820 he had enjoyed a life of serenity and tranquil competence, with constant occupation in the art he loved, and increasing fame attending it; but he had now felt the bitterness of losing his wife. He henceforth felt a blank in his existence which neither the solace of friendship nor the honours of public applause could fill up. Nevertheless he continued to apply himself vigorously to his art, and some of his latest productions are among his best. The

'Shield of Achilles,' first modelled in 1818, afterwards cast in silver-gilt for George IV., is certainly one of the most splendid achievements of the art in modern times. To this period belong also his 'Psyche,' and group of the 'Archangel Michael and Satan' (at Petworth), both of them stamped with his genius. The interruptions he experienced from illness or infirmity were but few and brief; and until three days before his death he was able to employ himself in his usual pursuits and studies without particular inconvenience. He died on the 7th of December 1826, and on the 15th he was followed to the grave (in the churchyard of St. Giles-in-the-Fields) by the president and council of the Royal Academy.

It is difficult to do justice to the character of Flaxman as a man or as an artist without the semblance of overstrained panegyric. In some of the mechanical parts of his art he did not greatly excel, neither do his works display that high finishing and delicacy of execution which captivate the eye and often mislead the judgment. "If Flaxman," says Cicognara, "had possessed skill in modelling and execution equal to his talent in invention and composition, he would certainly have had a great share in the prosperous revolution which has taken place in the art. Nevertheless it is greatly indebted to him, since, as far as we are acquainted with his productions, we may affirm that they have mainly contributed to awaken sculpture from a certain monotonous lethargy, and to restore the golden style—the severity of the antique—which he knew how to apply to his own designs." This praise, if not very warm, is sufficiently discriminating and just upon the whole. Flaxman helped to restore the art from the inanity and soulless, though occasionally graceful, mannerism into which it had fallen, and in which it appeared inclined to remain. He rendered it more poetic, taught it to address itself to the heart, to touch the noblest feelings of our nature, and, while it impressed, to elevate them.

Flaxman, though he lived frugally, was barely able to secure a decent competence during the larger part of his life, and it was probably only by means of the highly-paid commissions he received from government during his later years, that he was enabled to save something beyond what sufficed to provide for his moderate daily wants. At his death his property was sworn at under 4000*l.*, while his far inferior contemporary Nollekens, the portrait sculptor, died worth nearly 150,000*l.* He left his property chiefly and all the contents of his studio to his wife's younger sister, Miss Maria Denman, whom he had long adopted as a daughter. The contents of his studio included nearly all his working models, casts of all his chief works, &c.; Miss Denman preserved the collection entire with affectionate reverence for five-and-twenty years after the death of the great sculptor; regarding herself as she declared but as a trustee for the public until a fitting depository for these most valuable works should be found. At length a not unsuitable museum was found—though unfortunately not a national one: the Council of University College having consented to have the cupola of the college adapted to their reception. It was accordingly altered by Mr. Donaldson and converted into a very good sculpture gallery, and there, in what is now called Flaxman Hall, the working models and casts of about one hundred and forty of the chief works of our greatest English sculptor are arranged.

FLECHIER, ESPRIT, born in 1632 at Pernes, near Carpentras, studied in the college of the 'Fathers of the Christian Doctrine,' of which congregation his maternal uncle was then the superior. Being ordained, he went to Paris, and became preceptor to a young gentleman. He made himself favourably known by writing penegetic orations in honour of saints and also of deceased distinguished contemporaries, which were much liked at the time as specimens of eloquence. In 1673 the Abbé Flechier was named a member of the French Academy; and in 1682 he was appointed by Louis XIV. almoner to the Dauphiness. In 1685 he was sent at the head of a mission to reclaim to Catholicism the Protestants of Poitou and Brittany. On his return to Paris he was appointed by the king bishop of Lavaur, but was soon after transferred to the see of Nîmes. The revocation of the edict of Nantes, 22nd October 1685, had been followed by a species of persecution against the Protestants, or Huguenots as they were called, who were very numerous at Nîmes and in the neighbouring districts. Flechier, who was naturally of a mild disposition, while obeying the intolerant orders of the king towards this part of the population, executed them with as much temperance as could be expected from one in his situation. His letters contain painful evidence of the oppressions and cruelties committed at that epoch. When the persecuted Protestants rose in 1702-3 against their oppressors, they fearfully retaliated by killing the Catholics and burning their churches. This was followed by Louis XIV. sending a large force under a marshal of France, and the devastation of the mountainous districts of the Cévennes ensued. Flechier repeatedly expressed his astonishment at the boldness and courage of the victims. (Lettre 138, in the last volume of 'Les Œuvres de Flechier.') Flechier died at Nîmes in February, 1710. His scattered works have been collected and published:—*Œuvres complètes de Flechier*, 10 vols., Nîmes, 1782. They consist of biographies, sermons, panegyrics, and 'oraisons funèbres,' in which last he was considered to rival and almost to excel Bossuet. Cardinal Maury ('*Essai sur l'Eloquence de la Chaire*,' vol. I.) examines with a critical eye

Flechier's oration in honour of Marshal Turenne, which was considered as his masterpiece, and points out its defects. Flechier wrote a life of Cardinal Ximenes, rather too partial according to some critics, and a life of Theodosius the Great. His correspondence above mentioned furnishes some interesting materials for contemporary history.

FLECKNOE, RICHARD, is said to have been an Irish Roman Catholic priest. He was a minor poet and wit in the time of Dryden, and would have been long since forgotten had not that writer used his name as the title of a severe satire against Shadwell, and therein proclaims that he

"In prose and verse was own'd without dispute,
Through all the realms of nonsense absolute."

Of course his name was transmitted to posterity with the same ignominy that has accompanied the heroes of Pope's 'Dunciad.' The reader of satires should not however take too much for granted, nor be too ready to admit as a fact that all objects of ridicule and invective are such fools and knaves as they are represented. Party feeling and private animosity may have occasioned the attacks directed by a powerful opponent, rather than a cool judgment and a rational inquiry into merits. In the case of the satires of Pope and Dryden, the satires themselves are in the hands of every gentleman possessing a moderate library, while the works of the persons satirised are utterly unknown, excepting to those who take an active interest in studying the literature of the period. Hence a vast number of persons are by name familiar to the mass of readers, on account of their having been by our great satirists denounced as the writers of unredeemed trash, without any opportunity being given of examining the justice of the sentence. Flecknoe, in particular, is a victim to these partial views. There is no doubt that the mere readers of Dryden take it for granted that Flecknoe was an almost unqualified idiot, yet it is a fact that though he did not possess what can be called genius, and was sadly defective in his versification, he still possessed much fancy, and wrote some small pieces which for happy turns of thought would not mar an eminent name. Flecknoe wrote some plays of no value: his 'Damoisells,' a comedy, was printed in 1687, but not played. 'Love's Dominion' (1654), 'The Marriage of Oceanus and Britannia,' and 'Ermina, or the Chaste Lady,' are the titles of some of his other dramatic pieces. The date of Flecknoe's birth is nowhere stated; he is believed to have died somewhere about 1678.

FLEETWOOD, CHARLES, was descended from a private family in Lancashire, from which several distinguished persons had sprung. From a trooper in the earl of Essex's forces he rose to be colonel of infantry, and was made governor of Bristol. In October 1645, he was returned to Parliament for Buckinghamshire, and in 1647 was one of the commissioners named to treat with the king. At the battle of Worcester, Fleetwood distinguished himself so much that he gained great favour both with Oliver Cromwell and the army in general: indeed afterwards, when the king was executed, and the parliamentary army became more powerful, he was inferior to few in the influence that he possessed among the soldiery. Fleetwood had married Frances, the daughter of Thomas Smith of Winston, Norfolk, by whom he had three children, but this lady being dead, he was fixed upon by Cromwell, from political motives, to marry Bridget, his eldest daughter, the widow of Ireton. Soon after he became his son-in-law the Protector nominated him commander-in-chief of the forces in Ireland, where he was also invested with a commissionership for the civil department. Cromwell however feeling that his interests were not perfectly secure in the hands of Fleetwood, who was a thorough republican, and strenuously opposed to the Protector being made king, sent his son Henry Cromwell to watch over his conduct. Some enmity was thus produced, and with the view of putting an end to it, Cromwell created Fleetwood one of the new lords, and made him the chief of the fourteen major-generals to whom the government of the nation was arbitrarily committed and who were deputed to search for such royalists as had borne arms under Charles I., or were disaffected to the present government, with power to imprison them, and to decimate their estates. When Richard Cromwell became Protector, Fleetwood strove to obtain his title, and to supplant him in his authority; but while he was caballing against him, the nation, wearied with tumult and discord, recalled the exiled king.

At the immediate time of the Restoration it was supposed that Fleetwood would be executed as a rebel: his life was with difficulty saved, and he retired to Stoke Newington, where he was allowed to spend the remainder of his life in obscurity. He died in 1692. In character he was cunning, but irresolute, and of shallow capacity; his influence in Cromwell's army is perhaps mainly attributable to the excess of his fanaticism.

FLETCHER, ANDREW, was the son of Sir Robert Fletcher, of Saltoun, in East Lothian, where he was born in 1653. Sir Robert is said to have died when his son was a child. Andrew Fletcher's early education was superintended by Gilbert Burnet, afterwards the celebrated bishop of Salisbury, who was at this time parish minister of Saltoun. To him Fletcher was probably indebted for his first bias in favour of those political principles to which he adhered through his life. When he grew up he spent some time in travelling on the continent. On his return home he obtained a seat in the Scottish

parliament as commissioner, or member, for his native county; and in that capacity he soon became distinguished as one of the foremost opponents of the government. After some time however he deemed it prudent to withdraw to Holland; on which he was summoned before the lords of the council, and when he did not make his appearance was outlawed, and his estates confiscated. He ventured to come home in 1633, but soon returned to the continent, and there remained till 1635, when he engaged in the attempt of the duke of Monmouth. But he had scarcely landed in England when he shot the mayor of Lyme dead in a private quarrel, and found himself obliged precipitately to leave the country. He then proceeded to Spain, and afterwards to Hungary, where he took part in some military operations against the Turks, and distinguished himself by his gallantry. When the scheme of the English Revolution began to be projected, he repaired to Holland to join the councils of his countrymen there; and he came over to England with the Prince of Orange and his old friend Burnet in 1688. He now recovered possession of his estate, and again sat as representative for his native county, first in the Scottish Convention, and afterwards in parliament. After a short time however he became nearly as determined an opponent of the government of King William as he had formerly been of that of Charles II. His last exertions as a public man were directed against the scheme of the union of the two kingdoms. He died in London in 1716. He is the author of the following tracts, all of which, we believe, were originally published without his name:—1, 'A Discourse of Government with relation to Militia,' Edinburgh, 1698; 2, 'Two Discourses concerning the Affairs of Scotland, written in the year 1698,' Edinburgh, 1698; 3, 'Discorso delle Cose di Spagna, scritto nel mese di Luglio, 1698,' Napoli, 1698; 4, 'Speeches by a Member of the Parliament which began at Edinburgh the 6th of May, 1703,' Edinburgh, 1703; 5, 'An Account of a Conversation concerning the right Regulation of Governments for the Common Good of Mankind; in a Letter to the Marquis of Montrose, the Earls of Rothes, Roxburgh, and Haddington, from London, the 1st of December, 1703,' Edinburgh, 1704. The original editions of these publications are scarce, but they were all reprinted at London in an octavo volume in 1787, under the title of 'The Political Works of Andrew Fletcher, Esquire.'

Fletcher writes in a flowing and scholarlike style, occasionally rising to considerable warmth and energy; his compositions are interspersed with many sagacious and happily expressed remarks, and they have at all times the charm of earnestness and perfect conviction. But for deep or extensive views in the philosophy of politics they will be searched in vain. He is a stern democrat, and violent in his denunciations of the arbitrariness and oppression of kings, yet he professes to provide for the poor by the restoration of some such system of slavery as he conceives existed among the Greeks and Romans. This singular proposal is contained in his *Two Discourses* on the affairs of Scotland. Among the most curious of his works is his 'Conversation on Governments,' which appears to be a report of a real conversation, the parties being Fletcher himself, the Earl of Cromarty, Sir Edward Seymour, and Sir Charles Mungrove. The part of the dialogue given to Seymour in particular, is highly characteristic. It is in this production that we find the remark so often quoted about the superior influence and importance of the national ballad-maker to the national law-giver: Fletcher gives it as the observation of a friend.

FLETCHER, GILES and PHINEAS, were the sons of Dr. Giles Fletcher, who was employed by Queen Elizabeth as ambassador in Russia, and cousins of John Fletcher the dramatist.

GILES FLETCHER, the elder, was born about 1580, was educated at Trinity College, Cambridge, and died at his living of Alderton, in Suffolk, in 1623. The single poem which he has left, 'Christ's Victory in Heaven, Christ's Triumph on Earth, Christ's Triumph over Death, Christ's Triumph after Death,' will, as Southey observes, "preserve his name while there is any praise." Its beauty is of a very peculiar cast, uniting many of Spenser's characteristics with a greater regard to antithesis.

The 'Wooling Song,' in the second part of the poem, is as perfect a specimen of fanciful elegance as can be found; and is the more striking from being written in octo-syllabic couplets, while the rest of the poem is in a variation of the Spenserian stanza.

PHINEAS FLETCHER, younger brother of Giles, was born about 1584, and admitted scholar of King's College, Cambridge, in 1600. In 1621 he was presented to the living of Hilgay, in Norfolk, where he died about 1660.

He wrote, in addition to his great work, some Eclogues; a 'History of the Founders and Benefactors of Cambridge University,' in Latin hexameters, and a drama called 'Sicelides.' But the only work for which he is now known is 'The Purple Island, or the Isle of Man,' a description of the human soul and body, but especially the latter—respecting which there is the most extraordinary fulness of what may be called anatomical details—much in the style of 'Christ's Triumph.'

The two Fletchers, with Browne, make up a kind of Spenserian school, possessing considerable common resemblances, with original qualities enough to procure for each a very high reputation. They are the more remarkable as having tended to form the style of Milton's poetry, as may be seen by any one well acquainted with both.

FLETCHER, JOHN, was born in 1576, and was the son of the Rev. Dr. Fletcher, afterwards bishop of Bristol. He was educated at Cambridge with his friend Francis Beaumont, and is said to have distinguished himself as a good scholar. For an account of his principal works and his literary connection with Beaumont, see *BEAUMONT*, FRANCIS. Fletcher survived his friend nearly ten years; he was carried off by a plague which happened in 1625. Between the death of Beaumont and that of Fletcher, eleven of the plays found in their 'Works' were produced, and must be assigned wholly to Fletcher; and it appears most probable that the pastoral drama of the Faithful Shepherdess is also to be attributed to him alone: but there is nothing in the plays which belong wholly to Fletcher, to distinguish them from such as are the joint production of the two friends. All that has been said in the article above referred to of the dramas of Beaumont and Fletcher, applies equally to those written by Fletcher only. In both, an ever-present licentiousness of thought as well as expression is the pervading characteristic, but in both there lies beneath this the same rich vein of pure poetry; and while we repeat what we said under Beaumont, as to their works being such as to render them, for all but literary students, less adapted for reading in their entire state than in a selection of passages, where might be found "as refined sentiment, lofty and sweet poetry, excellent sense, humour, and pathos, as any in the language, excepting Shakespeare and Chaucer," we take the opportunity of supplying an omission in that article, by adding that such a selection has been made, with a very useful introduction and body of notes, by Mr. Leigh Hunt, and that it forms a volume of Bohn's Standard Library.

FLEURY, ANDRÉ HERCULE DE, CARDINAL, was born in 1653 at Lodève in Languedoc, studied at Paris in the college of the Jesuits, was afterwards made almoner to the queen-consort of Louis XIV., and in 1699 bishop of Fréjus, which see he resigned in 1715, on account of ill-health. Louis XIV. appointed him also preceptor to his grandson, afterwards Louis XV., who became greatly attached to him. After the death of the regent in 1723, Fleury was made a member of the Council of State, and subsequently prime minister, in which office he continued for seventeen years, till the time of his death. The period of his administration was the happiest part of the reign of Louis XV. Fleury was honest, economical, disinterested, a friend to peace, and a patron of learning. He was obliged, against his inclinations, by the court party and Marshal Villars, to take a part in the war of the Polish succession in 1733, in which France engaged chiefly in order to support Stanislaus Leccinsky, father-in-law of Louis XV. Although that object was frustrated by the united forces of Austria and Russia, yet the war terminated in 1738 in a manner advantageous to France, which gained by it the important accession of Lorraine.

In 1741 Cardinal Fleury found himself driven by court influence into another war, that of the Austrian succession, of which he did not live to see the end. He died in 1743, at eighty-nine years of age; and from that time the government of Louis XV. fell deeper and deeper into corruption and decay. Fleury amassed no fortune, but he left the reputation of a wise, benevolent, and faithful minister of state. He completed the building for the royal (now imperial) library, which he enriched with a number of valuable manuscripts, especially in the oriental languages.

FLEURY, CLAUDE, ABBÉ, was born at Paris in 1640, and died in 1723, aged eighty-three years. All the contemporary writers coincide in the opinion that Fleury possessed all the virtues and qualities requisite to constitute a scholar, an honest man, and a Christian. Having completed in a brilliant manner his studies at the college of Clermont at Paris, he embraced in 1658 the profession of his father, who was a distinguished advocate, and he practised at the bar for nine years. To his legal occupations he united the study of literature and history, but the religious turn of his mind having induced him to enter the church, he thenceforward entirely devoted himself to the study of divinity, the Holy Scriptures, canon law, and the Fathers. In 1674 he was appointed tutor to the princes Conti, whom Louis XIV. educated with his son the Dauphin. After that the king intrusted him with the education of his natural son the Prince of Vermandois. Upon the death of the young prince, Louis conferred on Fleury the abbey of Loc-Dieu, in the diocese of Rhodéz, and five years later (1689) he was created sub-preceptor of the king's grandsons the Dukes of Bourgogne, Anjou (afterwards Philip V., king of Spain), and Berri. Fleury thus became the associate of Fenelon. In 1696 he succeeded Labruyère as member of the French Academy, and when the education of the three above-mentioned princes was completed (1707), the king bestowed on him the priory of Argenteuil, in the diocese of Paris. This grant was very acceptable to Fleury, as it afforded him a comfortable retirement for the prosecution of his studies, without depriving him of those resources which are found only in a capital. Being however a strict observer of the canon law, which was the particular subject of his study, and which prohibits a plurality of ecclesiastical benefices, he resigned the abbey of Loc-Dieu. In his retirement at Argenteuil, notwithstanding he was now sixty-six years old, he conceived the plan of his grand work the 'Ecclesiastical History,' and began the execution of it. After the death of Louis XIV. (1716), the Regent Duc d'Orleans nominated Fleury confessor to the young king Louis XV., a post which he held

till 1722, when he resigned it on account of his great age, being then in his eighty-third year. He died a few months afterwards.

Fleury commenced his literary career with the '*Histoire du Droit François*,' 1674. He afterwards published successively '*Institution au Droit Ecclésiastique*,' '*Catéchisme Historique*,' translated into Latin by the author himself, a work which has become classical, and is constantly reprinted; '*Les Mœurs des Israélites*,' of which an English translation was made by Dr. Adam Clarke. '*Les Mœurs des Chrétiens*,' also translated into English. These two last works are considered, for elegance and precision of style, as among the best in the French language. He also wrote '*Traité du Choix et de la Méthode des Etudes*.' But the most valuable of Fleury's works, and that which has established his reputation as a first-rate writer, is the '*Histoire Ecclésiastique*.' It comprehends a space of fourteen centuries, beginning with the establishment of Christianity, and terminating at the opening of the council of Constance. It was objected to the author that he related too many miracles, but he excused himself on the ground that such was the belief of the church to which he belonged. Fleury was engaged on the 20th volume of his *History* at the time of his death. It was continued till the year 1698 by Fobrer, of the Oratoire, in 16 vols. in 4to. Fleury's '*Ecclesiastical History*' is translated into English. The university library of Cambray contains a manuscript of a '*History of France*,' which Fleury drew up for the use of the French princes while he was engaged with their education, but it has never been printed. We must not omit to mention, that, notwithstanding his grave occupations, Fleury had leisure to compose a treatise on the duties of masters and servants. This little work, which has been much esteemed, is translated into English.

FLINDERS, MATTHEW, was born at Donington, in Lincolnshire, about 1760. He went early to sea in the merchant service. In 1795 he was a midshipman in the Royal Navy, and went to New Holland with the ship that conveyed Captain Hunter, the new governor, to Botany Bay. On board this ship he found a congenial mind in George Bass, the surgeon, who, like himself, was bold and adventurous, and had a passionate desire to explore new countries. Soon after their arrival at Port Jackson these enterprising young men launched a little boat, which was appropriately called Tom Thumb, being only eight feet long. In this boat Flinders and Bass, with no other companion than a boy, ran across Botany Bay, and explored George's River 20 miles beyond the point where Governor Hunter's survey had stopped. They made several discoveries and encountered many dangers. Their heroism was appreciated by but few persons in the colony. The English had been ten years in possession, and there was an imaginary line of more than 250 leagues (beginning in the vicinity of the colony) set down on the charts as "unknown coast." Flinders was anxious to remove this blot. The complete examination of Australia became what he called his "darling object." It was not yet known that Van Diemen's Land was a separate island; the existence of a strait dividing it from Australia was first mentioned as a probable fact by Bass, who ran down the coast in a whale-boat, and who suggested that the heavy swell which rolled in from the westward could be produced only from the Great Southern Ocean. Flinders was sent with his old companion Bass to ascertain this fact. They embarked in the *Norfolk*, a large decked boat built of the excellent fir of Norfolk Island; and they had only six men to assist them. They went through the straits, made a rapid survey, and returned to Port Jackson in little more than three months. The name of Bass was given to this strait. In the following year, 1799, Flinders, now a lieutenant in the Royal Navy, was sent in the same small vessel to explore the coast to the north of Port Jackson, where nothing had been done since the imperfect notices by Cook. He visited and examined all the creeks and bays as far north as 25°, paying particular attention to Harvey's Bay, and returned to Port Jackson with satisfactory accounts. On his return to England he was promoted. Bass, we may add, appears to have met with no reward whatever. In 1802 he left Port Jackson as mate or master of a trading vessel, and was never more heard of. In 1820 there was a vague report that Bass was alive and settled somewhere in Peru; but the more probable story is that he was lost at sea.

In July 1801 Captain Flinders sailed from England in the Investigator, a barque of 334 tons, carrying 88 men, including an astronomer, a naturalist, two painters, a botanic gardener, and a miner. England and France were at war at the time, the preliminaries of the treaty of Amiens not being signed until the 25th of October following; but a French pass, conceived in flattering terms, and speaking of the sacred rights of science, was granted to Flinders, who, whether in war or peace, was to be respected by all armed ships of France, and to be entertained as a friend in any French colony that he might make. Such conditions, though not expressly laid down, had been acted upon by the French in the time of Louis XVI.; and about a year before Captain Flinders's departure the English government had regularly established a precedent. M. Otto, in the name of Bonaparte, applied for a similar free pass in favour of Captain Baudin, who, it was said, was going with two ships on a voyage of discovery "round the world;" and the Addington administration readily and courteously granted it, notwithstanding the fierce hostilities which were then raging between the two nations.

In the month of December Captain Flinders made Cape Leuven, on

the south-east coast of Australia; and commencing operations, he gradually surveyed and examined the coast to the eastern extremity of Bass's Straits, where, in Encounter Bay, he met the French ships, which, instead of going round the world, had made straight for Australia, and devoted their whole care to the examination of Van Diemen's Land and New South Wales, evidently with a view to the formation of a French colony. Capt. Baudin had had the start of Flinders by nine months; but he had been delayed in collecting shells and catching butterflies, and at the moment of their meeting he had done little in the way of discovery or survey; and Flinders says that by assiduity and favourable circumstances he had anticipated him in the most interesting parts of the southern coast. He says that he gave Baudin an account of his discoveries. Baudin afterwards said that he found Captain Flinders not very communicative, but that he obtained intelligence of all that had been done on the southern coast from some of his people. From Bass's Straits Flinders sailed to Port Jackson, where he arrived on the 9th of May 1802. Having refitted, he set off again on the 22nd of July. He then steered northerly along the east coast, exploring Northumberland and Cumberland Islands, and surveying the great Barrier Reef of coral rocks—a long and dangerous tract, most necessary to lay down. In fourteen days he conducted the Investigator through these perilous mazes, where he had nothing to guide him but his own vigilance and skill; then bearing still north, he made Torres Straits, and surveyed the vast gulf of Carpentaria, which had been very imperfectly examined by General Carpenter, its first discoverer. While engaged in this duty the Investigator was reported to be "quite rotten," and in such a state that she could not possibly last above six months in fine weather. Three of these months Flinders kept her in the gulf; he then stood away for the island of Timor, where he refreshed his sick and over-fatigued crew. From Timor he made his way with the leaky bark to Cape Leuven. Sailing again along the southern coast, he anchored in the Archipelago of the Recherche; then passing Bass's Straits a second time, he made for Port Jackson, where he arrived on the 9th of June 1803, having lost many of his best men, and among others Good, the botanical gardener. The Investigator was immediately condemned; she was in such a leaky state that people could scarcely conceive how she had been kept afloat.

Unable to continue the survey (there being no disposable vessel in the colony), Captain Flinders embarked as passenger in the *Porpoise*, a store-ship, in order, he says, "to lay his charts and journals before the Lords Commissioners of the Admiralty, and obtain, if such should be their pleasure, another ship to complete the examination of the Terra Australia." The *Porpoise* was accompanied by two trading vessels—the *Bridgewater*, Captain Palmer, and the *Cato* of London. The route chosen was by Torres Straits. On the 17th of August, at night, the *Porpoise* suddenly found herself among breakers, and the very next instant "striking upon a coral-reef, she took a fearful heel over her larboard beam-ends." A minute or two after, the *Cato* struck on the same reef, about two cable-lengths off, and went over. The *Bridgewater*, which was close by, cleared the rocks, and was perfectly safe in smooth water; but Palmer basely "bore away round all," and then pursued his course without doing so much as sending a boat to ascertain the fate of the two crews. As morning dawned, Flinders, who acted with admirable self-possession, contrived to get the men safely landed on a sand-bank, which at all stages of the tide remained a little above water-mark. They removed some portion of the stores from the wrecks, and made themselves as comfortable as men could be in such a situation. There is scarcely a more interesting case of shipwreck upon record; and the methods adopted, and the admirable order preserved, show that there was a master-mind among them. On the 26th of August Flinders left the reef in a small open boat, to make a voyage of 750 miles. He however got safely to Port Jackson on the 6th of September, and procured a small schooner, the *Cumberland*, which was only twenty-nine tons, and when she got to sea it was found that she was very leaky. She was accompanied as far as the wrecks by another schooner, and by a trading-vessel which was bound for China. Flinders reached the reef on the 7th of October, and was received with three cheers. In the meanwhile the poor sailors on Wreck Reef Bank had planted oats, maize, and pumpkins, and the young plants were up and flourishing. Captain Flinders regretted that he had no cocoa-nuts with him to plant on the bank. Some of the men went back to Port Jackson in the schooner, some embarked in the trading-ship bound for China, the rest cheerfully remained with Flinders, to make, in the ill-conditioned *Cumberland*, which was not quite so large as a Gravesend sailing-boat, the circumnavigation of half the globe; for Flinders intended to reach England with this miserable craft. He mentions that not a man refused to share the risk with him except his clerk. Having gone through Torres Straits, and touched again at Timor, Flinders stretched boldly across the Indian Ocean, and made the Isle of France, which was not yet taken by the English. Though the war had been renewed, he relied on his French pass, and indeed he could scarcely choose, for the little *Cumberland* was in a sinking state when he got her into the French port. To his astonishment the authorities of the Isle of France seized the vessel and all his papers, and declared him and his people to be prisoners of war. The governor even chose to consider Flinders as a spy, and treated him with a brutal severity which, united with his uneasiness of mind, certainly

had the effect of shortening his valuable life. Flinders knew that Baudin was returning to France, and he saw with a prophetic eye that the Frenchman would claim the merit of all his discoveries on the southern coast of Australia. He thought the governor De Casn too illiterate to know or care much about the matter, otherwise he says that he should have been induced to suspect that he was detained a prisoner in order that Baudin might have the start of him in publishing, and make the world believe that it was to the French nation alone they were indebted for the complete discovery and examination of those parts. Some English writers did not hesitate to take this view of the case, and what followed in France settled the question. A volume and an atlas were published; the whole of the southern coast, including not only all the discoveries of Flinders and Bass, but also those of Nuyts, Vancouver, Grant, and Dentrecaesteux, was laid down as new land, and called 'Terre Napoléon.' Every point which had been named by Flinders and his precursors was named afresh, and there were all sorts of significant names given, from Cape Marengo and Cape Rivoli to Talleyrand Bay. Baudin had made about fifty leagues of real discovery; he claimed or seemed to claim nearly nine hundred leagues.

After pining six years a prisoner in the Isle of France, Flinders was liberated, and he reached England at the end of the year 1810. His charts and plans were restored to him, but one of his log-books was kept or destroyed. His health was completely broken, but as long as there was work to do he kept up his energy, correcting his maps, and writing out his descriptions. After revising his last sheet for press he drooped; he died in the month of July 1814, on the very day his book was published.

(*A Voyage to Terra Australia, &c., in the years 1801, 1802, and 1803, in H. M. Ship Investigator, and subsequently in the armed vessel Porpoise and Cumberland schooner*, 2 vols., with Atlas, London, 1814; also *Quarterly Review*, vol. xii.)

FLINK, GOVERT, a very able Dutch painter, born at Cleves in 1616. His parents were wealthy, and designed Govert for a merchant, an occupation to which he showed every disinclination; but his parents steadfastly opposed his own inclination to become a painter, until they happened to hear a sermon by Lambert Jakobzen, a Minorite of Leeuwarden, who was himself a painter. They in consequence changed their notions as to the eligibility of Govert's choice, and placed him with Jakobzen to learn to paint. He studied afterwards a year under Rembrandt at Amsterdam, and completely mastered his style of execution and colour, and adhered to it until after the death of Rembrandt, when the Italian taste prevailed, and he had seen the works of Rubens and Vandyck. Flink then took as much pains to get out of Rembrandt's manner as he had before taken to acquire it. He was however as successful in the one as in the other. He died in 1660, aged only forty-four. His last picture is also his best,—"Solomon praying for Wisdom;" it is in the Council Hall at Amsterdam. He has also painted many other admirable historical pictures and portraits: he has, indeed, had few superiors as a portrait-painter. Flink formed a good collection of prints and Italian drawings, which was sold after his death for 12,000 florins.

FLINT, TIMOTHY, an American clergyman and writer, whose career is curiously illustrative of the shifting phases through which professional men occasionally pass in the United States. Born in July 1780 at North Reading in Massachusetts, he became, after passing through the theological course at Harvard University, in 1802 pastor to a congregational church at Lunenburg, Massachusetts. Here he remained for twelve years, but political differences with leading members of his church having rendered his position very uncomfortable, he in 1814 resigned his charge. In the following year he comforted his services to a missionary society, and in September 1815 he set out with his family in a two-horse wagon for the then almost unoccupied western valleys of the Mississippi and Ohio. Having spent the first winter in Cincinnati, he pushed forward, and during seven or eight successive summers preached his way through Ohio, Indiana, Kentucky, Missouri, and Arkansas. His health failing, he resigned his mission, and during the next two or three years tried farming and school-teaching at New Orleans, on the borders of Lake Portchartraine, and at Alexandria on Red River, without much success in either vocation. At length, finding that in the west he had utterly broken down in health and pocket, he turned homeward, and reached Massachusetts in safety, though as he fancied only to die in his native place. His health improved however, but he now found himself at the age of five-and-forty with life to begin anew, and his proper calling closed to him by his confirmed ill-health. He set to work with the undaunted energy so characteristic of his countrymen. He had made ample notes of the countries he passed through in his missionary travels, and he now composed from them 'Recollections of Ten Years' Residence and Travels in the Valley of the Mississippi,' which he published at Boston in 1826. The truth and picturesque force of the descriptions secured for his book a favourable reception in Europe as well as in America: it was reprinted in London, and translated into French. Mr. Flint at once determined to make literature his profession, and somewhat oddly, considering his 'antecedents,' his first venture, after forming this resolution, was as a novelist in 'Francis Berrian, or the Mexican Patriot,' an autobiography. But the news of the European success of his Mississippi 'Recollections' incited him to write a second part to

that work, or rather a more formal work on the same country, then an almost undescribed one. It was published at Cincinnati in 1827 under the title of 'The Geography of the Mississippi Valley,' and with the 'Recollections' formed by far the most valuable account which had up to that time been published of the geography of the western states, and the two works still remain perhaps the best description of the scenery and physical features of the great valley of the Mississippi.

During the next three years Mr. Flint published three more novels, 'Arthur Clenning,' a sort of 'Robinson Crusoe' story—the adventures of the hero occurring however in Australia and Illinois; 'George Mason, or the Backwoodsman;' and the 'Shoshonee Valley,' in which an adventurous Baptist missionary, well skilled in 'trapping,' plays an important part, and in which there can be little doubt the author's own experience furnished much of the materials. His novels hardly meeting with the success he desired, Mr. Flint now resorted to his early scientific pursuits. While a clergyman at Lunenburg, he had been a diligent student in natural history and chemistry; indeed his fondness for the latter had involved him in some trouble. For when he and his flock began to disagree, some of the more ignorant or unscrupulous of the malcontents set afoot a report that his occupation in the 'laboratory' was that of making counterfeit coin; and such was the effect of the report, that Mr. Flint deemed it necessary to prosecute one or more of the parties for slander. Returning to his scientific studies, he now lectured on natural history, geology, chemistry, the steam-engine, the application of science to the arts, &c.; and in 1832 published his lectures at Boston.

He next turned his attention to periodical literature; in the first instance acting, during 1833, as editor of the 'Knickerbocker Magazine.' On that passing into other hands he removed to Cincinnati, where, for three or four years, he edited the 'Western Monthly Magazine;' at the same time writing numerous tales and essays for several other periodicals; a 'Life of Daniel Boone, the Backwoodsman;' a 'History of the Indian Wars of the West;' translations, &c.

At length entirely worn-out, he returned once more to his native town, and there, a few months after his wife, he died August 16th, 1840. Timothy Flint takes no very high rank as a writer—he wrote too much and too fast to write well—but there is much descriptive power and some originality in his works, and his story is one so remarkable, as an example of energy, perseverance, and honest self-helpfulness, as to deserve a somewhat more ample relation than his mere literary rank would claim. But when it is remembered that he commenced authorship at forty-five, and that all his books were written during continuous ill-health, we shall be ready to recognise the ability as well as to admire the spirit of the author.

FLORENTINUS, a Roman jurist, whose prænomen is unknown. His period also is uncertain, but he lived after the Emperor Antoninus Pius, for he cites one of his Constitutions, and names him Divus ('Dig.' 41, tit. 1, s. 16). He is not mentioned by any of the jurists who are cited in the 'Digest,' a circumstance which seems to argue that he belonged to a later age than any of them, or was at least as late as any of them. He wrote eleven books of 'Institutiones,' from which there are a few excerpts in the 'Digest.'

FLOREZ, ENRIQUE, a laborious contributor to the elucidation of Spanish history, was born at Valladolid on the 14th of February 1701, entered the order of Augustin monks in his fifteenth year, and after having published a course of theology, as professor of the science at Alcalá, devoted himself to a series of historical labours, which was only closed by his death at Madrid in 1778. His first historical work was his 'Clave Historial,' a compendium of universal history, published in 1743, which reached its tenth edition in 1780, not much to the credit of the Spanish reading public, as its merits are small and it is strongly tinged with bigotry and prejudice. Fortunately for his reputation, Florez's other works are of a kind in which he was better qualified to excel. The most celebrated is the 'España Sagrada,' a work, which like the 'Italia Sacra,' of Ughelli, and the 'Gallia Christiana' of Sainte-Marthe, was to exhibit the history of each diocese of the country, with a notice of its successive occupants. Had Florez confined himself to the execution of this plan on a moderate scale, he might probably, as he anticipated, have not only completed the work, but followed it up with a similar compilation relating to the Spanish dioceses in the east and west. But he allowed himself to be so diffuse on collateral subjects, that at his death, at the age of seventy, the work which had advanced to its twenty-seventh volume, was far from complete. It was continued by two other Augustin monks, Risco and La Canal, and the last volume which has appeared is the forty-seventh, issued in 1850, under the editorship of Sainz de Baranda, at the expense of the Spanish government, which had been memorialised by the Academy of Uisburg in 1835, at the time of the dissolution of the religious houses, to take the 'España Sagrada' under its patronage, as "a work classical of its kind, and enjoying a European reputation." Its chief value in the eyes of foreigners consists in its numerous appendices in which ancient chronicles are often printed at length, which are not to be found elsewhere. Florez was also the author of 'Memorias de las Reynas Catolicas,' or 'Lives of the Queens of Spain' (2 vols., 4to, 1770), containing plates of the costumes of the queens, which, singularly enough are omitted in a work on the same subject by a lady, the 'Annals of the Queens of Spain,' by Anita George (New York

1850). His 'Medallas de las Colonias de España' (3 vols. 4to, Madrid, 1757-73), treats of the period of ancient history only when Spain was occupied with Roman colonies. There are two portraits of the author, one bearing the date of 1760, and the other of 1773, which are usually inserted in the first and last volumes.

FLORIAN, JEAN-PIERRE-CLARIS DE, was born of a noble family in the Château-Florian, in the Cevennes, in 1755. His education was superintended by his grandfather; but, on his dying deeply in debt, Florian was obliged to look around him for some means of support. The Marquis de Florian, his uncle, who had married a niece of Voltaire's, took young Florian to Ferney, where the philosopher spoke encouragingly of his talents. In 1768 he became page of the Duc de Penthièvre, and finding that he had a passion for the army, that nobleman gave him a company of the dragoons de Penthièvre. He shortly afterwards retired from active service, and accepted the place of gentleman in ordinary to the duke, who treated him as a friend. Having now an opportunity of devoting himself to literature, he produced in 1783 the romance of 'Galatée,' in imitation of the novels of Cervantes. His mother being a Castilian, he was perfectly familiar with the Spanish language. 'Galatée' was followed by the well-known 'Numa Pompilius,' published in 1786. The pastoral romance of 'Estelle,' which was produced two years afterwards, and was reckoned by critics his best production, caused but small sensation at the time. He also brought out a collection of fables and a number of little comedies, in the Italian style, with Arlechino for their hero, which were very successful. In 1791 he published his romance 'Gonzalve de Cordoue,' which was preceded by an historical notice of the Moors. In 1793 he was banished from Paris by the decrees published against the nobility, and retired to Socaux, the inhabitants of which received him with cordiality, as, in conjunction with the Duc de Penthièvre, he had always been their benefactor. He was afterwards arrested, and confined in the prison called Port Libre, but was soon liberated. His health was so affected by anxiety, that he died in 1794, having, during his incarceration, written the romance of 'Guillaume Tell.'

Florian seems to have been a writer who did little else than imitate, in an inferior manner, the authors who had preceded him. 'Galatée' is an imitation of Cervantes; 'Numa' of Fenelon's 'Telemaque'; and the fables, of those of La Fontaine. His fables, which are well spoken of by La Harpe, contain some very neat and accurate descriptions; indeed, as a fabulist, La Fontaine is alone his superior. The translation of 'Don Quixote,' which is a posthumous work, is censured for its want of humour.

FLORIS, FRANS, or FRANS DE VRIEND, a celebrated Flemish painter, whom Vasari terms the Flemish Raffaele, was born of a good family at Antwerp, in 1520. His father, Cornelis de Vriend, was a sculptor, and Frans in his earlier years followed his father's profession. He learnt painting under Lambert Lombardus at Liège, and studied afterwards the works of Raffaele, Michel Angelo, and the antique, for some years at Rome. He returned with a great reputation to Antwerp, and formed a numerous school there. He was the most distinguished painter in the Netherlands in the time of Charles V. and Philip II.; but he injured his prospects by his notorious love of wine, which he habitually took to excess; in fact, he had the reputation of being as great a drunkard as a painter. He died at Antwerp in 1570.

Van Mander and Descamps mentions several works by Floris which are now lost; but there are still some excellent works by him in the Netherlands, and there are others in the galleries of Vienna, Dresden, and Berlin. One of his best works is a Nativity, in the cathedral at Antwerp. It is described by Sir Joshua Reynolds as well composed, well drawn, and well coloured; Sir Joshua admired also his 'Crucifixion,' at the Recollets. Floris etched a few plates, and some of his designs were engraved and published by Jerome Cock.

(Van Mander, *Leven der Schilders*; Descamps, *Vie des Peintres Flamands, &c.*)

FLORUS, LUCIUS ANNÆUS, a native of Spain, or, according to others, of Gaul, lived under Trajan and Hadrian. Some have supposed him to be the same as Lucius Julius Florus, who lived under Augustus, and to whom Horace has addressed two of his Epistles; but as, in the proemium to his history, Florus speaks of Trajan, he cannot be the same person as Lucius Julius, unless we suppose the passage to be interpolated. This question has been discussed by Titze, 'De Epitome Rerum Romanorum,' 1804. Others have supposed Florus the historian to be the same as Julius Florus or Florinus, who lived under Hadrian, and wrote the 'Pervigilium Veneris,' a pretty poem in imitation of Horace's 'Carmen Seculare'; but the identity of the two writers is very doubtful. Lucius Annæus Florus wrote a small work entitled 'Epitome de Gestis Romanorum,' in four books, from the foundation of the city to the closing of the Temple of Janus by Augustus. The author compiled his epitome from Livy and from other historians whose works are lost. It is meagre and declamatory, and is less a history than a panegyric of the Roman people. Florus is also incorrect in his chronology and geography. It must be observed however that the text, as we have it, is corrupt and interpolated. The work is of some use as a kind of substitute, however poor, for those books of Livy which are lost. Some manuscripts attribute to Florus also the Epitomes, or heads of contents, of the books of Livy.

FO-HI, the name of the first emperor of China, is said to have been

born in the province of Shensi, and to have reigned B.C. 2952. According to the Chinese historians, Fo-hi reclaimed the inhabitants of China from barbarism, established social order, instituted marriage, and taught them the use of writing. Fo-hi and his two successors Shin-neong and Hoang-ti, who are usually termed the 'Three Emperors,' must be considered as belonging to the fabulous part of Chinese history. He is said to have been the author of one of the canonical books of the Chinese, called 'Yé-king.' (Du Halde, *Description de l'Empire de la Chine*, vol. i. p. 266-269; vol. ii. p. 344-353.)

FOHR, CARL PHILIPP, a landscape painter of great ability and greater promise, was born at Heidelberg in 1795. In 1816 he visited Rome, and made the acquaintance of Cornelius, Veit, Overbeck, and Koch the landscape painter, and he shortly painted two large pictures there, which ranked him among the first painters of his class, and procured him the notice, patronage, and friendship of Ludwig I., the late king of Bavaria, then crown-prince. This ardent friend of German artists was strongly impressed with Fohr's ability; on taking leave of him at Rome, he pressed his hand, saying, 'Wir sehen uns wieder; wir gehören uns näher an' (We shall see each other again, we belong nearer to each other). It was not so, however; Fohr was drowned in the Tiber while bathing, on June the 29th, 1818, in the sight of three friends, who could afford him no assistance. Several of his early landscapes are in the museum at Darmstadt; a Life of him was published at that place in 1823; his portrait has been engraved by Amaler, one of the friends who witnessed his death.

FOIX, GASTON III., COUNT DE, Viscount de Béarn, was born in 1331. He was the son of Gaston II., by Eleanor, daughter of Bernard V., count de Cominges. From his personal beauty, or his fondness for the chase, he was called Phœbus, on which account, agreeably to the fashion of his day, he took the sun for a device. His father died when he was twelve years old, leaving him under the guardianship of his mother. In 1345 he made his first essay in arms against the English in Guienne, and served afterwards in Languedoc, where, and in Gascony, he subsequently became the king's lieutenant. In 1349 he married Agnes, daughter of Philip III., king of Navarre. In 1356, being suspected of holding criminal intelligence with his brother-in-law Charles the Bad, he was arrested by order of King John, and sent to the prison of the Châtelet at Paris; but, being released soon afterwards, he went to Prussia to serve against the infidels. In 1358, during the revolt called the Jacquerie, he aided in the rescue of the Dauphin, whom the Parisians had shut up in the market-place of Meaux, and in the same year made war upon his relative the Count d'Armagnac, who had set up pretensions to the viscounty of Béarn, and whom he afterwards took prisoner, in 1372, at the battle of Launac. Gaston, who had become discontented with his wife, upon a dispute about her dower, parted from her in 1378. In 1380, the government of Languedoc becoming vacant by the recall of the Duke of Anjou, it was bestowed by Charles V. on the Count de Foix. He held it however but a few months. Charles V. dying on September 16th of that year, Charles VI. revoked the appointment, and gave it to the Duc de Berri. The Count de Foix appealed to arms, and finally yielded up the government only on negotiation. By his marriage the Count de Foix had but one son. This youth, in 1382, paying a visit to his mother, who had retired to the court of her brother, Charles the Bad, received from that king (to whom crime was familiar) what he pretended was a bag of love-powder, which that king told him to conceal, at the same time informing him that the sprinkling of a small quantity of it on any food his father might eat, would have the effect of reconciling the count to his wife. The powder turned out to be a strong poison, and Gaston ordered his son to be arrested. The young prince, deceived but not guilty, refused all nourishment, and died in his prison; the father, as Froissart relates, having hastened his death when going to remonstrate with him, by accidentally striking the point of a knife into his son's throat as he pushed aside the tapestry which covered the entrance to his dungeon.

In 1390 Gaston received Charles VI. and his whole court at his castle of Mazères, in the diocese of Mirepoix, where he not only entertained them with great magnificence, but made the king the heir to his domains. He died of apoplexy in the beginning of August 1391, as his attendants were pouring water on his hands at his return from a bear-chase.

Historians, especially Froissart, have painted Gaston as an accomplished, brave, affable, and magnificent prince: they cannot however deny that he was violent to excess. His conduct towards his son, and to De Berne, the governor of the castle of Lourdes, whom he wished to force to deliver the place to the French, and whom, on his refusal, he struck several times with his poniard, are incontestable proofs. His favourite passion was hunting. He carried it to such extreme, that if we may believe Saint-Yon, he did not keep fewer than sixteen hundred dogs. He also composed a work on what constituted the object of his affection, entitled 'Phebus des deuidz de la Chasse des Bestes sauvages et des Oyseaulx de proye,' three or four editions of which are known; viz., fol. Par. by Verard, without date; another by J. Treperel, 4to, by Phil. le Noir, without date; and 1515, and 1520. The book of 'Phebus' is also included in several of the early editions of the Treatise on Hunting by Jaques de Fouilloux.

It was in the castle of Orthes, Gaston's principal residence, that

Froissart, who staid there a considerable time, heard many of the best stories with which his history is embellished. The portrait which he has drawn of Gaston is one of the completest pictures of what a chivalrous prince was in the time of our Edward the Third.

FOLARD, JEAN-CHARLES DE, was born at Avignon in 1669. He entered early into the army, and distinguished himself by the attention which he paid to the scientific part of his profession, to the movements and manœuvres of an army in the field: he drew plans and maps, and became a pretty good engineer. Having been made aide-de-camp to the Duke of Vendôme, he attended him in his Italian campaigns, and was wounded at the battle of Cassano. He afterwards served in Flanders under the Duke of Bourgogne, and was wounded again at the battle of Malplaquet. His zeal, at times indiscreet, his want of tact, his restless activity, and his fondness of giving advice, which, although at times valuable, was not acceptable to his superiors, made him many enemies. The peace of 1712 having placed him on the reduced list, he repaired to Malta to offer his services to the order of St. John, which was then threatened by the Turks; but being offended at some real or supposed slight, he returned to the continent, and visited Sweden, where he was well received by Charles XII, who employed him on some missions, and whom he accompanied in his expedition to Norway. After Charles's death in the trenches of Frederichshall, Folard returned to France, and made one short campaign more in the war against Spain of 1719, after which he withdrew into private life, and occupied himself in writing on military matters. He died at Avignon in 1752.

Folard's principal work is his 'Commentaries on Polybius,' in which he not only makes his observations on the events narrated by the Greek historian, but also draws parallels between ancient and modern military practices, and reasons on the occurrences of the wars which he had witnessed, exposing with the greatest freedom the errors of the various commanders of his own age. His disquisitions, though often prolix, are valuable. Folard's 'Commentaries' were published in 6 vols. 4to, Paris, 1727-30, and again at Amsterdam, in 7 vols. 4to, the seventh volume containing some treatises and strictures on Folard's system of tactics, with his own replies.

FOLEY, JOHN HENRY, A.R.A., was born at Dublin, May 24, 1818. His attention being early directed towards art, by a near relative who was a sculptor in the Irish metropolis, young Foley entered the drawing and modelling schools of the Royal Dublin Society, at the age of thirteen. Having gained the first prize in each of the classes he attended there, he in 1834 came to London, and entered as a student at the Royal Academy. He first appears as an exhibitor at the Royal Academy in 1839, when he sent models of 'Innocence' and 'The Death of Abel,' both of which were much admired. In the following year he contributed a model of 'Ino and the infant Bacchus,' an admirable group, full of playful fancy and the nicest refinement: it at once established the reputation of the young sculptor. The marble group, now the property of the Earl of Ellesmere, was even more admired than the clay model; and a reduced copy of it has formed one of the most popular and widely distributed of the favourite parian statuettes.

Mr. Foley's principal imaginative works subsequent to the 'Ino and Bacchus' have been 'Lear and Cordelia,' and 'The Death of Lear,' 1841; 'Venus rescuing Æneas,' 1842; 'Prospero relating his Adventures to Miranda,' 1843; 'Contemplation,' 1845; 'Innocence,' 1846; 'The Mourner,' 1849; 'The Mother,' 1850; 'Egeria,' 1856. Of late, as will have been noticed, Mr. Foley's ideal efforts have been few and unambitious. In fact, as soon as he attained celebrity, he grew in request for portrait busts and monumental memorials, and the ideal has been neglected as less profitable than the actual. Among the more important of Mr. Foley's productions in this line may be mentioned his monumental composition in Milford Church, Hants, to the memory of Admiral Cornwallis and Captain Whitby; one of the figures of which, 'Grief,' was exhibited at the Royal Academy in 1862; his Wellington memorial; monument to the Honourable James Stuart at Croydon; the statue of John Hampden at the New Palace of Westminster; and his busts of Viscount Hardinge, Miss Helen Faucit, &c. Mr. Foley was elected an associate of the Royal Academy in 1850. Unquestionably one of the very best of our younger British sculptors, Mr. Foley may fairly be ranked among those most promising to do honour to the artistic fame of this portion of our history. Without being tied down by any idle adherence to classic precedents he has a fine classic spirit, considerable invention, a refined taste, and much executive skill; and if he only gives his imagination fair scope he ought to produce some really great work.

FOLKES, MARTIN, an eminent English antiquary, was the eldest son of Martin Folkes, Esq., and was born in Great Queen-street, Lincoln's-Inn-Fields, October 29th, 1690. He entered of Clare Hall, Cambridge, in 1707, where his progress in all branches of learning, and more especially in mathematics and philosophy, was such, that when he was scarcely more than twenty-three years of age he was admitted a Fellow of the Royal Society, and two years after had so distinguished himself as to be chosen one of its council. His first communication to the Society was on the aurora borealis of March 30, 1717. This was followed at various times by other papers in considerable numbers, for which it may be sufficient to refer to the 'Philosophical Transactions.' He was chosen a second time of the council of the Royal

Society in 1718, and continued to be re-chosen every year till 1727; Sir Isaac Newton, the president, having in 1723 appointed him one of his vice-presidents. In February 1720 he was elected a Fellow of the Society of Antiquaries.

At the first anniversary election of the Royal Society after the death of Sir Isaac Newton, in 1727, Mr. Folkes was competitor with Sir Hans Sloane for the office of president, and his interest was supported by a great number of members, though the choice was determined in favour of Sir Hans. He was however again chosen of the council in 1729, and continued in it till he was advanced to the president's chair twelve years after. In the meantime he was, in 1738, appointed one of the vice-presidents by Sir Hans Sloane. In this year he set out with his whole family on a tour to Italy, and, after residing a considerable time both at Rome and Florence, returned to England in September 1735. The opportunities which he had of consulting the best furnished cabinets of Italy enabled him to compose there an excellent 'Dissertation on the Weights and Values of ancient Coins.' This was read in the Society of Antiquaries, who requested that a copy of it might be registered in their books, which he promised to give after he had revised and enlarged it; but, for some reason, this was never done. In the same year however, 1736, his 'Observations on the Trajan and Antonine Pillars at Rome' were read in this Society, and afterwards printed in the first volume of their 'Archæologia,' which contains another paper by him on the brass equestrian statue of Marcus Aurelius at Rome, occasioned by a small brass model of it being found near London. In April he also communicated to them 'A Table of English Gold Coins from the 18th year of King Edward III., when Gold was first coined in England, to the present time, with their Weights and intrinsic values;' which at their desire he printed the same year in 4to; and in 1745 reprinted it with additions, prefixing a larger and more considerable work, entitled 'A Table of English Silver Coins, from the Norman Conquest to the present time, with their Weights, intrinsic Values, and some Remarks on their several Pieces.' Mr. Folkes, in order to illustrate this work had set about engraving, and actually did engrave, 42 copper-plates of English silver coins, which were left at the time of his death in an incomplete state. These, together with the copyright of the books or tables before mentioned, were purchased by the Society of Antiquaries, December 19th, 1754, for 120*l.*, and the whole published, with great additions, both as to letter-press and plates, under the care of Dr. Andrew Gifford, in 1763.

Mr. Folkes succeeded Sir Hans Sloane as president of the Royal Society in 1741; and, in the following year, was chosen to succeed Dr. Halley, as a member of the Royal Academy of Sciences at Paris. In 1746 the University of Oxford conferred upon him the degree of LL.D., and he was afterwards admitted to the same degree at Cambridge.

In February 1750 Mr. Folkes, then one of the vice-presidents, succeeded the Duke of Somerset as president of the Society of Antiquaries, an office in which he was continued by the charter of incorporation of that Society, November 2, 1751. But he was soon disabled from presiding in person, either in that or the Royal Society, being seized on September 26th of the same year with a palsy, which deprived him of the use of his left side. He languished till a second stroke put an end to his life, June 28th, 1754.

(Nichols, *Anecdotes*, li. 588; and *Bowyer Anecdotes*, pp. 562-66; Chalmers, *Biog. Diet.*, vol. xiv. pp. 428-31.)

FONBLANQUE, ALBANY W. Those who have been familiar with the columns of the 'Examiner' for a quarter of a century, will have no doubt that the chief contributor to that journal must take rank with the most able and influential writers of his time. Mr. Fonblanque was born in 1797, the son of John de Grenier Fonblanque, distinguished as an equity lawyer. Albany Fonblanque, being intended for his father's profession, was a pupil of Mr. Chitty; but he was never called to the bar. He was unwilling to add to the number of those who have sung or said 'The Lawyer's Farewell to his Muse;' and he abided by the path he had chosen of bringing the acuteness of his intellect to the consideration of political questions. His earliest articles were written on the break-up of the Liverpool administration, and the accession of Canning to power. The 'Examiner' was, from its first establishment, a journal far above the average talent of weekly newspapers. The liberal politics of its proprietors and editors, John and Leigh Hunt, at a time when liberal politics were dangerous as well as unfashionable, gave it a circulation amongst independent thinkers; and its critical articles on literature and art, when newspaper criticism was little better than careless puffery or personal bitterness, ensured it a wider reputation. When this paper passed out of the hands of its original conductors, it was fortunate for its character that one so ably qualified as Mr. Fonblanque should succeed to its proprietorship and management. Until the last few years, and occasionally at the present time, the attention of the political reader has been arrested, either in the 'Examiner' itself, or by copious extracts in other journals, by articles so marked by strong sense, and yet so playful and amusing—so unrivalled in their command of the most odd yet most appropriate allusions derived from the minutest acquaintance with English and foreign literature—so biting in their satire and so brilliant in their wit—that the gratification has very often been accompanied with the regret that such rare powers should be bestowed upon ephemeral subjects. Such regret

would be neutralised by the consideration that some of the most characteristic papers of Swift—upon whom probably some of the peculiarities of Mr. Fonblanque's style are founded—equally deal with matters whose interest is now wholly passed away, except as manifestations of the rare skill which has given them a long vitality. It is always interesting to see how passing topics, which gradually grow dim as they recede into the historical distance, were viewed under the strong light of contemporary judgments, expounded by men of remarkable talent. Those who would judge how the political circumstances of this country were viewed at a time when every great improvement which distinguishes the present age was struggling with the most inveterate prejudice and the most fiery opposition, should read Mr. Fonblanque's 'England under Seven Administrations,' published in 1837. This is a selection of his articles from the 'Examiner.' They will thence learn also, how surely, however gradually, public opinion is formed under the constant vigilance of a free press; and how large a measure of gratitude is due to those who, possessing the high responsibilities of the journalist, wield the powers of great abilities and established reputations, for the advancement of real improvement without wild innovation; and for the destruction of evil principles and gross abuses, without resorting to that personal defamation which was the chief weapon of those who once laboured to oppose all national progress. In 1852 Mr. Fonblanque was appointed Director of the Statistical Department of the Board of Trade, vacant by the death of Mr. Porter—an office of great public usefulness thus properly bestowed upon a man of letters. In the conduct of the 'Examiner' Mr. Fonblanque was for some years assisted by Mr. John Forster; and under that gentleman's responsible editorship, since 1846, the paper has fully maintained its reputation for vigour and honesty, for brilliancy of style, and soundness of judgment.

FONTAINE, JEAN DE LA, was born in 1621 at Château-Thierry, where his father was Maître des Eaux et des Forêts. No great attention was paid to his education, and it is said that he did not display any sort of talent till he had attained the age of twenty-two. His genius was first called forth on his hearing read an ode by Malherbe, when he is reported to have exclaimed, "I also am a poet!" At first he took Malherbe for his model, but afterwards turned his attention to the works of Rabelais, Voiture, and Clement Marot. His father, delighted with his imitations of his favourite authors, thought him a prodigy of poetic genius, and a relation advised him to study the classics. A translation of Terence's 'Eunuch,' published by La Fontaine in 1654, was the fruit of this advice. He was much delighted with the Italian authors, especially Machiavelli, whom he chiefly admired for his little novels. On the death of his father, he succeeded to his office, which he filled inefficiently, and took a wife, with whom he lived unhappily, and from whom he finally separated. In fact, he was of too indolent and improvident a disposition for any of the common avocations of life; he does not seem to have had any absolute vice, but to have gone on in his own lounging way without taking any interest in what was passing around him. In an epitaph on himself he describes his life as having been occupied with sleeping and doing nothing; in the latter category he evidently includes the writings of his poems, which he probably threw off when in a happy vein without giving himself any great exertion. Some verses of La Fontaine happening to fall in the way of the exiled Duchesse de Bouillon, who was residing at Château Thierry, she caused the author to be introduced to her, and took him with her to Paris when she returned. Here the superintendent Fouquet became his Mécène, and placed his name on a list of pensions which he allowed to various persons of merit. On the exile of this minister La Fontaine wrote a pathetic elegy. Though many distinguished persons honoured him with their patronage, his ignorance of the world and his habitual carelessness would have plunged him into difficulties had not a liberal lady, Madame Sablière, taken him into her house, where he resided for twenty years in perfect tranquillity. A well-known story gives a good idea of La Fontaine's quiet lazy disposition. Madame Sablière having had occasion to part with her servants, said to a friend, "I have now got rid of all my animals but three—my dog, my cat, and La Fontaine."

In 1684 he was received into the Academy as successor to Colbert, not without opposition from the graver sort, on account of the licentiousness of some of his works. However he triumphed over Boileau, who was the rival candidate. The king, indignant at this, delayed giving assent to his admission, but on the death of M. Bezons, and the election of Boileau to fill his place, the king expressed his approbation of the choice of La Fontaine. On the death of his benefactress, La Fontaine was again reduced to difficulties, and would have been forced to accept an offer of St. Evremond to take him to England, had not the Duke of Burgundy assisted him. In 1692, when he became seriously ill, the Abbé Pougit paid him a visit to attend to his spiritual welfare. La Fontaine submitted to the dictates of the abbé, though he was somewhat restive on two points. In the first place, the abbé demanded a public apology for his licentious tales; in the second, a solemn promise not to give to the actors a comedy which he had written. He made the required apology, but he applied to the Sorbonne before he yielded to the second demand; however, receiving an unfavourable answer, he committed the comedy to the flames. In 1693 La Fontaine became worse, and was even

reported dead; but he recovered, and devoted himself to a translation of the hymns of the church and other religious works. He would now have been almost alone in the world, if a friend, M. D'Hervart, had not kindly offered him an asylum in his own house. He died in 1695.

The works by which La Fontaine is known are his Tales and his Fables. The former have a very equivocal set of readers, and are seldom mentioned in society; the latter belong to that small class of works the reputation of which never fades, and which are almost as well known at present as they were in the 17th century. Innumerable are the editions of these fables, and great is the field they have offered for the ingenuity of artists in furnishing illustrations. To say nothing of the various unornamented editions, they appear in every variety of shape, from an 18mo with vignettes to a huge folio with large and elaborate plates. It is remarkable that La Fontaine never (or rarely) invented his subjects: his tales are taken from Boccaccio, Machiavelli, Ariosto, and others; his fables are chiefly selected from Æsop. It is not the matter of his compositions, but the manner in which he tells a tale, that constitutes his merit. His narrative is marked by that ease and grace which are to be perceived, not described. Curiosity will cause a reader to wade through a new story even when indifferently written; but a man who, by his mere manner of narrating, can make a vast number of readers peruse a series of narratives, with every incident of which they are perfectly acquainted—must have talents great indeed.

FONTAINE, PIERRE-FRANÇOIS-LEONARD, was born at Pontoise, department of Seine-et-Oise, France, in 1762, and through a life of unusual duration, was associated with many of the chief buildings of his country. He has been called the father of the modern French school of architects—though this may refer to his years more than to relation of style. He began the study of architecture under Peyre the younger; and here was formed with Charles Percier, one of his fellow students, an intimate friendship, broken only by the death of the latter, and an union of two artists both possessed of great though diverse talent, which largely operated upon architecture, and especially upon its departments, decorative and ornamental art. [PERCIER, CHARLES].

In 1785, Fontaine obtained the second grand prize for architecture; and, in consequence of the high merit of his work, was made a pensioner of the academy which the French maintain at Rome. There, in the course of their architectural studies, the French students select models from the ruins, which they measure and draw, designing the missing portions. Fontaine however undertook to present the restoration of the entire city of Rome, as it was in the time of the Cæsars. His drawings procured him an extraordinary prize of 3000 francs. Soon after his return to France, the revolution commenced. Fontaine, during the most terrible events of that time, passed over to England, and a few years elapsed ere he and his friend Percier could be called upon for any practical exemplification of their talent. But during the consulate, the friends were entrusted with the work of restoring the palace of Malmaison. On attaining the imperial dignity, Napoleon I. conceived some vast projects: he named Fontaine his architect, and required of him the restoration of all the palaces, and the completion of those of the Louvre and Tuileries. He also commanded the erection of the triumphal arch of the Carrousel, and the preparation of plans for a large palace which he proposed to have built for the king of Rome, upon the heights of Chaillot, but which was not completed. Such important works occupied Fontaine and Percier during the whole period of the empire. After the events of 1814 and 1815, Fontaine was named architect to the king, and he retained that position till the events of 1848. He then declined a similar position under the provisional government, by whom however he was made president of the Council of Civil Buildings.

Amongst his chief works during the reigns of Louis XVIII., Charles X., and Louis-Philippe, may be named the grand staircase of the Louvre, and the halls called after Charles X., the funeral chapel of the Rue d'Anjou-Saint-Honoré, and the complete restoration of the Palais-Royal. For the union of the Louvre and the Tuileries, projects had been prepared from 1800 by the chief French architects. The arch of the Carrousel, by Percier and Fontaine, was commenced in 1806, and in 1811 the plan of the same architects for the extension of the Louvre having been approved of, a building 700 feet in length was erected enclosing the Carrousel on the north side. In the reign of Louis XVIII., from 1820 to 1823, the new wing was extended 70 or 80 feet; but the reign of Louis-Philippe was occupied in other works; and the original project remained in abeyance till again taken up by the aid of another architect under the present emperor.

The manner of Percier and Fontaine was founded upon the study of the antique Roman architecture, of which character of art, the decorative sculptures of the Arc du Carrousel present admirable adaptations. Their work, published in 1812, entitled 'Recueil de Décorations Intérieures,' comprises designs for all kinds of furniture, and fittings for interiors of houses; and, together with their example, had a wide influence upon general taste. This has been since modified by more discursive study of models, especially those of the Renaissance period. Amongst their other publications were—one illustrative of the chief villas of Rome and its environs; illustrations of the ceremonies at the coronation, and at the marriage of Napoleon; plans of the palace

for the king of Rome, with plans of the palaces of foreign sovereigns compared; and a history of the royal residences. Fontaine was elected a member of the Institute of France in 1811, and at the time of his death was the senior member.

He died on the 10th of October 1853, in the ninety-second year of his age. In the later years of his life, he retired to a secluded quarter of Paris near Père-la-Chaise, where the remains of his friends Percier and Bernier reposed; here he surrounded himself with a collection of works of art, preserved his faculties to the last, and thence was attended to his grave by members of the Institute, by artists, and workmen of all classes; the architects of England being represented by Professor Donaldson, who was amongst those who pronounced eulogiums at the grave.

FONTANA, DOMENICO, a distinguished Italian architect, was born at Milli, on the borders of the Lake of Como, in 1543. Having a decided taste for mathematical studies, at the age of twenty he went to join his elder brother Giovanni, an architect, at Rome. Here he attracted the notice and obtained the favour of Cardinal Montalto, who confided to him the erection of the Cappella del Presepio, or Sistina, in Santa Maria Maggiore, a design of great nobleness and grandeur, although, according to modern taste, too overcharged in its ornaments, and too much cut up by the injudicious arrangement of the gilding and coloured marbles. By the same ecclesiastic he was employed to build for him, in the vicinity of the above-mentioned church, the palace now known by the name of the Villa Negroni. This edifice which, partly on account of its gardens, was for a long while one of the most celebrated mansions in Rome, is, like most of the architect's other designs of the same class, exceedingly simple in its composition, and has little decoration beyond what it derives from the dressings and pediments of the windows, which latter are alternately angular and curved. Yet favourable as these undertakings were in themselves, they were not productive of much immediate profit to the architect, and were even injurious to his patron, as they afforded the pope (Gregory XIII.) a pretext for suppressing the pensions of the cardinal, since he was wealthy enough to indulge in such magnificence. On this, out of his attachment to the cardinal and his eagerness to complete the Cappella del Presepio, Fontana generously contributed a thousand scudi of his own, rather than see the scheme abandoned. To his disinterestedness on this occasion he was in all probability not a little indebted for his subsequent good fortune, as the cardinal was shortly afterwards elected to the pontifical throne under the well-known name of Sixtus Quinto. The new pope had now the means of indulging his taste for architecture and embellishment, and one of his projects was to re-erect the various Egyptian obelisks which lay scattered and neglected among the ruined fabrics of the ancient city. The first to which the pope directed his attention was that which still remained standing in the Vatican circus. This he was anxious to have removed to the area in front of St. Peter's; but the practicability of transporting such an enormous mass (83 feet 2 inches high), and elevating it upon a pedestal, was long doubtful, although the ablest mathematicians and engineers were summoned to suggest the means. Upwards of five hundred different projects and models were submitted to him, nor did Fontana fail to come forward among the competitors, and he gave satisfactory proof of his contrivance by applying it to a small obelisk in the mausoleum of Augustus. Eventually the carrying it into execution was intrusted to Fontana, although it had been in the first instance determined that Giacomo della Porta and Ammanati should take charge of the operations. A circumstantial account of all the proceedings attending this very arduous enterprise was published by the architect himself, under the title of 'Del modo tenuto nel trasportare l'Obelisco Vaticano.' The operations commenced April 30th 1586, and the obelisk was removed and placed on the new pedestal prepared for it on the 13th of the following June, when was successfully accomplished the most stupendous trial of mechanical skill that age had then witnessed, although since several times rivalled. The complete success of this task gained the architect not only honours and distinction, but a pension of 2000 scudi, and also gave him assurance of an equally favourable result in all similar undertakings. To these belong the three obelisks he afterwards erected in the Piazza del Popolo, before St. Giovanni Laterano, and in front of Santa Maria Maggiore. The second of these is still larger than the first-mentioned, being 105 feet 7 inches high, independently of the pedestal, and its weight calculated at about 440 tons.

In addition to tasks of this nature, Sixtus afforded him the opportunity of displaying his talents as an architect, giving him charge of the various works at the Lateran church, to which he attached, on one of its sides, a kind of portico consisting of an upper and lower gallery, in five open arcades, the piers of the former ornamented with a Doric and those of the other with a Corinthian order. Immediately adjoining this portico he also erected the palace of the Lateran, a uniform square pile of building, with two series of windows above the lower floor, all of which have pediments alternately angular and curved, and the whole is surmounted by a massive and rich cornice. By the same pontiff he was likewise charged to construct the Vatican library, and thus destroy the noble court formed by Bramante. He also erected the lofty mass of building on the side towards the piazza of St. Peter's, which, impressive as it is in itself, does not bespeak much fertility of invention, it being little more than a repetition of

his palace of the Lateran. Another papal residence, which was partly erected by him, was that of the Quirinal, or Monte Cavallo, so called from the two colossal figures before it, which he removed thither from the Baths of Constantine. Among his other works may be mentioned the restoration of the columns of Trajan and Antoninus, and the fountain of Termini. He was preparing to erect a vast edifice for a cloth manufactory within the Coliseum, the plan of which was to have been elliptical like that of the amphitheatre, when Sixtus, with whom the idea originated, died; and thus was frustrated a scheme that would irreparably have injured the sublime and majestic character of that great monument of antiquity.

The death of that pope brought a change of circumstances to Fontana, who was dismissed by Clement VIII. from his situation as papal architect. Still his prosperous fortune did not desert him, for he was immediately invited to Naples by the viceroy, the Count de Miranda. In that capital, to which he repaired in 1592, he was employed on a variety of works, and among others he executed the fountain Medina; but the most important of them all was the royal palace, a grand and imposing, although not particularly elegant edifice. He died in that city in 1607, possessed of considerable wealth, and of a distinguished reputation.

FONTANA, PROSPERO, a celebrated painter of Bologna, where he was born in 1512. He was the pupil of Innocenzio da Imola, the assistant of Del Vaga and Vasari, and the master of the Caracci; and was of great authority in Bologna until the establishment of the school of his pupils. As a fresco-painter Fontana was a mere machinist, but in portrait-painting he was one of the first painters of his time. There are frescoes by him at Bologna, at Rome, and at Città di Castello, where in a few weeks he painted a great hall in the Palazzo Vitelli, illustrating the deeds of that family. He was presented by Michel Angelo as a good portrait-painter to Giulio III., who took him into his service, as did also his three successors. Fontana died at Rome in 1597.

LAVINIA FONTANA, called also ZAPPI, the name of her husband, was the daughter of Prospero, and likewise distinguished herself for her ability in painting, especially in portrait; but she executed works in various departments of painting, all finished with care and delicacy. Some of her portraits have passed for the works of Guido. She was a great favourite with the noble ladies of Rome from the time of Gregory XIII. to Paul V.: she painted Gregory's portrait. She died at Rome in 1614, aged sixty-two.

FONTANES, LOUIS DE, was born at Niort, in the department of Deux Sèvres, March 6, 1757. His father, a Protestant, having, though of noble rank, only the scanty income derived from his office of inspecteur de commerce, was under the necessity of sending him to a village school near Niort; but the extreme diligence of the boy enabled him to make much progress. He afterwards finished his education with equal ardour, and better opportunities, at the college of his native town. At the age of sixteen Fontanes had written many fugitive verses, noticeable only for the purity of their language and their fluent versification.

In 1777, having had the misfortune to lose his father and a brother, whose tastes were akin to his own, he removed to Paris, and in the following year appeared for the first time as an author with his poem 'La Forêt de Navarre,' which was well received, and procured him several friends, particularly the tragic poet Ducis. His translation of Pope's 'Essay on Man' appeared in 1783, and though the verses were not considered adequate to the subject, the preliminary discourse met with general approval. There are many portraits of eminent writers in this preface; those of Voltaire and Pascal have been especially admired. 'Le Verger,' another poem, was published in 1788; and 'L'Essai sur l'Astronomie' in 1789.

The revolution broke out in this year, and Fontanes feeling that the time was no longer suitable to poetry, became a journalist. About two years after, the animosity manifested against the nobles drove Fontanes from the capital. He took shelter in Lyon; but the arrival of Collet d'Herbois in that city, in 1793, compelled him to fly from it, and to wander homeless and friendless from one place to another. But after the 9th Thermidor (July 28, 1794), the Convention founded the Institute, and Fontanes was included in the list of its members. He was appointed Professor of Belles-Lettres to the École Centrale des Quatre Nations in 1795. He still continued to write for the newspapers, and assisted La Harpe, in 1796, in writing for the 'Mémoires,' a literary and political paper, which took the side of the Bourbon family. His connection with this paper caused him to be set down in the long roll of disaffected authors, which Barras and Bonaparte pressed into the conspiracy of the 18th Fructidor; his name was expunged from the Institute, and he was condemned to transportation to Cayenne. He however escaped to England, and in London joined his old friend Chateaubriand.

After the 18th Brumaire (1799), Fontanes ventured to return to Paris, where he lived in great seclusion, until the First Consul, requiring a competent author to write the éloge on Washington, then recently deceased, Maret, his secretary, recommended Fontanes, who was commissioned to do it—his name being withdrawn from the list of transports for the purpose. He had but six days allowed him for this important task: it was completely successful, and became the turning point in his fortune. He was reinstated in the Institute, and

made director of the 'Mercure de France.' His polished manners produced a favourable impression on Bonaparte, who made him a frequent guest at his table, and gave him one of the private cards, which entitled the bearer to immediate access to him. Fontanes likewise became a favourite with Lucien Bonaparte, and Eliza, Madame Bacciocchi.

In February 1802 he was appointed a member of the Corps Legislatif, and became its president in 1804. Fontanes has been reproached with his subservience to Napoleon I., and has been charged with constant adulation of his measures and acts. But it is well known that in private he often refused to sanction with his approbation the violent and arbitrary conduct of his benefactor. For two years after the execution of the Duc d'Enghien, the emperor urged the courtier in vain to admit at least that the sacrifice was necessary; and failing of that, removed him from his presidency of the Corps Legislatif, February 5, 1810, and created him a senator. He had already been installed as grand-master of the university in September 1808, and created a count about the same time. On the 1st of April 1814, the Count de Fontanes voted for the dethronement, or forfeiture, of Napoleon I., gave in his adhesion to the Provisional Government on the 6th, and was confirmed in all his appointments.

During the Hundred Days, in 1815, the Count de Fontanes lived in retirement; and after the return of Louis XVIII. he was made president of the electoral college of the Deux Sevres. He died of apoplexy March 17, 1821, at the age of sixty-four. His name will remain associated with the reign of Napoleon I., but his famous addresses, annually delivered in reply to the speech from the throne, so much admired at the time for their eloquence and purity of style, are already passing into oblivion.

Besides the works already mentioned, M. de Fontanes was the author of 'La Chartreuse de Paris,' 'Les Livres Saints,' 'Stances à M. de Chateaubriand,' 'Le Retour d'un Exilé,' &c.

FONTENAY, THERÈSE DE CABARRUS, MARQUISE DE, was born in 1778 at Saragossa, in Spain. All that is known of her early youth is, that she was even then admired for her wit, fascinating manners, and remarkable personal beauty, for which she was distinguished through life. In 1789, at the age of sixteen, she married M. Devin, marquis of Fontenay, a councillor of the third Chambre des Enquêtes, in the parliament of Paris. The great disparity between her age and that of her husband, and the attentions she received, led to disputes between them, and in 1793 Madame de Fontenay left Paris with her only child to rejoin her father, in Spain. But on reaching Bordeaux, she was arrested and thrown into prison, because, although provided with a passport, she had not a 'carte de sûreté,' at that time indispensable. In her distress she wrote to Tallien, who was then on a mission to Bordeaux with two other proconsuls, Ysabeau and Baudot. Her application was successful; she was released, and a connection which lasted nine years thus originated. She soon became the most influential person in that city, and though little reliance can be placed on the accounts which charge her with having sold her ransoms like stock, there can be no doubt she opened the prisons to many captives and prevented many heads from falling. In 1794 she followed Tallien to Paris, and was immediately arrested and sent to prison. Here she first met with Madame Josephine de Beauharnais, afterwards Madame Bonaparte.

Alarmed by the increasing draughts from her own prison during the first three weeks in July, she wrote repeatedly to Tallien, upbraiding him with his indolence and want of spirit, and conjuring him to make an effort to save her. Stimulated by these letters, as well as by his own sense of danger, the young Dantonist drew together the various members of the Convention, who knew they were threatened, and on the 9th Thermidor Robespierre was overthrown. The prisons were then opened, and Madame de Fontenay, along with several thousand captives, was set at liberty.

On the 26th December 1794 she married Tallien, her first husband being still alive. They continued to live together until 1798, when Tallien accompanied Bonaparte into Egypt. Their harmony however had long been interrupted, and they were legally divorced April 2, 1802. On the 18th July 1805 she contracted a new marriage with the Count Joseph de Caraman, who became Prince de Chimay the same year. Her first and actual husband, the Marquis de Fontenay, was still alive and did not die until 1815. In consequence of this singularity, the church refused to admit the validity of her last engagement. For ten years she struggled in vain with the feelings of society, continued in Paris, and gave dinners, balls, and entertainments. The great families would not attend them, and many of the cards of invitation which she had addressed to them as Princess de Chimay, were returned to her as Madame de Septembre. This was in allusion to the massacres of September, in which Tallien had taken part.

At length she gave up the useless struggle, and retiring to Chimay, in 1816, she began to lead a life of modest tranquillity amidst her own family. In this peaceful retreat she continued until the 15th January 1835, when she died of a disease in the liver, from which she had been a severe sufferer for some years. Although in her sixty-second year, traces of that beauty which had once been so remarkable, were still visible.

FONTENELLE, BERNARD LE BOVIER DE, born at Rouen, 11th February 1657 was, by his mother's side, nephew of the great Corneille. Educated at the College of the Jesuits in his native city,

he displayed, at a very early period, the quickness and the aptitude of his talents, which he cultivated with the greatest diligence and application. At the age of thirteen Fontenelle successfully contended for the prize offered for the best composition in Latin verse; and in general literature had deserved honourable mention on the records of his college. From this time to his sixteenth year the law was the study to which his attention was nominally directed. But his heart was not with the science: poetry, philosophy, and history engrossed the time which should have been devoted to the Corpus Juris. During this period principally Fontenelle acquired those vast stores of varied and accurate knowledge which, giving an appearance of catholic learning to his works, are constantly recurring in the shape of apposite and almost unconscious allusions. Having completed the term of his legal studies, he lost the first cause in which he was retained, and thereupon abandoning for ever the distasteful profession of the law, devoted himself to the more attractive and congenial pursuits of literature.

In his private fortunes there is little to interest the curiosity so commonly felt respecting the doings of men of genius; the biographer has consequently little to do but to follow him in his literary career, which was neither without honour nor profit. For the last years of his life he was in the enjoyment of a yearly income of nearly 9000*l.*, and left behind him at his death a very considerable sum. From 1699 to 1741 he held the distinguished and responsible office of secretary to the Academy of Sciences at Paris, and was an honorary member of that of Berlin and of the Royal Society of London. Fontenelle died at Paris on the 9th January 1757, having completed his hundredth year within a few weeks, and expired exclaiming "Je ne souffrâs pas, mes amis; mais je sens une certaine difficulté d'être." The calmness with which he met his death was in keeping with the serenity of his whole life.

In his personal character Fontenelle presents a rare instance of self-command and moderation, neither confounding virtue with austerity nor pleasure with excess. To the measured reserve of his character there is a somewhat exaggerated allusion in his oft-repeated declaration, that in his whole life he had never laughed nor wept. As he held it to be the duty of the sage to cultivate all his senses, internal as well as external, and to combine in the enjoyment of all nature the exercise of all his faculties, the tone of his mind exhibited a happy harmony with his personal character. The universality of his pursuits, which embraced nearly the whole domain of literature, offered on the one hand an insuperable obstacle to unrivalled excellence in any single department, but contributed on the other, by enlarging his views and increasing his stores of knowledge, to render respectable his attainments in all.

As a poet, in which character he made his first appearance in the world of letters, he composed several tragedies and operas, most of which were unfavourably received; and if the 'Thetis et Pelée' met with some success and the praises of Voltaire, it has since fallen with the rest into neglect and oblivion. His Pastorals, which were recommended solely by their novelty, are full of extravagant conceits; on the other hand, there is much of nature and grace in the 'Ismène,' which, with the 'Apologie de l'Amour,' is alone worthy of being preserved. His poetic pieces occasionally display much delicacy of sentiment, and extreme polish and elegance both in the thought and diction; but in all of them the poetic feeling is weak, and there is little invention, and a decided want of originality and force.

The 'Dialogue des Morts,' published in 1683, first laid the foundation of his literary fame, which was firmly established by the appearance two years afterwards of the 'Entretiens sur la Pluralité des Mondes,' one of the ablest of his works, and exhibiting a rare combination of science and wit. The object of the latter was to familiarise his countrymen with the Cartesian astronomy; and in the preface he compares himself to Cicero presenting the philosophy of Greece in a form and language intelligible to the Romans. For the execution of such a task Fontenelle was eminently qualified, and rarely, if ever, has it been so ably accomplished. By the happiness and point of his illustrations, he interests while he instructs his reader: quick to discover in common things unimagined beauties, he adduces and presents new truths in so obvious a light, that even when most opposed to received opinion, they are at once adopted as old and firmly established. In the 'Eloges,' which, as secretary of the Academy, he pronounced upon its deceased members, and by which he is best known to posterity, his peculiar talents are most felicitously displayed. Of a mixed character, between memoirs and criticism, they combine history and encomium with such tact and delicacy, that the panegyric is almost imperceptible, and the commendation the highest when apparently least intended.

The 'Histoire des Oracles,' even if it has no claims to originality, being taken entirely from the learned work of Van Dale, is deservedly celebrated for clearness and precision in the style, which is an exact and distinct image of the thought, and for the regular march of the reasoning, which is so natural and so easy as to present no difficulty to the understanding, and to need no divining. It scarcely deserves however the high title of history. It comprises two essays, in one of which the object is to show that the oracles were not given by the supernatural agency of demons; the other, that they did not cease with the appearance of Christ. Lastly, the 'Géométrie de l'Infini,'

the 'Apologie des Tourbillons,' and similar works, although they display a philosophical spirit, are neither vigorous nor profound.

Generally indeed we ought not perhaps to look to the works of Fontenelle to discover the secret of the great influence and reputation which he enjoyed in his lifetime. The solution lies rather in his possession of unequalled social qualities, and of the most brilliant acquirements, by which he was able to enact at once the man of fashion and the man of letters. By his wonderful skill in adapting himself to the capacity of others, he was able to improve and embellish the lightest conversation with scientific and moral allusions; and by applying the language of ordinary life to the most abstruse topics and ideas, he contributed greatly to transfer the tribunal of letters from the scholarly few to a large and miscellaneous class of readers, and, by this revolution, to favour and advance a spirit of scientific research in the 17th century. Such services may be forgotten, for the names of those who have laboured not so much to discover new truth, as to preserve and transmit the old, are too often left unrecorded; but they have not laboured in vain, for to diffuse truth is as useful as to discover it. If the mission of the discoverer be more dazzling in its course, and its track more permanent, that of the disseminator is not less beneficial to mankind, and leaves, in a more extended civilisation, a nameless but imperishable monument.

The works of Fontenelle were collected and published in 8 vols. 8vo, Paris, 1760.

FOOTE, SAMUEL, was born at Truro, in the county of Cornwall, in 1720. His father was a joint commissioner in the Prize Office, and member of parliament for Tiverton. Samuel Foote was educated at Worcester College, Oxford. On quitting the university, which he did on account of some extravagance of conduct before the usual time, he commenced the study of the law, but this his volatile disposition prevented him from pursuing. About the same time it is commonly said that he married a lady of good fortune, and that the marriage turned out unhappily; but the fact of the marriage has been doubted, and in truth all this part of his life is involved in obscurity. It is certain however that he plunged into all the vices of the town, particularly gaming. His fortune being speedily exhausted, he turned player from necessity, and made his first appearance in the character of Othello, in which he produced no great sensation, if he did not wholly fail. Though he was more successful in comedy, he did not much distinguish himself as an actor till he began to perform parts of his own writing. His difficulties increasing, he was only extricated from them by Sir Francis Delaval, who allowed him an annuity for a not very honourable piece of service. Sir Francis was himself of ruined fortune, and had looked forward to a marriage with a rich lady as the means of repairing it. Foote, discovering a wealthy dame who was prepossessed with fortune-tellers, got a friend to personate a conjurer and recommend Sir Francis as a husband. The scheme succeeded, and Foote was rewarded as above mentioned.

In 1747 he opened the little theatre in the Haymarket, and here commenced his career as an author by writing for his own house first a series of satirical entertainments, which never attained to the dignity of print, and then the succession of short pieces by which he is so well known. He did not however obtain a patent till 1766, when, riding out with the Duke of York, he broke his leg by a fall from his horse, and was forced to have it amputated: the patent was procured by the duke as a sort of compensation for this accident. Foote did not retire from the stage on account of the loss of his limb, but acted with a cork leg. His death is said to have been accelerated by the shock he received on a servant preferring against him a charge of the worst nature: he was tried and honourably acquitted, but seems never to have recovered his spirits. Feeling his health decline, he let his house to Mr. Colman, still occasionally appearing as an actor. While performing one of his characters he was seized with paralysis on the stage. He went to Brighton for his health, and on his return to London he set out for Paris, but died on his way, at Dover, on the 21st of October, 1777.

Complete editions of Foote's works are easily procured; but scarcely a single piece is now produced on the stage. In fact, notwithstanding their great merit, they refer so much to the humours and often to the persons of his own times, that they now possess rather an historical than a dramatic interest; and they will be read by few except those who are desirous of having a view of the striking characters in the latter part of the last century. The Methodists are lashed in 'The Minor;' the passion for travelling in 'The Englishman returned from Paris;' the newspapers in 'The Bankrupt;' the debating societies in 'The Orators;' the bar in 'The Lame Lover;' and in general every piece has its peculiar object of satire. In making his characters stand prominently forth, Foote is not excelled; but, like most depictees of humour, he occasionally falls into the error of giving abstractions rather than probable persons. The pieces which kept the stage longest are 'The Mayor of Garratt' and 'The Liar,' the humour of which is not so exclusively adapted to a particular time. Probably his works give but a feeble notion of his colloquial wit, which was admitted by his contemporaries to be almost unrivalled. His conversational talents, aptness of repartee, and powers of mimicry and punning, being backed by perfect self-possession and entire absence of regard for the feelings of any one he fancied might be rendered ridiculous, gave him in society and on the stage a degree of advantage of which

he was not slow to avail himself, and rendered him one of the most dreaded as well as most amusing jesters that have appeared in this country. The reader who may wish to see an ample and cordial appreciation of his merits, is referred to a long and elaborate notice of him by Mr. Forster in the 'Quarterly Review' for 1854, No. cxc.

FORBES, DUNCAN, was the second son of Duncan Forbes of Culloden, near Inverness, where, or at another seat of the family, called Buncrev, in the same neighbourhood, he was born 10th of November 1685. After studying law for some years at Leyden, he returned to Scotland in 1707, and was admitted an advocate 26th of July 1709. At the bar he rapidly gained employment and distinction. For his first public appointment however, that of sheriff of Mid-Lothian, he was chiefly indebted to the friendship of the Argyll family. The rebellion of 1715 gave him an opportunity of displaying his zeal and activity in support of government; and to his influence and exertions, and those of his elder brother, who had now succeeded to the family estate, the maintenance of the public tranquillity throughout a great part of the north of Scotland at this crisis is considered to have been mainly owing. His services were rewarded the following year by his appointment to what was then called the office of deputy lord-advocate, which was similar to that of the present solicitor-general. In this office he did himself as much honour by the high-minded delicacy which he showed in conducting the trials of the persons charged with participation in the recent treason, as by the ability and courage he had displayed during the insurrection. He even set on foot a subscription to supply his misguided countrymen, who now crowded the jails of England, with the means of making a legal defence. The cry indeed that he was himself a disguised Jacobite was raised by the seals of the government. In 1722 he was returned to parliament for the Inverness burghs, for which his elder brother had previously sat. In the House of Commons, of which he continued a member for the next fifteen years, he of course generally supported the minister, Sir Robert Walpole, as his official situation implied. In 1725 he was appointed lord-advocate, the place of secretary of state for Scotland being at the same time abolished, and its duties devolved upon him. In 1737 he was elevated to the dignity of lord-president of the court of session, or head of the civil judicature of his native country. A few years before this time the death of his brother had made him proprietor of the family estate. For the last twenty years of his life, Forbes was regarded as a sort of lieutenant-governor of Scotland; but besides the power which he exercised through his official connection, he secured to himself a still wider influence by his public spirit, and his unwearied exertions in promoting the welfare of the country in its trade, its manufactures, its agriculture, its fisheries, its roads, and every other department in which any project of improvement suggested itself to his active and patriotic mind. The most memorable public exertions of President Forbes however, were called forth by the rebellion of 1745. In this emergency he certainly contributed more than any other man to keep the rebels in check until the government was enabled to meet them in the field with an adequate military force. Yet not only were his services never rewarded, but he was even refused any compensation for his actual losses and the expenditure of his private resources in the public cause; and his earnest pleas for a compassionate treatment of the rebels after Culloden were, it is said, met by Cumberland with brutal sneers. He had been attacked in his castle of Culloden by the rebels, who probably would have taken his life if he had fallen into their hands. The treatment he met with from the government on this occasion is said to have shortened his days. His death took place on the 10th of December 1747. He left an only son, by a lady whom he married soon after his admission to the bar, but whom he lost after a few years. President Forbes was a man both of extensive scholarship and of elegant accomplishments. Among other branches of learning he had cultivated an acquaintance with the Oriental tongues. He is the author of the following pieces, which were published at Edinburgh in two volumes 8vo, soon after his death:—1, 'Thoughts on Religion, Natural and Revealed;' 2, 'Reflections on the Sources of Incredulity in regard to Religion;' 3, 'A Letter to a Bishop concerning some important discoveries in Philosophy and Religion.' To President Forbes are also attributed the well-known verses beginning—

"Ah! Chloris, could I now but sit
As unconcerned as when
Your infant beauty could begot
Nor happiness nor pain," &c.

His correspondence in relation to Scottish affairs, and especially to the rebellions of 1715 and 1745, was published in a quarto volume at London in 1815, under the title of 'Culloden Papers, &c., from the originals in the possession of Duncan George Forbes of Culloden, Esq.'

(See the *Memoir* prefixed to this publication; *Introduction to Culloden Papers*; *Quarterly Review*, No. xxviii. p. 320, &c. (by Scott); *Mahon, Hist. of Eng.*, chap. xxvii. and xxix.)

FORBES, EDWARD, a celebrated naturalist. He was born in 1815 in the Isle of Man, where his father was a banker. Without any one to direct his taste, he became a naturalist while yet a child. Nothing delighted him so much as to pick up the products of the shore of his native island, when as yet he could hardly read. By the time he was seven years of age he had collected a small museum. His first efforts at naming these objects were made through Turton's

'Translation of the *Systema Naturae* of Linnaeus.' Whilst yet a boy of twelve years old he had read Buckland's '*Reliquiae Diluvianae*,' Parkinson's '*Organic Remains*,' and Conybeare's '*Geology of England*.' Such was the impression produced on his mind by the perusal of these works, that he ever afterwards attributed his taste for geological research to reading them. His first attempt at original work was the production of a '*Manual of British Natural History*,' which, although it was never published, was the repository of many of his notes even to the close of his life. His habit of drawing the natural history objects which interested him, led him to think of painting as a profession, and with this object in view he studied for some time in the studio of the late Mr. Sass in Charlotte-street, London. This profession did not however comply with his restless desire to study the facts of natural history, and in 1832 he repaired to the University of Edinburgh with the object of studying medicine. Here under the teaching of Professors Jameson and Graham he first became acquainted with the true principles of natural science, and the views and objects of its cultivation. This fired his ambition to become himself an observer and add to the already accumulated stores of natural history facts. It was with this feeling that he started with a fellow-student on an excursion into Norway, where he made numerous observations on the rocks, plants, and *Mollusca* of the country, and afterwards published the result of his observations in a paper in the '*Magazine of Natural History*,' entitled '*Notes of a Natural History Tour in Norway*.'

At this early period of his natural history career he had recognised the importance of the dredge as an instrument of his research, and in his hands this simple instrument became as powerful a means of research as the telescope to the astronomer. With it he swept the bottom of the ocean, measured its depths by the character of its inhabitants, and discovered a law for the distribution of marine plants and animals in depth, as strict as the law which regulated their distribution on the altitude of mountains. His early papers, entitled '*Records of the Results of Dredging*,' were published in the eighth and ninth volumes of the '*Magazine of Natural History*.' Much of his student time was spent upon the sea in the neighbourhood of Edinburgh, and scarcely ever did he make a dredging excursion, so new was the operation to the naturalist, without adding some new form or species to his increasing collection of natural objects. His attention was not at all however exclusively confined to marine zoology. Plants were always favourite objects, and no student enjoyed more or profited more largely by the botanical excursions of the late Professor Graham. This habit of excursionising he held constituted a most important element in botanical study, at once invigorating the body, and giving the student a knowledge of the relation of plants to other objects which they could not otherwise obtain. Whilst he held the chair of botany at King's College, London, he never neglected periodical excursions with his students. He was mainly instrumental in 1836 in establishing the Botanical Society of Edinburgh, of which he became the foreign secretary. In 1837 he visited Paris, attended the lectures of the professors there, and worked in the museum and collections in the *Jardin des Plantes*. In the same year he visited Algiers and the coasts of the Mediterranean. In 1838 he published an account of the '*Mollusca of the Isle of Man*,' and in 1839 papers on the '*Land and Freshwater Mollusca of Algiers*,' and on the '*Distribution of the Pulmonifera of Europe*.' In these researches he was laying the foundation for the enlarged views, which he afterwards put forth, with regard to the distribution of the genera and species of animals and plants in time and space.

His papers from this time became very numerous. The materials he accumulated in his various excursions were truly astonishing, and he lived to publish but a comparatively small proportion of them.

In 1841 he published a '*History of British Star-Fishes*,' containing accounts of several new species, with charming descriptions of the habits of these animals, and incidents connected with catching them, whilst the tail-pieces from his own pencil were worthy a disciple of Bewick. In this year he accepted the appointment of naturalist to H. M. S. *Beacon*, commander Captain Graves, who was commissioned to bring the marbles from Lycia, discovered by Sir Charles Fellows. Here new fields were opened up to him. For the first time the resources of a ship of war were placed at the disposal of a naturalist. The result of this voyage was the discovery of the great law, that among marine animals zones of depth corresponded to parallels of latitude. This law was announced at the meeting of the British Association held at Cork in 1843. The detailed results of this voyage were never given to the world, and Forbes always looked forward to the day when a little leisure would permit him to publish in detail his researches. But he had to work for his daily bread, and, to the disgrace of his country, no position was provided for him in which the necessary leisure could be found, till it was too late.

Other results came out of his Lycian excursions. In conjunction with Lieutenant, now Captain, Spratt, he published his travels in Lycia, with numerous illustrations made from his own drawings, and notes on the natural history of the *Ægean*.

It was in Lycia that he contracted the same form of remittent fever which killed one of his companions, the Rev. Mr. Daniell, and from the effects of which he suffered to the day of his death.

Whilst away in the *Ægean*, he was appointed to the Professorship

of Botany in King's College, London, vacated by the death of Mr. David Don. Although he had resolved on a visit to Egypt and a dredging excursion to the Red Sea, the offer of a chair in London was too much in accordance with his tastes to refuse. He now deliberately gave up the medical profession, and became a naturalist for the rest of his life. He gave his first lecture in May 1844, and in the same year he was appointed assistant secretary to the Zoological Society. Both situations contributed to the development of his genius, for whilst the professorship compelled him to arrange and systematise his knowledge, and developed his power of communicating its results, the secretaryship afforded him a means of extending his acquaintance with fossils, and the relations of extinct with recent forms of both animals and plants. These offices however preceded one more important still, that of palaeontologist to the Geological Society of Great Britain. When the Museum of Economic Geology was removed to Jermyn-street, and the School of Mines founded, he was appointed professor of natural history. Although prevented by these appointments from publishing all he had already stored up, he added here fresh stores to his stock of knowledge, and numerous memoirs and papers in the *Natural History Journals*, the *Proceedings of the Zoological Society*, and the *Transactions of the Geological Society*, attest his great observing powers and unwearied industry. One of the most important of these papers is entitled '*On the connection between the distribution of the existing Fauna and Flora of the British Isles, and the geological changes which have affected their area*.' This paper attempts to explain the distribution of the plants and animals of the British Islands, on the hypothesis that they were all diffused from a common centre, and that consequently they must have been disseminated when these islands were continuous with those countries where the identical species are found. He then brings forward geological evidence to support his assertions, and even goes so far as to point out the fact, that at one time and that recently, dry ground existed between the south-western portions of the British Islands and America.

In 1854 Professor Forbes was elected president of the Geological Society. In the same year he accepted the chair of Natural History in the University of Edinburgh. He was president of the geological section of the British Association which met at Liverpool in September. He died on the 18th of November in the same year. The Edinburgh chair was the object of his highest ambition. The increasing years of Professor Jameson rendered it not improbable even when he was a student that he might one day hope to fill this honourable post. He commenced the duties of his new position with his usual ardour, laid down a course of action which would have required years of development, but he had barely time to deliver a preliminary summer course before he was seized with a disease of the kidneys which proved fatal in a few days.

Besides the works to which reference is made above, he was the associate of Mr. Hanley in a great work on the '*History of British Mollusca*,' which was published in parts, and completed in 1853. This work is one of the most complete and exhaustive on the subject of our native Mollusca, and all the descriptions were written by Forbes. He contributed several valuable papers and maps on the distribution of animals and plants to the last edition of Johnston's '*Physical Atlas*.' He also indulged in general literature, and the world was somewhat surprised after his decease to find that for some years he had been a contributor to the review department of the '*Literary Gazette*.' His papers were collected together by the editor, and published under the title of '*Literary Papers by the late Edward Forbes*.' The third volume of the '*Bibliographia Geologia et Zoologia*' of Agassiz and Strickland, published by the Ray Society in 1850, contains a list of eighty-nine papers and works supplied by the author himself, and arranged in chronological order. His contributions to natural history science were perhaps more numerous during the last four years of his life than during any former period of the same length. Few men have laboured more assiduously in the path of natural science, or produced a greater impression on the current thought of those who cultivated the same branches of knowledge, as himself; and the time has not yet arrived when a clear estimate can be made of the influence he has exerted upon the time in which he lived.

FORBES, JAMES, was born in London in 1749. He went out in 1765 with a writer's appointment, in the service of the East India Company, to Bombay; accompanied in a civil capacity the troops sent to assist Ragonath Row, peshwa of the Mahrattas, in 1775; and, after a short visit to England for his health, received an appointment at Baroque, in Guzerat, from which he was promoted in 1780 to be collector and chief resident of the town and district of Dhuboy in the same province, then newly occupied by the company. On the cession of that province to the Mahrattas in 1783, he returned to England, honoured by the affection and sincere regret of the natives who had been placed under his charge. Being in France in 1803, he was among the numerous '*détenus*' confined at Verdun, but was released with his family in 1804 as a man of science by the mediation of the French Institute, at the instance of our Royal Society. In 1806 Mr. Forbes published two volumes of letters, descriptive of his tour in Holland, Belgium, and France, with a more particular account of Verdun, and the treatment of the British detained there. In 1813 he published the work by which he is now best known, '*Oriental Memoirs*, selected and abridged from a series of Familiar Letters, written during

Seventeen Years' residence in India,' &c., 4 vols. 4to, 1813. This work includes observations on those parts of Africa and America at which the author touched in his several voyages. The beauty of its decorations, more especially the coloured plates of animals and plants, from drawings made by the author, which have been rarely surpassed in spirit and beauty, obtained for it uncommon popularity. The text also, though bulky, was calculated to interest the public at large, as containing, intermixed with personal anecdote, an amusing mass of miscellaneous information concerning the Company's service, the history, manners, zoology, and antiquities of Hindustan, especially Guzerat, and other provinces on the western coast. Mr. Forbes died August 1, 1819. He was a Fellow of the Royal and Antiquarian societies, and the Arcadian Society of Rome.

* FORBES, SIR JOHN, M.D., an eminent living physician. He was born in Scotland, and graduated at Edinburgh in the year 1817. He first settled as a physician at Penzance, and afterwards at Chichester, but subsequently came to London, where he now resides. His name was first brought before the profession by his translations of the works of Avenbrugger and Laennec on Auscultation and the Use of the Stethoscope. He was one of the first amongst English medical men to recognise the importance and value of physical diagnosis as a means of detecting diseases of the heart and lungs. His translation of Laennec has gone through five editions, and is still widely read. In the year 1828 he published a work entitled 'Observations on the Climate of Penzance and Lands End.' He was one of the founders of the Provincial Medical and Surgical Association, now the British Medical Association. One of the objects of this association was to obtain information with regard to the medical topography of England. In the first and second volumes of the Transactions of this association Sir John contributed an able memoir on the 'Medical Topography of the Hundred of Penwith.' In this paper a large amount of local information with regard to the diseases of the district mentioned, and their relation to the soil and other physical conditions of the country were investigated. It is to be regretted that inquiries of this kind have not been more generally made, and that so good an object of the British Medical Association has not been more perfectly accomplished. In conjunction with Dr. Conolly, Sir John Forbes was the editor of the 'Cyclopædia of Practical Medicine.' This work consisted of a series of valuable articles on diseases alphabetically arranged. He contributed several of these articles himself. He was also the editor of the 'British and Foreign Medical Review,' till its union with the 'Medico-Chirurgical Review,' since when it has been called the 'British and Foreign Medico-Chirurgical Review.' In his capacity of editor of this journal Sir John displayed unwearied assiduity in the introduction of articles written by men of first-rate ability, and also a public spirit and independence which has deservedly placed him amongst the benefactors of his profession. His independence however, valuable as it has been to the cultivation of habits of sound thought, and the spread of a spirit of searching inquiry into the principles and practice of medicine, was not rewarded by pecuniary success, and he relinquished the 'British and Foreign Medical Quarterly,' a loser in the noble cause of the literature and science of his profession. He has not however been a loser in reputation. On coming to London he was appointed Physician in Ordinary to Her Majesty's household, and Physician Extraordinary to his Royal Highness Prince Albert. He was early elected a Fellow of the Royal Society, and the University of Oxford has honoured itself by conferring on him the degree of Doctor of Laws. Within the last few years he has relinquished the active duties of his profession, and his love of literature has displayed itself in the production of several works of a lighter and more popular kind than his medical writings. In 1849 he published a 'Physician's Holiday, or a Month in Switzerland.' This work is one of the most interesting accounts published of the well-known localities of a tour in Switzerland. In 1852 he published an account of a tour made in Ireland under the title 'Memoranda made in Ireland in the Autumn of 1852;' and in 1856 the notice of another tour under the title of 'Sight-seeing in Germany and the Tyrol, in the Autumn of 1855.' Sir John has ever identified himself with popular progress and the cause of education. He was an active and valuable member of the Committee of the Society for the Diffusion of Useful Knowledge. In 1853 he gave a lecture to one of the literary institutions of Chichester, entitled 'Of Happiness in its relations to Work and Knowledge.' Few men could speak more competently on this subject.

FORBES, JOHN, a divine and polemical writer, second son of Patrick Forbes, bishop of Aberdeen, was born on the 2nd of May 1593. He studied at Heidelberg and Sedan, and returned to Scotland in 1619. In that year he was appointed professor of divinity in King's College, Aberdeen, an office in which he acquired a high character for learning and ability. He lived during the period of the hottest struggles for supremacy between episcopacy and Presbyterianism; and possessed with the views of toleration and ecclesiastical peace that appear to have distinguished his family, he published in 1629, at Aberdeen, 'Irenicum Amatoribus Veritatis et Pacis in Ecclesia Scotiana.' Afterwards, in 1638, when the breach between the two parties, which was the commencement of the civil wars, had begun, he published 'A peaceable Warning to the subjects in Scotland.' He was afterwards a leader in a polemical dispute as one of those

generally styled "the Aberdeen doctors," who conducted, on the side of Episcopacy, a controversy with the Covenanters. Like his coadjutors, Forbes was deprived of his benefice in 1640. His case was one of peculiar hardship, for he had made over part of his own private property to be attached to the professorship which he held; and he lost this property on being dismissed from his office. In 1644 he went to Holland, where he married a Dutch woman named Soete Roosboom, or Sweet Roostree. He returned to Aberdeen in 1646, and died on the 29th of April 1648. Besides the works already mentioned, he published others on kindred subjects, some of which passed through more than one separate edition; and the whole, along with some posthumous additions, were collectively published in his 'Opera Omnia,' at Amsterdam, 2 vols. folio, 1702-3.

FORBES, PATRICK, Bishop of Aberdeen, was born soon after the middle of the 16th century. He was the eldest son of the proprietor of Corse, in the county of Aberdeen, where his descendants still possess estates. He studied at Stirling and Glasgow. His first clerical appointment was at Keith in Morayshire. He became Bishop of Aberdeen in 1618, and died in 1635. He was the author of several polemical works, which were collectively published in Latin at Amsterdam, in 1646. A curious collection of funeral sermons on his memory, by many eminent survivors, was published soon after his death. (Irving, *Lives of Scottish Writers*, ii.; *Funerals of Bishop Forbes*; reprinted for the Spottiswoode Society.)

FORBES, WILLIAM, Bishop of Edinburgh, was born at Aberdeen in 1580. He studied at Marischal College in Aberdeen, which he entered when he was twelve years old. He held for some time a chair of logic in Aberdeen; and afterwards travelled in Germany and Poland, studying at Helmstädt and Heidelberg. On his return to Britain he was offered a professorship of Hebrew in Oxford, but the state of his health induced him to return to his native country. In 1618 he was made principal of Marischal College. We find him in 1621 ceasing to hold this office, and soon afterwards becoming one of the ministers of Edinburgh. In that capacity he preached before Charles I. on his visit to Scotland in 1633, and the eloquence he then exhibited is said to have induced the king to resolve that he should be the first bishop of Edinburgh. That short-lived see was erected in the ensuing year, and Forbes was appointed bishop on the 26th of January 1634. He died on the 11th of April of the same year. His fame is chiefly traditional. His only published work is posthumous: 'Considerationes modestæ et pacificæ Controversiarum de Justificatione, Purgatorio, Invocatione Sanctorum et Christo Mediatore, Eucharistia,' published in 1638. It embodied a proposal for an accommodation between the Protestant Episcopal churches and the Church of Rome, the only result of which could be to have made episcopacy regarded with more suspicion in Scotland than it was. Some other polemical works which had raised high expectations were lost. Burnet, characterising his eloquence, says that "he preached with a zeal and vehemence that made him forget all the measures of time—two or three hours was no extraordinary thing for him."

FORBIN, CLAUDE, one of the most distinguished naval officers that France has ever produced, was born in Provence in 1656, and died in 1734. It is unnecessary to enumerate his various exploits against the English, Dutch, Venetians, and the Barbary powers, but we cannot omit a remarkable circumstance in his life, of which he has left an account in his memoirs. We allude to the attempt which was made in the 17th century to introduce European civilisation into the kingdom of Siam. It originated with an adventurer, a native of the Ionian Islands, called Constance Faulcon, who came at an early age to England, and entered the service of the East India Company. After many vicissitudes he reached Siam, and entering the service of the king of that country, he succeeded in gaining the favour not only of the prime minister but even of the king himself, who on the death of the minister wished to appoint Constance in his place. He had the good sense however to decline the title, in order to avoid exciting the jealousy of the natives, and contented himself with the exercise of the power. The beginning of Constance's administration was successful, and notwithstanding many difficulties, the country began to improve under the administration of this able foreigner. He now conceived the plan of introducing, with the assistance of the Jesuits, the Christian religion, not only into Siam, but also into the adjacent countries, and with that view he persuaded the king of Siam to send three deputies to Louis XIV. The three deputies died on their way, but Louis having heard of the circumstance sent the Chevalier Chaumont, accompanied by Forbin, to the Siamese monarch. The embassy was accompanied by some troops. It concluded a treaty of commerce, secured protection to the Catholic religion in Siam, and returned to France with an embassy from the king. Constance having prevailed on his master to take some French officers and troops into his service, Forbin was appointed grand admiral of the fleet, general-in-chief of Siam, and governor of Bangkok. The French troops were stationed in several parts of the kingdom; they occupied the fortresses of Mergui and Bangkok, and the king requested Louis XIV., by the Jesuit Tachard, to increase their number. Everything seemed now favourable to the progress of European civilisation in Siam, or rather perhaps of the views of Louis XIV. and his advisers, whatever those views were, when jealousy between Constance and

the commander of the French troops destroyed all these brilliant prospects. A Siamese grandee called Pitracha, taking advantage of the quarrels which divided the Europeans, united all their enemies and revolted against the king, took him prisoner, and declared himself regent of the kingdom. He compelled the French to quit the country, and put Constance as well as many other Christians to death. Forbin returned to Europe after a two years' residence in Siam, of which he seems to have been heartily tired. Forbin's memoirs were published, during his lifetime, in 1730, at Amsterdam, 2 vols. in 12mo. They are written with great ease, and his lively descriptions as well as the variety of events related, make them exceedingly interesting. The last years of his life were spent in retirement and devoted to religious exercises and works of charity.

FORD, JOHN, the dramatist, descended from a highly respectable family in the north-west of Devonshire, was the second son of Thomas Ford of Ilington in that county. The exact date of his birth is not known, but Malone's industry has fixed his baptism at April 17, 1586, as appears from the parish register of Ilington.

His family having some connection with Popham, the chief justice, Ford was designed for the bar, and entered at the Middle Temple, November 16, 1602; four years after which time he produced his first poem, 'Fame's Memorial,' an elegy on the death of the Earl of Devonshire, dedicated to his countess, the beautiful sister of the favourite Earl of Essex. This poem adds nothing to the author's present reputation, and all we gather from it are some hints of a disappointment in love, for the cure of which he had recourse to writing. In addition to this mode of mental relief, he applied himself to a practice then common, that of assisting in the composition of plays, but he did not appear as an independent writer till 1629, when he published 'The Lover's Melancholy,' which was followed four years afterwards by 'Tis Pity She's a Whore,' 'The Broken Heart,' and 'Love's Sacrifice.' The next year produced 'Perkin Warbeck;' and in 1638-39 he published two serious comedies, called 'The Fancies Chaste and Noble,' and 'The Lady's Trial.' Besides these, he wrote in conjunction with Decker 'The Sun's Darling,' a moral mask, which was not printed till 1657 according to Langbaine, or 1658 according to Gifford.

Nothing more is known of Ford; but from some obscure traditions it has been supposed that soon after 1638 he retired to his native place of Ilington, and there spent the remainder of his days.

Ford's plays contain many fine thoughts, and numerous specimens of harmonious versification, apparently the result of considerable labour. One fault into which he has fallen in common with others of his contemporaries, that namely of killing off all his *dramatis personæ* at the end of the fifth act, appears to arise from an overstrained desire of completing and perfecting the action of the play. Forgetting that the end of every drama is to represent a certain crisis in the affairs of one or more of the principal agents, he endeavours to make the fortunes of almost all the inferiors converge to the same point, and accordingly involves them in a similar ruin. Ford's great strength lies in his love scenes and the passages of deep pathos; in his comic characters there is nothing of nature or even of genial humour. His best work is, we think, 'Perkin Warbeck.' It has an air of repose throughout which we do not see in Ford's other plays; but if the characters of Annabella and Giovanni had been more fully sustained throughout, 'Tis Pity She's a Whore' would probably have been Ford's most perfect tragedy.

* FORD, RICHARD, descended from an ancient Sussex family, is the eldest son of Sir Richard Ford, member of parliament in 1789 for East Grinstead, and chief police magistrate of London. Mr. Ford's mother, the representative of the Salweys of Shropshire, was the heiress of her father Benjamin Booth, an eminent patron of art, and especially of Richard Wilson, of whose paintings he possessed and left more than sixty. Mr. Ford was born in Sloane-street in 1796, was educated at Winchester, and having graduated at Trinity College, Oxford, was called to the bar in Lincoln's Inn, but did not practise. He travelled much on the continent, then just opened by the downfall of Napoleon I., and laid the foundation of his choice library and collection of drawings and engravings. In 1830 he went to Spain, where a long residence in the Alhambra, and a complete examination of the country, fixed his future studies. On his return he settled in Devonshire, and busied himself in laying out Moorish gardens, and in contributing regularly to the 'Quarterly Review,' chiefly selecting for subjects those that bore on the manners, arts, and literature of the Peninsula. He also wrote the account of Velasquez in the 'Penny Cyclopædia.' He finally embodied his Spanish experience in his 'Hand-Book for Travellers in Spain and Readers at Home, describing the Country, and Cities, the Natives and their Manners; the Antiquities, Religion, Legends, Fine Arts, Literature, Sports, and Gastronomy; with Notices on Spanish History,' 2 vols. 12mo. The pages being continuous through both volumes, the 1st is named Part I. and the 2nd Part II. Mr. Ford's 'Hand-Book' corresponds in fact with the above descriptive title-page. Its value is very great, not only to the tourist in Spain, but to all at home who seek information concerning that country, previously so ill-described and consequently so imperfectly known. As a work of reference it is very valuable, not only for what is described or related, but for the numerous authorities to which the reader is referred for further information. The plan throughout is excellent. Part I. is preceded by 'Preliminary Remarks,' consisting of such general information as is necessary for the

tourist. Besides these remarks, each division and ancient province of the country is preceded by a copious introduction describing the general features. The traveller is then conducted by a series of 'routes,' or journeys, in various directions, in the course of which the district and the cities, towns, and sometimes villages, which it contains, are carefully and fully described. The notices of works of architecture, of Spanish painters and paintings, of sculptures, carvings, and other works of art, are copious, generally trustworthy, and convey a large amount of information previously unknown in this country. It may be observed however, that the materials of the work, which must have been gathered piecemeal by extensive observation and laborious research, are sometimes put together somewhat confusedly, and are too much mixed up with the author's peculiar opinions, generally piquant enough in point of expression, but not always to be admitted as true. The public demand for a work treating on a country comparatively so little visited, having arisen from its comprehensive, exhaustive, and accurate character, a new edition, almost rewritten, was published in 1855.

Mr. Ford married Harriet, daughter of the late Lord Essex, and of this union three children remain. By his second wife Eliza, sister to Lord Cranston, one daughter remains. His third wife was Mary, sister to the late Sir William Molesworth. Mr. Ford's only brother, James, a prebendary of Exeter Cathedral, is the author of many and learned theological works.

FORDUN, JOHN DE, the father of Scottish history, is believed to have been a canon of Aberdeen, and to have been born in the parish of Fordun, in the Mearns, in the early part of the 14th century. He probably died in the year 1386, or very soon after. His history, as far as completed by himself, is in five books, and comes down to the end of the reign of David I. (1153); it begins at the creation, the first chapter being entitled 'De Mundo sensibili, terra scilicet et suis quatuor punctis principalibus, orientali, occidentali, australi, et boreali,' and a great deal that immediately follows, being rather a treatise on cosmogony than a chronicle or history. But, in addition to the five books, he left materials for bringing down the narrative to 1385, which were put in order by Walter Bower, abbot of Inchcolm, who, as he tells us himself, was born in that year. Bower also continued the history to the death of James I. (1437), the whole work being thus extended to sixteen books. Fordun states that he spent much time in collecting the materials for his history, both by inquiry and by travel; and he appears to have made a diligent use of all the sources of information that were accessible to him. He has undoubtedly preserved many facts which otherwise would have perished. Although by no means free from the credulity which belonged to the spirit of his age, he deserves to be considered as, by comparison, both an honest and a sensible writer; the mythology of the Scottish history appears in a much simpler shape in his account than it assumes in the hands of his successors. The first five books of Fordun's work were first printed under the title of 'Joannis Fordun Scoti Chronicon, sive Scotorum Historia,' in Gale's 'Historiæ Britannicæ, Saxonicæ, &c., Scriptores xv.' (commonly referred to as the first volume of Gale's collection), fol., Oxon, 1691, pp. 563-701. The first complete edition of the work was published by Hearne at Oxford, in 5 vols. 8vo, in 1722, under the title of 'Joannis de Fordun, Scotichronicon.' A more complete and accurate edition appeared at Edinburgh in 1759, in 2 vols. fol., entitled 'Joannis Fordun Scotichronicon, cum supplementis et continuatione Walteri Boweri, Insulæ Sancti Columbæ Abbatis, &c., cura Gualteri Goodall.' Some copies of this publication are said to have a different title-page, with the date 1775. Goodall's introduction is a very poor performance. Many manuscripts of Fordun are extant.

FORLI, MELOZZO DA, a celebrated painter of Forlì, where he was born about 1436. Melozzo was the first who ventured to foreshorten figures upon ceilings, to attempt the 'sotto in su,' as it is termed by the Italians, and in which Correggio has obtained so great a name: Melozzo however was scarcely inferior in this respect to that great painter. He excelled generally in perspective: in a work published in 1494 by Fra Luca Pacioli, entitled 'Summa d'Arithmetica et Geometria,' he is enumerated among the living painters who were "famosi e supremi" in perspective.

Scarcely anything is known of Melozzo, though his contemporaries termed him "the incomparable painter, and the splendour of all Italy." (Morelli, 'Notizia d'Opere di Disegno,' &c., p. 109.) He is supposed by some to have been the fellow-pupil of Mantegna with Squarcione at Padua, and by others to have been the scholar of Piero della Francesca, one of the earliest masters of perspective. He was early in Rome; he is noticed by Vasari as the contemporary of Benozzo: he painted there in 1472 for Cardinal Riario, the nephew of Sixtus IV., an 'Ascension of Christ,' on the altar-vault of a chapel of the church of the apostles, Santi Apostoli, which was sawed out and removed in 1711, the principal part to the Quirinal Palace, and part to the Vatican, which is now in the sacristy of St. Peter's. The part in the Quirinal, the 'Ascension,' has the following inscription:—'Opus Melotti Foroliviensis, qui summos fornices pingendi artem val primus invenit vel illustravit, ex abside veteris templi SS. XII. Apostolorum huc translatum anno Sal. MDCCXI.' All the fragments are engraved in D'Agincourt's 'Histoire de l'Art parles Monumens.' There is also a large fresco, now mounted on canvass, in the gallery of the Vatican, which was formerly on a wall of the old Vatican library; it represents Sixtus IV. installing

(Bartolomeo Sacchi, or) Platina in 1475 as prefect of the said library. The fresco was removed from the wall and fixed to the canvass by Domenico Succi of Imola, by order of Leo XII. The expression of all the heads, mostly portraits of distinguished persons, is good and individual, and the general arrangement and colouring are of great merit, but in the severe style of Mantegna and other eminent quattrocentisti.

(Vasari, *Vite de' Pittori, &c.*, in the life of Benozzo (Gozzoli), and the notes to Schorn's German translation; Lanzi, *Storia Pittorica, &c.*; *Galleria di Quadri al Vaticano*, Roma, 1836.)

FORMOSUS, Bishop of Porto, was raised to the see of Rome in 891, after the death of Stephen V. He had acquired a reputation for learning and piety, but being in opposition to John VIII. in the matter of the election of a new emperor, that pope had deposed him in 878; but Martin II., John's successor, honourably re-instated him in his see. His conduct after his exaltation to the papal see was both firm and moderate, as is shown by his letters relative to the schism of Photius, as well as by those which he wrote to Eudes, the competitor of Charles the Simple, and to the bishops of Gaul, exhorting them not to disturb Charles in the possession of the crown. In one instance however he has been accused of tergiversation. In February 892 he crowned Lambert, son of Guido, as colleague to his father in the kingdom of Italy; but soon after, in consequence of disputes between Guido and the Roman see, Formosus wrote to Arnulph, king of Germany, inviting him to come to Italy and assume the crown. Arnulph came to Italy, and was crowned at Rome by Formosus in the beginning of the year 895, after the death of Guido. The history of that period, and of the various competitors to the crown of Italy, is extremely confused. Formosus died in April 895, and was succeeded by Boniface VI., who, dying a few days after, was succeeded by Stephen VI., by some styled the VII., who, having taken the part of Lambert against Arnulph, instituted proceedings in a council against the memory of Formosus, and had his body disinterred. Romanus however, who succeeded Stephen, in a council held at Rome in 898 rescued the character of Formosus from this stigma, had his body honourably buried again, and declared the acts of his pontificate to be legal and valid.

FORSSELL, CARL AF, a Swedish philanthropist and statistician, was born at Sköttorp, in the province of Skaraborg, on the 18th of March 1783. His father was a colonel in the army, his mother, whose name was De Bruce, was descended from a Scottish family settled in Sweden. At the school of Skara where he received his first education he was frequently flogged, and was remarkably dull; at the military academy of Carlberg, where corporal punishment was prohibited, he gained a succession of prizes. In 1801 he commenced his career as an officer on board the *Bellona* frigate, during the armed neutrality of the northern powers, but he was never fond of the sea, and was soon transferred to the land-service. He was for some time engaged in taking surveys of parts of Sweden for the great map by Baron Hermelin, which was made at Hermelin's expense, and in 1808 with his brother in taking similar surveys for the projected Gotha canal, which was carried into effect by Telford the engineer of the Caledonian Canal, and which, like the Scottish undertaking, was far from successful as a pecuniary speculation. In 1809 on hearing that Adlersparre, the commander of a portion of the army of Finland, was on his march to Stockholm to effect an alteration in the government, Forsell instantly went off to the insurgents and offered his services, which were accepted. General Döbeln, to whom Forsell was sent with some proposals, threatened to have him shot as a rebel, but in a few days the question was decided without a blow. Gustavus IV. was dethroned, and his uncle Charles XIII. succeeded. Forsell was appointed adjutant to the newly-elected crown-prince, Charles Augustus of Augustenburg, and attended him in his expedition to Scania, where the prince's sudden death put an end to the hopes of seeing the three crowns of Scandinavia united on one head. Forsell was also present at the most disgraceful scene in the modern history of Sweden, when Count von Fersen, wrongfully suspected of having poisoned the prince, was torn to pieces at his funeral by the mob of Stockholm. The new crown-prince, Bernadotte, continued Forsell in his post, and he accompanied him during all the war in Germany, having under his charge the maps required for the campaign, which were not less than 5000. After the peace he was raised in 1817 to the order of nobles, and in 1824 became chief of the surveying department with the rank of colonel. A new map of Sweden in eight sheets on a larger scale than Hermelin's was constructed under his superintendence, and Norway, now united to Sweden, was mapped on the same scale by Norwegian officers. A series of statistical tables, originally published in a quarto volume as an accompaniment to the map, was found so useful that it was republished in a separate form under the title of '*Statistik öfver Sverige*,' in 1831, was translated into Danish and German, and ran through several editions, the last of which was issued in 1844. It is the book most frequently referred to by writers on the subject. A volume of notes, '*Anteckningar och Statistiska Uppllysningar öfver Sverige*,' published in 1837, is a companion, and is intended to correct some of the injurious notions of Sweden diffused by Laing. Forsell took an active part in introducing into his native country several of the improvements of modern times, both moral and mechanical. In 1819 he wrote a pamphlet and founded a company for the introduction of steam-boats, and it was a subject of pride that

the first two steamers in Sweden were built in Swedish waters, at Stockholm and Högarna, but one was in Mr. Owen's establishment, and the other at Mr. Stafford's; and the latter was so bad that it occasioned a loss to the shareholders. In 1820 and 1821 he introduced savings banks, in 1830 temperance societies, in 1834 a society in imitation of the English Society for the Diffusion of Useful Knowledge, which published a periodical entitled '*Läsning för Folket*' ('Reading for the People'). In 1834 he visited England for the purpose of studying the management of infant schools. The visit was a very unfortunate one, for it was begun when he was unwell, it was continued in ill-health, and it all but ended fatally in an attack of the cholera at Manchester, where he finally rose from a sick bed without money to carry him home, but was set at ease by his Quaker physician, Dr. Ransome, who told him he would discharge his hotel bill and wait for his own till his patient had arrived at Stockholm. In 1835 he published his '*Notes on the occasion of a Tour to England at the end of the Summer of 1834*,' in which he gives an account of his visit to Mr. Clowes's printing-office, to his old friend Mr. Telford, to his countryman Mr. Ericsson, &c., but the volume on the whole bears signs of the feebleness of the author's health. He supplied an account of education in Sweden to the sixth volume of the London '*Journal of Education*,' and a notice of the provision for the poor in Sweden to the English Poor-Law Commissioners, which was printed in their report laid before parliament. Forsell died at Stockholm on the 25th of October 1843, universally respected as a zealous benefactor of his fellow-citizens. The name is common in Sweden, and the Carl Forsell who in 1833 published a handsome volume of costumes under the title of '*Ett År i Sverige*' ('A Year in Sweden'), is not akin to the statistician.

FORSKAL PETER, a celebrated naturalist and oriental traveller, was born in Sweden, in the year 1736. After studying at Göttingen, where he published a dissertation under the title of '*Dabia de Principiis Philosophiæ recentioris*,' by which he gained some credit, he returned to his native country. In 1759 he wrote his '*Pensées sur la Liberté Civile*,' a pamphlet which did not prove agreeable to the ruling powers of Sweden. A fondness for natural history had brought him acquainted with Linnæus, then at the zenith of his fame, by whom he was favourably recommended to Frederick V., king of Denmark. In 1761 he obtained the title of professor at Copenhagen, and having been distinguished for his acquaintance with oriental languages, he was selected to join Niebuhr and others in an expedition to investigate Egypt and Arabia. After visiting Marseille, Malta, some of the Greek islands, and Constantinople, he arrived at Alexandria. For about a year he remained stationary in Cairo and its vicinity; he afterwards visited Suez, and entering Arabia by Lohia, he penetrated by way of Beit-el-Fakih and Zebid as far as Mocha; thence crossing the mountains to Tana and Abb, he eventually and with difficulty reached Jerim, where he died on the 11th of July 1768. In the course of this journey, although robbed and ill-treated by thieves near Alexandria and elsewhere, suffering from constitutional timidity, and often bowed down with sickness, he investigated with such extraordinary energy and perseverance the natural productions, especially the plants, of the places he visited, that although he never lived to arrange his papers, the account of the vegetation of Egypt and Arabia, compiled after the return of his companions to Europe, is a model of the manner in which such investigations should be conducted. From his friend and companion Niebuhr, to whom the care of editing Forskal's manuscripts was intrusted, we have a '*Fauna Orientalis*,' under the title of '*Descriptiones Animalium, Avium, Amphibiorum, Piscium, Insectorum, Vermium, quæ in itin. orient. observavit Petrus Forskal*,' 1775, 4to; and in the same year and form appeared a '*Flora Ægyptiaco-Arabica*,' or an account of the plants found in Lower Egypt and Arabia Felix. This latter work is very remarkable as an illustration of the philosophical mind of Forskal, and is far in advance of the works of a similar kind published by the followers of Linnæus. It is one of the first books in which the relation of vegetation to climate is taken as a great object of consideration, and may in fact be quoted as one of the earliest steps made in geographical botany. We here find an attempt to show the existence of geographical parallels of vegetation, and the remarkable assertion that, "Given the specimens of plants, you may find the latitude of a country, the elevation of its surface, and the zones of vegetation upon its mountains, from their foot to their highest peaks." The '*Flora Ægyptiaco-Arabica*' is to this day the best account we have of the plants of those countries, and it remains one of the most satisfactory views of the vegetation of any extra-European region. Linnæus fixed the name of Forskal to his own *Caidbeja adharrens*, a worthless Arabian weed, under the title of *F. tenacissima*; but we are assured by a panegyrist of the great Swedish botanist, that in doing so he intended to compliment rather than satirise the character of his unfortunate countryman.

FORSTER, FRANK, civil engineer, was born in the year 1800, near Newcastle-upon-Tyne, and at an early age was put to learn the business of a colliery viewer, or mining agent. After some years, he was intrusted with the management of mining works near Swansea; and he was afterwards similarly engaged in Lancashire. Whilst thus occupied, about the year 1830, he became acquainted with Mr. Robert Stephenson, under whom he was ultimately employed in the superintendence of some of the most difficult works on the London

and Birmingham railway, inclusive of the Kilsby Tunnel and the Blisworth Cutting, and somewhat later he was resident engineer of the portion of the Chester and Holyhead railway, from near Conway to Holyhead, including the masonry of the Britannia Bridge, and difficult works in sea-walls and tunnels along the line. On the formation of the Metropolitan Commission of Sewers, Mr. Forster was appointed chief engineer, and was instructed to furnish a general scheme of London sewerage, for which many plans had been sent in to an invitation some time previously. He very soon suffered from the effects of the arduous duties thrown upon him, and which were rendered more difficult by numerous contending opinions and interests. He himself was freely animadverted upon by the press, and he was at length compelled to resign his appointment, and died suddenly a few weeks afterwards, on the 13th April 1852, in his fifty-second year. His reports and plans with reference to the drainage of the north of London remain, and are understood to have formed the basis of the schemes now under consideration, and in which a partial commencement of work has been made.

FORSTER, GEORGE, a civil officer in the service of the East India Company, is chiefly known by his journey in 1782 over-land from India to Russia. He set off from Lucknow in December 1782, and directed his route to the north by Ferozabad, Rampoor, and by the pass of Lall Dong into the upper regions of the Punjab, avoiding the country of Lahore, which was possessed by the Sikhs or Sikhs. He then proceeded by Bellaspore and Jompo into the great alpine valley of Cashmere, which had not been visited by any European traveller before him, Bernier excepted. Forster's account however proved much more full and satisfactory than that of Bernier. Quitting Cashmere, Forster proceeded to Cabul, crossing the Indus about twenty miles above Attock. From Cabul he followed the caravan road to Candahar, and thence by Herat to the southern coast of the Caspian Sea. From Oude to the Caspian he was nearly twelve months on his journey, the distance being 2700 miles, amidst all sorts of dangers and privations, which were much greater at that time than they would be at present. He embarked at last at Meshed Ser on the Caspian, and sailed from thence to Baku and Astrakhan, from which last place he travelled to Moscow and Petersburg, where he arrived at the end of May 1784. On his arrival in England he published some sketches of Hindoo mythology. He afterwards returned to India, and published in 1790 at Calcutta the first volume of his narrative—'Journey from Bengal to England through the most northern parts of India, Kashmere, Afghanistan, and Persia, and into Russia by the Caspian Sea.' On the commencement of hostilities with Tippoo Sultan, Forster was sent as envoy to the Mahratta court of Nagpore in the Deccan, where he died in 1792. The manuscript of the sequel of his journey was sent to England, where it was published in a second volume, but was edited without much care. The whole work was translated into French by Langlès: 'Voyage de Bengale à Petersburg,' 3 vols. 8vo, Paris, 1802. Forster added to his narrative two interesting notices of the Sikhs and the Rohillas.

FORSTER, JOHN REINHOLD, was born in 1729, at Dirschau in Western Prussia, of which town his father was burgo-master. Having studied at Halle, he was appointed in 1753 to the cure of Vassenhoff near Danzig. In 1765 he accepted an offer to go to Russia to take the direction of the new colony established by Catharine at Saratof; but he soon left it in disappointment, and proceeded to England in 1766, where he became known to Mr. Banks and others for his acquirements in natural history. During his residence in England he employed himself for some years as teacher in the Dissenters' academy at Warrington in Lancashire. Through Mr. Banks's interest he was appointed naturalist to the second expedition under Captain Cook, and he sailed, together with his son George, on board the *Resolution*, in July 1772. A sum of 4000*l.* was granted by parliament for his expenses, besides which it was verbally understood between him and the Honourable Daines Barrington, in the name of Lord Sandwich, that Forster should be employed on his return to write the history of the voyage, and receive the profits of the publication. In the course of the voyage repeated disagreements took place between Forster and the officers of the expedition, and Captain Cook himself appears to have censured Forster's indiscretion and want of temper. After the return of the expedition in July 1774, a controversy arose between Forster and Lord Sandwich about writing the narrative of the voyage. It was at last settled that Forster should write the philosophical, and Cook the nautical parts of the work. Forster's manuscripts were to be subject to Barrington's correction; but on presenting a specimen of his intended work, he was told that he must not write a connected narrative but only detached observations, and ultimately even these were rejected. The consequence was that Cook's journal appeared alone. Meantime Forster, the son, published a separate account of the voyage in 1777; a circumstance which indisposed the admiralty still more towards his father, who was believed to have had the principal share in the work, and who thus lost all hope that he might have entertained of remuneration. Forster's account of the transactions is given in the letters of his son George to Lord Sandwich, and to Mr. Wales, who had written strictures on Forster's narrative. In 1778 Forster returned to Germany, and was well received at Berlin by Frederic the Great, and was soon afterwards made professor of

natural history and mineralogy at Halle, where he remained till his death, in December 1798.

Forster was a man of vast information both in the natural sciences and in philosophy and general literature. His principal works are:—1, 'De Byssu Antiquorum,' 1775; 2, *Characteres Generum Plantarum quas in insulis Maris Australis collegit J. R. Forster*, 4to, 1776; 3, 'Observations faites dans un Voyage autour du Monde, sur la Géographie physique, l'Histoire Naturelle, et la Philosophie Morale,' 4to, 1778. This work was translated into various languages, and forms a good supplement to Cook's journal, although the tone of Forster's observations is not always in accordance with sound criticism. 4, 'Zoologia Indica,' 1781; 5, 'Histoire des Découvertes et Voyages faits dans le Nord,' 1784; 6, 'Tableau de l'Angleterre pour l'année 1780,' a satirical work written under the influence of disappointment and animosity, and consequently with little discrimination.

FORSTER, JOHN GEORGE, born in 1754, son of John R. Forster, accompanied his father in the voyage with Captain Cook, and published an account of the same in 1777, which involved him and his father in an unpleasant controversy. This narrative does not differ materially in the facts from Cook's journal. Forster however has added to his work various observations, which he considered as philosophical, but which are often only declamatory. His book was translated into German, French, Swedish, and other languages. Forster having returned to the continent, was made professor of natural history at Cassel, and afterwards at Wilna, from which last place he returned to Germany about 1788, and was appointed librarian to the elector of Mayence. After the French took Mayence in 1792, Forster, who had become enthusiastic in the cause of the revolution, was chosen by the republicans of that city to proceed to Paris, as their representative, to request the incorporation of Mayence with the French republic. While he was at Paris on this mission, the Prussians re-took Mayence, and Forster lost all his property, including his books and manuscripts. This loss, and other domestic disappointments, made him resolve on leaving Europe, and he planned a journey to India and Tibet, preparatory to which he applied himself to the study of the Oriental languages; but he fell ill soon after, and died in January 1794. He left several works; among others, 'Ansichten von Nieder Rhein, von Brabant, Flanders, Holland, England, und Frankreich in 1790,' in three parts, of which the last was published after his death, Berlin, 1794. This work was translated into French under the title of 'Voyage Philosophique et Pittoresque sur les Rives du Rhin,' &c., 3 vols. 8vo, Paris, 1795-96. The last volume contains an essay on the history of the fine arts in Great Britain. Forster wrote also 'Herbarium Australe,' several memoirs on natural history, and various political and philosophical sketches and pamphlets. Humboldt, in his 'Kosmos,' describes George Forster as of "noble, sensitive, and ever-hopeful spirit," and says that "his smaller works contain the germ of much which, at a later period, has been brought to maturity."

*FORSTER, JOHN, was born at Newcastle in 1812. The University of London, which was founded in 1826, has given to our country many distinguished men whose early education has been built upon broader foundations than that of the classical and mathematical studies of the ancient universities. Mr. Forster was a student in that institution, in association with several others who have since risen to eminence. The first Law Class (of which Mr. Andrew Amos was the teacher) was attended by him, and by Napier and Whiteside, famous at the Irish bar and in the House of Commons, Mr. Craig, Q.C., the late Dr. W. Cooke Taylor, and others, who have distinguished themselves. The members of this class established a 'London University Magazine,' to which all contributed, and a debating society in which all spoke. Out of the 'London University Magazine' grew the 'Englishman's Magazine,' to which, among other things, Mr. Forster contributed a series of biographical papers on the 'Early Patriots of England,' the foundation of his 'Lives of the Statesmen of the Commonwealth.' A diligent law-student, and a pupil of Chitty, Mr. Forster, after keeping the usual terms, was called to the bar. With an ardent devotion to literature, and with habits of friendship with young men then struggling into celebrity as writers, Mr. Forster became a valuable contributor to periodical works; and early in 1834 was connected with the 'Examiner,' of which, from 1846 he has been the sole editor. During all those two-and-twenty years he has, without the intermission of a single week, largely contributed to its pages. In addition, for a period of eleven months, after the retirement of Mr. Dickens, he was editor of the 'Daily News.' Of the general character of the 'Examiner' we have already spoken; and have mentioned Mr. Forster's participation in its management. [FONBLANQUE.] It is difficult to overvalue the influence of a systematic writer and conductor of an important journal. Writing anonymously, but perfectly identified with the character of such a paper, he has constantly to maintain the real consistency of his opinions amidst every change of circumstances; and that he can only do by having broad constitutional principles for his guidance, and a never-ceasing desire for the just amelioration of the social condition of every member of the community. In his vocation of journalist, Mr. Forster has long worked in a wide field of usefulness. But he has done as high service as a critic as in his political function. He has always exhibited a generous appreciation of merit of every degree. Some who are now amongst the most celebrated have received their first encourage-

ment from his commendation; and those who know how flippantly—to say the least of much periodical criticism—unacknowledged ability is sometimes treated, will feel the value of judicious praise and well-considered objection. To sneer, and to “hesitate dislike,” is the office of some censors. Mr. Forster is not of that number. Early in his literary career he became engaged in a work of high pretensions and considerable extent, ‘Lives of the Statesmen of the Commonwealth,’ in seven volumes of the series published as ‘Lardner’s Cyclopædia.’ Exhibiting very extensive research, accurate in its facts, and lucid in its style, this is undoubtedly a remarkable performance for so young a man; and its high merits are beginning to be more justly appreciated than they were popularly at the period of its publication, however they were then estimated by careful readers. A writer in the ‘Quarterly Review’ (June 1856), who dissents from many of Mr. Forster’s opinions in that work, acknowledges that he is “peculiarly exact in his facts, and that his ‘Lives’ contain an immense amount of invaluable information which he was the first to drag into day.” This writer also points out “that there is no other single authority to which M. Guizot refers so often” in his historical works on that period. A revised edition in octavo of these lives is about to be published.

Mr. Forster’s combination of the qualities that belong to the true biographer, and the generous critic have been displayed in his ‘Life and Adventures of Oliver Goldsmith.’ The first edition of this delightful book was published in one volume in 1848. An enlarged edition in two volumes appeared in 1854, the title being changed to the ‘Life and Times of Oliver Goldsmith.’ Recently has been issued an abridged edition of that of 1854, under the same title. This agreeable volume is perhaps better calculated to interest the general reader than the more elaborate work, however interesting its large body of illustrative notes and authorities may be to the careful student of our literary history. Mr. Forster has written some striking articles in the ‘Edinburgh Review,’ and the ‘Quarterly Review,’ among which are those of Defoe and Churchill in the ‘Edinburgh,’ which have been separately republished; and those on Foote, Steele, &c., in the ‘Quarterly.’ In 1856 Mr. Forster was appointed Secretary to the Commissioners in Lunacy—an office for which his legal education especially qualified him.

FOTESCUE, SIR JOHN, KNIGHT, an eminent lawyer, lord chief justice of England in the reign of Henry VI., and afterwards chancellor. The date of his birth is unknown, and of the place it is only conjectured that it was somewhere in Devonshire, to which county his family belonged. He is said by Tanner to have been educated at Oxford. He was a member of Lincoln’s Inn; in 1430 became serjeant-at-law; in 1441 King’s serjeant; and in 1442 chief justice of the King’s Bench. He accompanied Henry VI. into Scotland, and was included in the bill which attainted the king, Queen Margaret, Prince Edward, and their chief adherents of high treason. In 1443 he fled with Queen Margaret to the continent, and remained there in exile till the return of the queen to England. He is believed to have been subsequently permitted to live in England in retirement. The year of his death does not appear to be known. He wrote several works, but his great work is a treatise ‘De Laudibus Legum Angliæ,’ a work which has been several times quoted with the highest approbation from the bench, illustrated by the notes of Selden, and recommended by such writers as St. German and Sir Walter Raleigh, in former times, and by every writer who has since given directions for the study of the law. It has been several times translated into English. It is in the form of a dialogue between himself and the young Prince Edward, with whose education he appears to have been intrusted. The author undertakes to show that the common law was the most reasonable and the most ancient in Europe, and superior to the civil law and the laws of other countries. He considers at length, in particular, the mode of trial by jury; and after examining some other points of difference between the civil and the common law, he concludes with a short account of the societies where the law of England was studied. This book, as well as the other works relating to English law of an early date, is written in a bold style, and displays many sentiments upon liberty and good government which are very remarkably considering the fierce and barbarous period at which they were written. “We cannot,” says Chancellor Kent, “but pause and admire a system of jurisprudence which, in so uncultivated a period of society, contained such singular and invaluable provisions in favour of life, liberty, and property as those to which Fortescue referred. They were unprecedented in all Greek and Roman antiquity, and being preserved in some tolerable degree of freshness and vigour amidst the profound ignorance and licentious spirit of the feudal ages, they justly entitle the common law to a share of that constant and vivid eulogy which the English lawyers have always liberally bestowed upon their municipal institutions.” The English translation of the treatise ‘De Laudibus Legum Angliæ,’ and the original Latin text, together with some notes by Mr. Ames, were published in 1825 at the expense of the University of Cambridge. (Kent, *Commentaries*; Reeve, *History of English Law*.)

FORTIGUERRA, NICOLO, an Italian prelate, whose writings display little of the austerity or seriousness of a churchman, was born at Pistoja, November 7, 1674. In his youth he studied jurisprudence, and afterwards distinguished himself by his attainments in Greek. Having published a funeral discourse in honour of Innocent XII., he

was appointed secretary to the papal nuncio in Spain, and on his return to Rome, in consequence of his ill-health, had a situation as one of his chamberlains bestowed upon him by Clement XI. in 1712, and was likewise made a canon of the church of Santa Maria Maggiore. By another pope (Clement XII.) he expected to be raised to the dignity of cardinal; but although an encourager of both poetry and poets, that pontiff evaded from time to time the fulfilment of the promise which he appears to have made, until Fortiguerra was lying on his death-bed, when he rejected the honour then proffered him in terms the reverse of courtly. Monsignor Fortiguerra’s lyric poetry, in which he showed himself an imitator of Petrarch, is now forgotten; his fame rests entirely upon his ‘Ricciardetto,’ an heroic-comic poem in thirty cantos. This production, which was first published with its author’s name Grecianised into Carteromaco, was begun by him without any plan, merely by way of proving with what facility he could imitate Ariosto, Pulci, and Berni, both in regard to their style and their fertile invention of incidents; when, at the instance of those friends for whom the first canto was hit off as a specimen, he was induced to proceed till he completed the whole, at the rate, we are assured, of a canto per day. Little therefore is it to be wondered at that the plot should be so desultory and the incidents so extravagant. Yet, notwithstanding the grotesqueness of the characters and events, and likewise the occasional carelessness of the style, this long ‘improvisatore’ poem abounds with so much comic humour, droll satire, and happy burlesque, that it has long taken its place as a classical work of its kind, and has gone through numerous editions. There are two French translations of it; and a German one by Gries, the translator of Ariosto and Tasso, was published 1831-33. In English we have a poetical version of the first canto, with an introduction and notes, by the late Lord Glenbervie (1822). ‘Ricciardetto’ was not published till after the author’s death, which happened on the 7th of February 1735, the date of the first edition being 1738. Fortiguerra was probably aware that, however it might contribute to his fame as a poet, it was not likely to advance him in the church, since many of the descriptions are more spiritited than decorous; through much of it there is a seasoning of profanity; and he has been not at all sparing of his satire on the monks.

FORTIS, ABBATE, an Italian, born in 1740, died in 1803, wrote many works on various branches of natural philosophy. His reputation was established, and his memory has been chiefly preserved, by his travels in Dalmatia, ‘Viaggio di Dalmazia.’ These travels have been translated into many languages, but the English translation, published at London in 1778, is not only the best, but even preferable to the original, on account of the appendix, various plates, and several other additions, which appeared for the first time with this translation.

FORTOUL, HIPPOLYTE, late Minister of Public Instruction in France, was born in 1811. He commenced active life as a literary man by contributions to the ‘National,’ ‘L’Artiste,’ and other periodicals. In the earlier part of his career he professed republicanism and St. Simonianism, and was befriended by Béranger the poet, of whom, in 1830, he published a biography. He was a contributor to the ‘Revue de Paris,’ and was an unsuccessful competitor for the editorship of the ‘Revue des Deux Mondes.’ Meantime, by laborious private study, he step by step attained to university honours. He was made Professor of Literature in the university of Toulouse, where he distinguished himself as a lecturer, and was afterwards recompensed for his services by being appointed Dean of the Faculty of Art. He was also admitted into the French Academy in the section of Belles-Lettres. After the revolution of 1848 he was elected a member of the French National Assembly, in which he spoke frequently, and obtained the favour of the Prince President. Immediately after the coup d’état he was appointed, December 3, 1851, Ministre d’Instruction Publique et des Cultes, and was one of the six ministers who signed the decree for the confiscation of the estates of the house of Orleans. He made himself extremely unpopular with the literary classes of France by the decision and energy with which he carried out the imperial system of restriction of the press. He had gone to Ems for the benefit of his health, when he died suddenly as he was conversing with his colleague M. Magne, on the 7th of July 1856. By a decree of the emperor he was buried at the public expense, with the firing of guns, processions, and other honours, on the 12th of July, in the church of St. Thomas d’Acquin, Paris.

FOSBROKE, REV. THOMAS DUDLEY, the only child of Mr. William Fosbroke, whose progenitors for several generations had been clergymen, was born in London 27th May 1770. He was educated at St. Paul’s School, whence he was elected in 1785, to a Teasdale scholarship at Pembroke College, Oxford. He took his degree of M.A. in 1792; and the same year obtained the curacy of Horsley, in Gloucestershire, which he held till 1810, when he became curate at Walford in Herefordshire. He was presented to the vicarage of Walford in 1830, and he died there on the 1st of January 1842.

Mr. Fosbroke first made himself known as an author in 1796, by the publication of a poem entitled ‘The Economy of Monastic Life, as it existed in England, with Philosophical and Archaeological Illustrations,’ &c. It is in the Spenserian stanza, but in the style, as well as in the title, it was intended, it seems, as an imitation of Darwin’s ‘Economy of Vegetation.’ It is reprinted at the end of the third edition of his

'British Monachism.' That work, the full title of which is 'British Monachism, or Manners and Customs of the Monks and Nuns of England,' first appeared in 2 vols. 8vo in 1802; a second edition, much enlarged, was published in 1 vol. 4to in 1817; and after the author's death a third edition in 1 vol. 8vo, was brought out under the care of his son, the Rev. Tate Fosbroke, vicar of St. Ives; London, 1843. In 1807 Mr. Fosbroke published by subscription two volumes 4to of 'Abstracts of Records and MSS. respecting the County of Gloucester,' forming a contribution of raw materials for a county history. Soon after his removal to Walford, in 1810, he is said, in the 'Memoir' published by his family, to have illustrated the unpublished statues in Mr. Hope's collection; but what may be the precise meaning of that we do not know. About this time he was much incommoded by the bankruptcy of Sir Richard Phillips, the publisher, for whom he had made considerable progress in compiling a work to be entitled an *Archæological Dictionary*. In 1814 he published 'A Key to the New Testament, or Whitby's Commentary abridged;' in 1819, 'An Original History of the City of Gloucester,' 8vo; in 1820, 'The Wye Tour,' 8vo, several times reprinted; in 1821, 'Ariconensia, or Archæological Sketches of Ross and Archenfield,' 8vo; and in 1821, 'Abstracts and Extracts of Smyth's (MS.) Lives of the Berkeleys.' His principal work, 'The Encyclopædia of Antiquities, and Elements of Archæology,' came out by subscription, in 2 vols. 4to in 1824; and a second edition, in 1 vol. 8vo, appeared in 1840. It was followed by a 'Picturesque and Topographical Account of Cheltenham and its Vicinity,' 8vo, 1826; 'The Tourist's Grammar,' 12mo, the same year; and 'Foreign Topography, or an Encyclopædic Account, alphabetically arranged, of the Ancient Remains in Asia, Africa, and Europe, forming a sequel to the Encyclopædia of Antiquities,' 4to, 1828. His narrow circumstances were somewhat relieved by his being elected, in 1827, an honorary associate of the Royal Society of Literature, which brought him an allowance of 100*l.* a year till the royal bounty was withdrawn from the society in 1831. Besides the above works he contributed some papers on English history to the volumes of the 'Transactions of the Society of Literature;' was a regular correspondent of the 'Gentleman's Magazine' for several years previous to the termination of the original series of that work in 1834; and wrote three or four minor works.

Mr. Fosbroke possessed a considerable knowledge of English antiquities, and also of general archæology, in the study of which departments of inquiry he had spent his life; and his 'Encyclopædia of Antiquities' and 'British Monachism' are convenient books, though rather of reference than of authority. He had no accurate learning, and his judgment and acuteness were about on a level with his scholarship. All his books are rather popular compilations than anything higher.

Mr. Fosbroke married in 1796 Miss Howel of Horeley, by whom he had four sons and six daughters. Seven of his ten children survived him.

(Autobiographical sketch prefixed to 4to ed. of his *Enc. of Antiquities*, 1824; memoir prefixed to *Brit. Monachism*, ed. 1843; and *Gentleman's Mag.*, Feb. 1842.)

FOSCARINI, MARCO, was born in 1698, of an old patrician family of Venice, which has produced many distinguished men. He studied at Bologna, after which he was employed in various official situations in the service of his country. In 1733 he was sent ambassador to the Emperor Charles VI. He remained at Vienna for several years, and he had the arduous task of maintaining the neutrality of Venice during the war of 1733-35 between the French and the Austrians, on the occasion of the Polish succession. He there wrote an interesting account of the court of Vienna, its politics, and its administration, especially of its Italian dominions, in which he pointed out the latent causes of the sudden reverses which the Austrians experienced in that campaign, and by which they lost the kingdoms of Naples and Sicily. This work remained inedited until 1843, when it was published by J. P. Vieusseux at Florence, 'Storia Arcana ed altri Scritti inediti di Marco Foscarini,' 1 vol. 8vo, forming part of a series of inedited or rare Italian historical works, entitled 'Archivio Storico Italiano,' published under the superintendence of a society of learned men in Tuscany. One of the merits of Foscarini as an historian is his conscientiousness and love of truth.

After his return from Vienna, Foscarini was sent ambassador to Rome, and afterwards to Turin, where he supported the principle of neutrality adopted by the Venetian senate during the war of the Austrian succession. In his various embassies he compiled, according to the custom of the Venetian diplomats, well-digested 'relazioni,' or reports, not only of his personal transactions with foreign statesmen, but also what he had observed and learnt concerning the political principles and views of the various courts of Europe. And whilst he adhered, according to his instructions, to the system of strict neutrality cherished by the Venetian senate, he warned his employers of the necessity of being prepared for all contingencies amidst the change that was taking place in the relative position of the great powers of Europe—a warning which, had it been attended to, might have saved Venice half a century later.

On his return from his Turin embassy he was appointed Riformatore dello Studio di Padova, or superintendent of that university, in which he effected useful reforms and improvements. About this time he

delivered in the Great Council of Venice an oration, in recommendation of the revival of an ancient custom of sending from time to time extraordinary inspectors into the province of Dalmatia for the purpose of discovering and correcting the abuses that had crept into the administration of that important but long-neglected country: and this motion was carried. His oration was published long after his death at Venice in 1831, with illustrations by Cicogna, 'Della Necessità di spedire Inquisitori di Stato in Dalmazia, Orazione inedita di Marco Foscarini.' In 1752 he published the first volume of his history of Venetian literature, 'Della Letteratura Veneziana libri otto, di Marco Foscarini, Cavaliere e Procuratore, volume primo,' fol., Padova, 1752. This work, which was considered to be a model of literary history, established the reputation of Foscarini as an author. The style of the work is concise and dignified, and the authorities are carefully quoted and discussed in copious notes. Moschini published a sort of continuation of the work in his 'Della Letteratura Veneziana del Secolo XVIII.'

In May 1762 Foscarini was elected doge, but his tenure of that dignity was short, for he died in the following March, 1763, generally regretted. He was one of the last distinguished statesmen of Venice. He left a rich and very select library of books and manuscripts, which was sold after the fall of Venice in 1799. The Emperor of Austria purchased the collection of manuscripts for 10,800 livres, and they are now in the imperial library at Vienna. A catalogue of the historical part of the collection, consisting of nearly 400 manuscripts, which were among the materials by the aid of which Foscarini compiled his history of Venetian literature, is given at the end of the 'Storia Arcana,' noticed above, together with two letters of Foscarini, 'On the Manner of Writing History.'

Besides the works mentioned in the course of this article, several minor productions of Foscarini have been printed, such as an oration delivered in the Great Council in support of the institution of the Council of Ten; his report of his Turin embassy, which gives much valuable information concerning the Sardinian monarchy, and which was published in the first volume of the 'Mercurio Italiano' in London, and was republished with comments by Cibrario in 1830; a 'Discorso sulla Necessità della Storia e della Facoltà del ben Dire per gli Uomini di Repubblica,' published at Venice in 1819; and another, 'Intorno ai metodi e alla forma della Veneta Repubblica.' A number of Foscarini's writings remain inedited in the library Del Seminario at Venice, in the library of St. Mark, and in his own collection now at Vienna. Ludovico Arnaldi and others wrote biographical notices of Foscarini at the time of his death; and Professor Sibillato, of Padua, wrote an oration, 'Intorno all' Eloquenza del Foscarini.'

(Tibaldi, *Biografia degli Italiani Illustri del Secolo XVIII.*; Preface to the *Storia Arcana* of Foscarini.)

FOSCHINI, ANTONIO, born June 16, 1741, at Corfu, was the son of Ferrarese parents, and always called himself a native of Ferrara, because he had been brought up from his infancy in that city. His first professional studies was directed by his father chiefly towards engineering and hydraulics, but his own taste pointed out architecture as a more congenial pursuit, and to that he applied himself with the utmost diligence. Appointed to the professorship of architecture when Clement XIV. endeavoured to restore the University of Ferrara to its former splendour, Foschini laboured to impress upon the students the importance of attending to those fundamental principles which had been more or less disregarded or lost sight of, through aiming at superficial novelty without any freshness of invention for its basis. Yet greatly as his reputation increased, it did not shield him from the intrigues of enemies, who succeeded in at length dispossessing him of his office. He was afterwards nominated, in 1804, to a similar professorship in the university of Pavia, but declined to accept it. In like manner he refused the overtures made to him both from Vienna and Rome: his attachment to Ferrara, joined to his indifference for wealth, prevailing over all other considerations. He remained at Ferrara till his death, December 14, 1803.

The principal building executed by him was the theatre at Ferrara, reputed one of the most spacious, well-arranged, and elegant structures of its kind in Italy. It should be observed however that it is said to have been originally begun by Cosimo Morelli [MORELLI], Foschini afterwards improving upon his designs. What would have added both to his own renown and that of Ferrara, was Foschini's design for completing the great tower of the Duomo, which, had it been executed, would have rendered the tower one of the loftiest in Europe, but the want of adequate funds caused the project to be laid aside. Unfortunately, too, neither that nor any other of the numerous designs or manuscript treatises on architecture which he left at his death, has been published. The fame of the theatre of Ferrara is said to have brought him commissions for designs for others from Vienna, Verona, and Ancona; the only other theatre known to have been executed from his designs, is one at Lendinara. The great hospital at Comacchio is another edifice by him; and shortly before his death he was engaged in preparing designs for a basilica at Bandeno, in the territory of Ferrara.

FOSCOLO, UGO, was born at Zante about the year 1777, of a Venetian family settled in the Ionian Islands. When yet a boy he lost his father, who was a physician and inspector of the hospitals at Spalatro in Dalmatia, and he returned with his mother to Venice, from whence he was sent to study at Padua. Having left that uni-

versity without having made up his mind to any particular profession, he returned to Venice and wrote a tragedy, 'Il Tieste,' which was performed in January 1797. In that same year the ancient aristocracy of Venice fell by the hands of Bonaparte, and Foscolo, who, like others of his countrymen, had expected the establishment of a new and popular republic, felt bitterly disappointed at the conqueror giving up Venice to Austria. At Milan and Florence he gave vent to his excited feelings in the 'Lettere di due Amanti,' afterwards published under the name of 'Lettere di Ortis.' This work, of little value as a novel, possesses a higher sort of interest from the political allusions, the bursts of invective, and the picture of society in those disjointed times, which it contains. The language is beautiful and the tone affecting, though too querulous and desponding; but as such it was in harmony with the then prevailing feeling. The 'Lettere di Ortis' had a prodigious success in Italy; but all the editions were mutilated except a private one printed at Venice in 1802, and that of 1814, which Foscolo himself published at Zurich with the date of London, which alone contains, among several passages left out in the other editions, the letter dated 17th of March 1798, in which Foscolo clearly expressed his opinion of Bonaparte's character. Foscolo served as a volunteer in the Lombard Legion through the disastrous campaign of 1799, and followed the French in their retreat to Genoa, where he remained during the siege of that city till June 1800, when the garrison capitulated, and was carried to France by the English ships. Meantime the battle of Marengo took place, Lombardy was reconquered, and Foscolo repaired to Milan; peace being concluded soon after, he returned to private life and to his literary pursuits.

In 1802, Bonaparte having called together at Lyon a meeting of Italian deputies in order to devise a new constitution for the Cisalpine republic, Foscolo was requested by some individuals then in office, to write an address to the First Consul, with an exposition of the state of the country, and the wishes of the people. He did write it, but in a very different strain from what they expected: he drew an eloquent but fearful retrospect of the oppressions, the depredations, the injuries of every kind which the people of Italy had suffered at the hands of the various military and civil authorities appointed by the French since 1796; the disgraceful persecution of the clergy and the so-called aristocrats, and other abuses of party triumph. This oration was, of course, never read to the First Consul, but it was published some time after at Milan—"Orazione a Buonaparte pel Congresso di Lione:" it forms an important memorial of the times, and an honourable testimonial of the uncompromising spirit of Foscolo, who seems to have taken Dante and Alfieri for his models. Foscolo remained for some years quietly at Milan under the mild administration of the vice-president Melzi. He published an Italian version of Callimachus 'De Coma Berenice,' with interesting notes and commentaries.

In 1805 we find him again serving in an Italian regiment which formed part of the army assembled near the coast of the British Channel for the intended invasion of England. Being stationed at St. Omer he there attempted an Italian translation of Sterne's 'Sentimental Journey,' in which he was most successful. When a few months after the camp of Boulogne was broken up, Foscolo went back to Milan, and did not return into active service. He lived for some time near Brescia, where he wrote his poem, 'Dei Sepolcri,' 1807, deprecating certain harsh regulations which forbade any monument or memorial being raised over the tombs of the dead. This beautiful little poem, full of lofty thoughts and lyric power, was dedicated by the author to a brother poet, Ippolito Pindemonte of Verona, and it secured to Foscolo a distinguished rank among the Italian poets. It was commented on, imitated, and even translated into Latin hexameters.

In 1808, Foscolo being appointed professor of Italian eloquence at Pavia, was privately urged by some official persons to begin his course by some tribute of praise to the emperor Napoleon, according to the received custom; and it was hinted to him that the decoration of the Legion of Honour would be the reward of his compliance. Foscolo remained unmoved: he took as the subject of his inaugural oration the origin and the object of literature—"Dell' Origine e dell' Ufficio della Letteratura;" and descanted on the moral and civil duties of literary men; on the nobleness of their calling when conscientiously exercised; and he exhorted the Italian youth to devote themselves to literature for its own sake; "to study above all the history of their country, and the lives and works of Dante, Machiavelli, Galileo, and Tasso; to bend over their tombs and learn from those illustrious dead how they fed the sacred fire of genius through persecutions, torments, and exile, in the gloom of dungeons and amidst the squalidness of domestic poverty, and how they were supported in their trials by the love of their country, of truth, and of fame, which enabled them to leave to posterity the rich legacy of their works and the benefit of their example." This address, delivered before a numerous audience, produced a thrilling sensation, and was followed by bursts of applause. Not a word had Foscolo said about emperor or prince, government or minister. A few months after the chair of Italian eloquence was suppressed in all the universities of the kingdom of Italy, and Foscolo retired to Borgo di Vico, near Como, where he enjoyed the society of Count Giovinetti and his family. He there wrote his tragedy of 'Ajax,' which was performed at Milan, and not only proved a failure, but involved him in a sort of ministerial persecution, because he was suspected to

have alluded in his play to Napoleon's ambition. At the same time certain academicians whose pedantry he had ridiculed in another work, expressed their opinion in the *Polligrafo*, a literary journal, "that whoever sneers at the labours of professors, academicians, and librarians, taxes thereby with ignorance the monarch who protects them, and becomes, by so doing, guilty of treason." Foscolo however had some influential friends, and he was merely banished from Milan. At Florence, where he fixed his residence, he completed his translation of 'Sterne': 'Viaggio Sentimentale di Yorick lungo la Francia, traduzione di Didimo Chierico;' and wrote another tragedy entitled 'Ricciarda,' a Hymn to the Graces, and other compositions.

In 1813 he was allowed to return to Milan, and in the following year, when the French abandoned the country and a provisional government was formed, Foscolo was appointed major on the staff, and endeavoured, though ineffectually, to save the ex-minister Prina from the fury of the mob. When the Austrians took possession of Milan, Foscolo drew up a protest in the name of the inhabitants of Lombardy addressed to the allied powers. He remained however still at Milan, and had the offer from some of the Austrian authorities of the editorship of a new literary journal; but having learnt that he was charged by the more rigid patriots with being a turncoat, and on the other hand finding that if he remained he would have to serve in the militia, he, all of a sudden, disappeared from Milan towards the end of 1814, and repaired to Switzerland, where he resided for almost two years, chiefly at Hottingen, near Zurich. Here he published a correct edition of his 'Lettere di Ortis,' and also a satire in Latin prose, entitled 'Dilemni Clerici Prophetæ Minimi Hypercalypseos,' in which he lashed his Milan enemies of the literary and courtly coteries who had annoyed him about his 'Ajax.' Not finding sufficient encouragement in Switzerland for his literary labours as a means of subsistence, he came to England about the end of 1816, and was introduced into some of the best society of the metropolis: he formed literary connexions, delivered a course of lectures on Italian literature, and wrote articles both for the *Edinburgh* and *Quarterly Reviews*. In London he published his 'Ricciarda,' the *Essays on Petrarch and Dante*, which are among his best compositions, the 'Discorso Storico sul testo del Decamerone,' and the 'Discorso Storico sul testo di Dante,' which is a work full of erudition. He had engaged to superintend a new edition of Dante, with ample commentaries, but he did not live to finish this work. Want of order, extravagance, the unbridled indulgence in licentious habits, and an immoderate love of gaming, combined with the absence of all judgment in money matters, involved him in embarrassments, which, joined to his fretful and overbearing temper and assiduous application, shortened his days. He died of the dropsy on the 10th of October, 1827, at Turnham Green, near London, being fifty years of age, and was buried in Chiswick churchyard, with a plain marble slab and inscription over his tomb. Notwithstanding his evil temper and many eccentricities, to use a very mild term, he secured wherever he lived some warm and lasting friends, who felt his death as a loss. The life of Foscolo derives a certain importance from the times he lived in, and the political scenes in which he mixed. He had the merit of standing aloof, one of the few, amidst the general prostration of his countrymen before the shrine of Napoleon. "His unconquerable silence," observes a by no means partial biographer, "amidst the strains of vulgar adulation, deserves to be recorded in history. If amidst the Asiatic idolatry towards Napoleon, any kind of opposition can be said to have existed in Italy, Foscolo must be considered as the leader of it." (Pecchio, 'Vita di Ugo Foscolo.') When the reaction came he refused likewise to associate with those who would not restore his country to national independence. His sentiments, as expressed in his works, are never those of a partisan; he deals out with an impartial hand to all; his thoughts are often generous and pure, his learning is real, and he has added fresh vigour to Italian prose. His dramas are the weakest of his productions. To his compositions already mentioned, may be added an Italian version of some cantos of the *Iliad*, 'Alcuni scritti e trattati inediti,' Lugano, 1829, including some of his lectures at Pavia, and various poetical effusions.

(*Opere Scelte di Ugo Foscolo*, 2 vols. 8vo; Fiesole, 1833; Gemelli, *Della Vita &c. di Ugo Foscolo*; and articles on Foscolo in No. XVIII. of the *Foreign Quarterly Review*, May, 1832.—*Athenæum*, Dec. 14, 1850.)

FOSSATI, DOMENICO, born at Venice in 1743, was the son of Giorgio Fossati, who, besides practising as an architect, was also a painter and engraver. The elder Fossati may also claim to be considered an author, having published in 1747 an Italian translation of Felibien's 'Lives of Architects,' a second edition of which appeared in 1775. Gifted with a fertile imagination, and delighting in the poetic effects which architecture is capable of producing, Domenico chose for himself a walk of art which, although generally looked upon as a secondary one, enabled him to improvise at will the most splendid conceptions, quite unchecked by either utilitarian or necessitarian considerations. Having finished his studies, he commenced scene-painter, and was abundantly employed not only as such, but in adorning various palaces and churches with architectural and other decorative painting. On the Teatro di San Benedetto in Venice being burnt down in 1775, he made a model for a new edifice; yet greatly as it was admired, it was not adopted, on account of being found too expensive. He however painted a great deal of the scenery for the

new theatre, as he afterwards did for those of San Samuele and San Luca in that city. When Venice was visited by Pius VI., and by the Grand Duke and Duchess of Russia in 1782, Domenico and his father had the charge of getting up the splendid preparations made in honour of those high personages. Nor was Venice the only field of his talents: he resided for some time at Udine, where, besides painting for the theatre, he was employed in decorating several palaces; after which he was engaged successively at Padua, Vicenza, and Verona, one of his important performances being the ceiling of the church of Martellago. Those labours terminated, he went to Milan, and assisted Piermarini [PIERMARINI] in the internal decorations of the theatre of La Scala, then just erected; after which he painted for the theatre at Monza, and that at Gratz, and while at the latter place received invitations from both Rome and St. Petersburg. He was however induced by his friends to decline them, and to return to Venice, but there a disaster awaited him which neither they nor he could foresee. He had just finished painting a ceiling in the Palazzo Contarini, and was standing upon the scaffold with some of his assistants, when a workman incautiously removed one of the props, and all were precipitated to the ground. The only one who received any serious injury was Fossati, who broke his leg, and died in consequence, within less than a month afterwards, August 15, 1784.

FOSSOMBRO'NI, VITTO'RIO, born in 1754, at Arezzo in Tuscany, of a noble family, studied at Pisa, and applied himself especially to the mathematical sciences, for which he showed a particular aptitude. In 1782 he was appointed, by the Grand-Duke Leopold I., inspector of the property of the military order of San Stefano, and in 1785 he was made commendatory of that order. In 1792 he was consulted by the Grand-Duke Ferdinand III. on the subject of the corn-trade and corn-laws, upon which he wrote a treatise, which has not been published. In 1794 he was appointed hydraulic superintendent of the Val di Chiana. Fossombroni had previously studied the ground attentively, and had written a learned treatise on the causes which had led to the encroachment of the waters over that low but fertile district, and had pointed out the means of draining the country: 'Memorie Idraulico-storiche sopra la Val di Chiana,' 1789. He promoted the works for that object, which having been continued through a succession of years, at last restored the valley of the Chiana to fertility and salubrity. In 1796 Fossombroni was appointed Minister for Foreign Affairs of the Grand-Duke of Tuscany. When the French took violent possession of the country in 1799, Fossombroni accompanied his master to Vienna, where the grand-duke gave him leave to return home to attend to his own affairs. After Tuscany was transformed into a kingdom, the new queen of Etruria appointed Fossombroni in 1804 member of the Commission of Finance. In April 1805 he was sent, jointly with the Prince Corsini, to Milan, to compliment Napoleon on his assumption of the crown of Italy. When Tuscany was annexed to the French empire, Napoleon made Fossombroni a member of the Legion of Honour, and appointed him president of the commission for the improvement of the Campagna of Rome and the drainage of the Pontine Marshes, on which he wrote a report for the emperor. On the restoration of the Grand-Duke Ferdinand to his paternal dominions, Fossombroni was one of the first persons employed in the new ministry. He was made president of the legislative commission, councillor of state, minister for foreign affairs, with the presidency of the other departments of the government. These offices he retained till his death, which took place in 1844, when he was ninety years of age, having retained all his mental faculties to the last. In 1832, when he was seventy-eight years of age, he married a lady of a noble family of his native town, Arezzo.

Besides the works already mentioned, Fossombroni published the following works on hydraulics: 1, 'Memoria sopra la Distribuzione delle Alluvioni;' 2, 'Memoria sulla Resistenza ed Urto dei Fluidi;' 3, 'Illustrazione di un Antico Documento relativo all' originario Rapporto tra le Acque dell' Arno e della Chiana,' 1826; 4, 'Memoria sulla Relazione tra le Acque dell' Arno e quelle della Chiana,' 1839. In these last two papers he explained the remarkable change that has taken place in the course of ages in the declivity of the bed of the Chiana, which in ancient times afforded a water-communication between the Arno and the Tiber. He also adverted to the danger to which the city of Florence and the surrounding country were exposed, in consequence of the alluvial deposits which are carried by the Chiana and numerous other streams into the Arno, and which tend to raise the bed of the Arno; 5, 'Saggio sulla Bonificazione delle Paludi Pontine;' 6, 'Memoria sul Lago di Fucecchio,' another marshy district of Tuscany, in the valley of the Lower Arno; 7, 'Relazione sopra l'Incanalamento di un Tronco del Fiume Arno;' 8, 'Memoria sulle Mureme Toscane;' 9, 'Memoria sopra la Inclinazione Artificiale.' Fossombroni wrote numerous other memoirs on hydraulic subjects, which are inedited; among the rest, a memoir on the lagoons of Venice, for the Emperor of Austria, which was used for the works in that quarter, and another memoir for Mehemet Ali, pasha of Egypt, concerning the construction of a basin at Alexandria. Fossombroni also wrote several treatises on mathematics and mechanics, among others a 'Saggio sopra il Moto degli Animali e sopra i Trasporti,' a treatise 'Sopra la Misura delle Forze Muscolari,' another, 'Sopra la Velocità della Forza e degli Attriti,' and a 'Memoria sopra il Principio delle Velocità Virtuali,' published in 1796, and

which was highly praised by Lagrange, Lacroix, Laplace, and other eminent mathematicians.

As a statesman, Fossombroni was enlightened and unprejudiced. Jealous of the independence of his native country, he asserted its rights upon every occasion during the long and occasionally critical period of his administration; he maintained the freedom of commerce, which has greatly contributed to the prosperity of the country; he advocated toleration of opinions, and he strove to render Tuscany a model of a paternal but enlightened government. His system appears to have been to govern without bustle and noise, to let society move on with as little apparent interference as possible on the part of the governing powers, a task in which he was assisted by the disposition of the people, the smallness of the state, and by his own temperament. It is generally admitted that during Fossombroni's administration Tuscany was the happiest country in Italy.

(*Rivista Ligure*, and other Italian journals for 1844; *Communications from Italy*, and the works of Fossombroni quoted above.)

FOSTER, JOHN, architect, was born about the year 1786 or 1787, and was the son of a builder of the same name, who carried on a large business in Liverpool where he also acted as architect and surveyor to the corporation, and as engineer to the docks. Foster junior was the second of six sons. According to one account furnished to us, he became a pupil of James Wyatt; and from other information it would seem that he was also employed under Jeffry Wyatt, afterwards Sir Jeffry Wyattville. In 1809 he went abroad; he was during some time with Mr. Cockerell at Ægina and Phigaleia; and was concerned in the excavation of the Æginetan and Phigaleian marbles. The portico at Ægina—that of the temple of Jupiter Panhellenius—became a favourite model with him in his later practice as an architect. He did not return to England till 1816 or 1817, having in the meanwhile, at Smyrna, married a Greek lady of that place. However, about the time mentioned, he settled at Liverpool; and for some years afterwards carried on the building business, in partnership with a brother, under the firm of John Foster and Co.—his father having withdrawn, but retaining his professional appointments with the corporation and dock trustees. It does not appear that the numerous buildings in which Foster, senior, was concerned, were erected from his own designs; Foster, junior, however had received better education in art; and for some time, besides his building trade, had considerable practice as an architect. St. John's Market, in Liverpool, a covered area of little short of two acres, and one of the earliest works of its character, was commenced in 1820, "from the designs of Mr. John Foster, the corporation-surveyor of the day, and was completed and opened in 1823." ('The Architectural History of Liverpool,' paper by Mr. J. A. Picton, read at the Liverpool Architectural Society; see 'The Builder,' vol. xii. p. 231.) It is probable however that such architectural design as there is in the work was due to the younger Foster, who with his partner carried on the erection of the principal Liverpool buildings. But Foster, senior, having been compelled by ill-health to resign his several appointments, Foster junior was appointed in February 1824 corporation architect and surveyor, receiving a salary of 1000*l.* per annum, conditional upon withdrawal from the building business. When the Municipal Reform Bill came into operation in June 1835, much of the influence of the Foster family was brought to an end, and John Foster retired with a compensation of 500*l.* per annum, and did not afterwards follow his profession.

Few architects have had opportunities similar to those of John Foster. It may however be questioned whether he succeeded in turning these to proper account. That he had acquired a large stock of architectural knowledge cannot be doubted; but, like many of his contemporaries, he missed the special beauty of art in architecture in his manner of using the Greek models; and perhaps there is no town which now so well affords illustrations of two different systems of practice, as does Liverpool in some of the works of Foster and the great work of Elmes. [ELMES, HARVEY LONSDALE.]

Amongst Foster's works is the church of St. Michael, Pitt-street, commenced in 1816, though not completed till 1826; it is of exceptional character, having a portico and steeple obviously adapted from the church of St. Martin-in-the-Fields in the metropolis, but is by many considered his best work. The church for the School of the Blind first erected in Hotham-street, and since removed and re-erected in Hardman-street, is described as originally presenting a somewhat imposing effect in its Grecian Doric columns. This has been impaired by alterations in the removal. The small chapel of St. James's cemetery in the same style, has a better effect from its site near the edge of the rock,—in that particular really adopting certain good Greek principles of art. The Custom House, though a very large building, is of little merit in point of art. It has a portico, as it has been pointedly remarked, advanced from each of its sides except that on which the sun shines. "There are no indications," says Mr. Picton, "such as are stamped on every line in St. George's Hall, of careful study and creative power." The screen of the Railway Station in Lime-street, built about the year 1835, is of more florid character. It has attached Corinthian columns, and is not without merit.

Foster died on the 21st of August 1846, after a long and painful illness. He was a Fellow of the Royal Society; was undoubtedly possessed of great architectural knowledge; holds an important place in the recent history of architecture, but perhaps deserves commendation.

tion for his general good qualities, rather than for high powers as an artist-architect.

FOSTER, REV. JOHN, was the son of a small farmer residing between Wainwright and Hebden Bridge, Halifax, Yorkshire, where he was born September 17, 1770. He was, as a youth, placed with a weaver; but having in his seventeenth year joined the church of the Rev. Dr. Fawcett, baptist minister, of Hebden Bridge, he quickly attracted the notice of that gentleman, and by his interest he was entered a student of the Baptist College, Bristol, in 1791.

Having completed his studies he became a preacher, and in 1797 accepted the charge of a congregation at Chichester, Sussex. There he remained for about two years and a half; he then continued till 1804 without any pastoral connection, his attention being much occupied with literature. In 1804 he became the minister of a chapel at Frome in Somersetshire, but a morbid state of the thyroid gland unfitted him for preaching with energy, and he resigned his office in 1806. He now became regularly connected as contributor to the 'Eclectic Review,' in which his first article appeared in November 1806, and his last in July 1839. For eleven years he remained unconnected with any church as minister, when his health being thoroughly established, he, in 1817, accepted a charge at Downend, near Bristol. But his preaching being unacceptable to his congregation—by no means a literary one—he, after a trial of only a few months, relinquished active pastoral duties, and for the last eighteen or twenty years of his life resided at Stapleton, near Bristol, chiefly occupied in literary occupations, and preaching only occasionally. He died at Stapleton, October 15, 1843.

Foster's reputation as an author is chiefly founded on his 'Essays,' which were first published in 1805, in the form of a series of letters, which, though intended for publication, were really addressed to the lady who soon afterwards became his wife. The 'Essays' are on the following subjects:—1, 'On a Man's Writing Memoirs of Himself;' 2, 'On Decision of Character;' 3, 'On the Application of the epithet Romantic;' 4, 'On some of the Causes by which Evangelical Religion has been rendered Unacceptable to Persons of Cultivated Taste.' The only other work which he published in a separate form was 'An Essay on the Evils of Popular Ignorance,' which grew out of the topics of a discourse delivered at a public anniversary meeting in aid of the British and Foreign School Society, and which he afterwards expanded into a volume of moderate size. To the 'Eclectic Review' he contributed altogether 185 articles, of which fifty were selected and published in a separate form in 1844. Two volumes of lectures, delivered at Broadmead in 1822, and edited from Foster's notes by his friend Mr. J. E. Ryland, have been published since Mr. Foster's death.

John Foster's writings occupy only a small space, but they are of great merit. The 'Essays' have gone through some twenty editions, and their popularity has certainly not diminished. Foster's intellect is of a high order, clear, comprehensive, and of strong grasp. He displays an intimate knowledge of the various forms of human character, draws his remarks from a wide extent of personal observation as well as a large acquaintance with books, and is almost entirely free from party views or sectarian feelings. His thoughts are unborrowed, his morality high and pure, and his views, whether relating to public government or private conduct, are independent, lofty, and liberal. His composition is very elaborate, yet natural and graceful; it has no appearance of having been modelled on the style of any other writer, but always seems to flow with the unrestrained current of his thoughts, generally with a tendency towards expansion, yet often concise, nervous, and impressive.

The 'Essay on the Evils of Popular Ignorance' consists of a series of arguments on the necessity of a comprehensive scheme of popular education. It is very powerfully written. To some of the editions is annexed his sermon in defence of Christian missions, which is much admired.

Foster was eminently qualified for a reviewer as well as an essayist. His strong good sense, his wide range of knowledge from books and observation, his perfect independence of mind, thorough conscientiousness, power of sarcasm as well as of eulogy, pure taste, and attractive style, all contributed to fit him for sitting in judgment on works of general literature.

In person Foster was rather above the middle size. His countenance was handsome and striking. His social character is described as having been very attractive. His range of topics in conversation was extensive, embracing not only such subjects as those treated of in his writings, but including the fine arts, of which he was an enthusiastic admirer, and almost every department of ancient and modern literature.

(*Gentleman's Magazine*, January, 1844; *Eclectic Review*, February and May, 1844; Ryland, *Life and Correspondence of John Foster*.)

FOTHERGILL, JOHN, was born of a Quaker family, on the 8th of March 1712, at Carr-End, near Richmond, in Yorkshire. After obtaining the elements of education in the school of Sedburgh, in the same county, he learned pharmacy from an apothecary named Bartlett, and then proceeded to Edinburgh. Here he took his degree of M.D. in 1737, the thesis which he published on this occasion being on the use of emetics. ('*De Emeticorum Usu in variis Morbis tractandis*.) In order to become a physician in practice as well as theory,

he now diligently attended St. Thomas's Hospital, in London. In 1740 he travelled into Holland, France, and Germany, and then settled in London. In 1748, an ulcerated or gangrenous sore throat, which had prevailed epidemically, gave Fothergill an opportunity of displaying his great practical talents. This kind of sore throat is now believed to be related to scarlet fever, and indeed to be the essential and dangerous part of that disease, of which the eruption is merely the outward and harmless indication. In Fothergill's time however this malady was confounded with the ordinary or inflammatory sore throat, and being treated accordingly, with bleeding and purgatives, was very fatal. Fothergill, on the contrary, used emetics, mineral acids, bitters, and a little wine, and lost but few cases.

The two most prominent points in the life of Dr. Fothergill are the remarkable success with which he practised his profession and the unwearied benevolence with which he distributed the fruits of his labours. It is supposed that he gave away at least 200,000*l*.

Dr. Fothergill published several papers in the 'Philosophical Transactions' on the origin of ambergris, the rupture of the diaphragm, &c.; and he is also the author of essays on the plant producing Aleppo scammony; on the use of bark combined with small doses of calomel in scrofula, and calomel alone in sciatica, lumbago, and worms; on the use of hemlock in cancer; on the botanical, chemical, and medical history of the cortex Winteranus and catechu; on the treatment of hooping-cough by very small doses of tartar emetic combined with an absorbent earth; on dropsy, and the disadvantages of putting off tapping too long; on chronic ulcers of the legs; on phthisis, and the abuse of balsams and bark in this disease; on febrile rheumatism of the face; on angina pectoris; on the ulcerous sore throat; on hydrocephalus internus, an essay thought by Vicq-d'Asy to be one of the most perfect descriptions to be found in medicine; and advice to women between forty and forty-five years of age, or rules to be observed on the cessation of the catamenia.

Fothergill improved the art of recovering the drowned; showed the necessity of prohibiting burials in towns, and the means of diminishing the frequency of fires. The editions of his works are those of London, 1781, 8vo; 1783, 3 vols., 8vo; 1784, 4to. Fothergill died on the 26th of December 1780, in the sixty-ninth year of his age.

FOUCHÉ, JOSEPH, Duke of Otranto, was born in 1763 at Nantes, and educated in the college of the Pères de l'Oratoire. Being unable on account of his delicate constitution to follow the profession of his father, who was captain of a vessel, he applied himself to study, and after having completed his course at Paris he lectured in different towns of France on various philosophical subjects, till on his marriage he finally settled in his native town, and began to practice as an advocate. In 1792 he was returned by the department of the Loire-Inférieure as a member of the National Convention, in which capacity he voted for the death of the king, and against the appeal to the nation. In 1793 he was sent with Collot d'Herbois on that mission which deluged Lyon with blood, but still he had the courage to oppose some measures of his infamous colleague. On his return to Paris he was elected (1794) president of the Jacobin Club, but he was soon expelled from it by the enmity of Robespierre. After the fall of Robespierre, Fouché being considered as a dangerous terrorist was arrested, but afterwards liberated under the proclamation for a general amnesty, on the 26th of October 1795. He remained in private life till 1798, when he was employed in Italy, and after his return to Paris the Directory nominated him minister of the police of the republic. It was in this capacity that he displayed his great talents, which were united with an extraordinary degree of courage, firmness, and activity. He had the boldness to adopt vigorous measures for the suppression of popular assemblies. Having supported Bonaparte after his return from Egypt, he was confirmed in his office upon the establishment of the consulate. He had the address to render himself necessary to all parties by tormenting Bonaparte on the one hand with rumours of conspiracies, and on the other by screening from his vengeance many royalists. Bonaparte however dismissed Fouché in 1802 from his office, but on his accession to the throne he restored him to his former post. Fouché's vigilance maintained the tranquillity of the empire while Napoleon I. was occupied in foreign wars; and having the duties of minister of the interior added to those of his office, he greatly contributed by his arrangements to prevent the success of the English expedition against Holland in 1809. In the last-mentioned year he was created Duke of Otranto, but he fell out of favour for having used in his proclamation to the national guards the following expression—"Let us prove that Napoleon's presence is not necessary in order to repel our enemies." In 1810 he was nominated governor of Rome on condition of delivering his correspondence to Napoleon, which having refused to do, he was sent to Aix. He was again recalled, but as his views did not coincide with those of the emperor, Fouché retired into the country. In 1813 Fouché was made governor of the Illyrian provinces, but the progress of the allied troops compelled him to relinquish his post and to retire to Italy.

After the abdication of Napoleon I., Fouché again retired to his estates in the country, and refused to take any part in political intrigues. On Napoleon's return from Elba, he was suspected by the Bourbons, and an order was given for his arrest, but he contrived to make his escape. Napoleon again nominated Fouché minister of

police, but he accepted the office only on the understanding that Austria and England secretly connived at Napoleon's return from Elba. As soon as he learned that the congress of Vienna had declared against Napoleon, he tried to persuade the emperor, in case his negotiations should prove unsuccessful, to abdicate and retire to the United States of America. He strongly advocated the principles of liberty during the hundred days of Napoleon's second reign, and strongly urged the emperor to abdicate after the battle of Waterloo. Fouché being put at the head of the provisional government by the chambers, promoted the departure of Napoleon I., negotiated with the allied powers, and by his intrigues baffled the scheme of Carnot and other patriots to defend Paris. At the beginning of the negotiation he was not inclined to promote the second restoration of Louis XVIII., but notwithstanding this he was called by the king, immediately after the capitulation of Paris, and nominated minister of police. This circumstance gave rise to a general belief that he had deceived Napoleon I. all the time after his return from Elba, and that he constantly maintained a secret correspondence with the allied powers and the Bourbons. In his capacity of minister of police he presented to the king two reports on the state of France, which by their boldness excited the hatred of all parties. His advice to grant a general amnesty was not followed; and he signed with his own hand, as minister of police, the ordinance of Louis XVIII. of the 24th July 1815, by which many persons were excepted from the amnesty. Being driven by the hatred of the royalists to resign his office of minister of police, the king nominated him his ambassador to Dresden. The law of the 12th January 1816, by which all those who had voted for the death of Louis XVI. were banished from France and deprived of the estates which had been granted to them, was extended to Fouché also, who from that time lived in different parts of Austria. He died at Trieste in 1820. 'The Memoirs of Joseph Ant. Fouché, duc d'Otranto,' which appeared at Paris, 1824, were declared by his sons to be a spurious production; and their denunciation was maintained in a suit against the printer, who was condemned in heavy damages; but it is difficult to believe that they are wholly unauthentic. It is a known fact that Fouché dictated his memoirs to his secretary Desmarteau. A curious work was published at Paris in 1833, which throws great light on Fouché's character, and on the system of the imperial administration in France, 'Témoignages historiques, ou quinze Ans de haute Police sous Napoléon, par Desmarteau.'

FOULIS, ROBERT AND ANDREW, two learned printers of Scotland, were, it is supposed, natives of Glasgow, and passed their early days in obscurity. Robert is asserted to have been a barber. Ingenuity and perseverance however enabled them to establish a press, from which have issued some of the finest specimens of correct and elegant printing which the 18th century has produced. Even Bodoni of Parma, and Barbou of Paris, have not gone beyond some of the productions of the Foulis press. Robert Foulis began printing about 1740, and one of his first essays was a good edition of 'Demetrius Phalereus,' in 4to, published in 1743. In 1744 he brought out his celebrated immaculate edition of 'Horace,' 12mo, and soon afterwards was in partnership with his brother Andrew. Of this edition of 'Horace,' the sheets as they were printed were hung up in the college at Glasgow, and a reward was offered to those who should discover an inaccuracy. It has been several times reprinted at Glasgow, but not probably with the same fidelity. The two brothers continued to produce for thirty years a series of correct and well-printed books, particularly classics, which, whether in Greek or Latin, are as remarkable for their beauty and exactness as any in the Aldine series. Among them may be enumerated 'Homer,' Greek, 4 vols. fol., 1756-68; 'Thucydides,' Greek and Latin, 8 vols. 12mo, 1759; 'Herodotus,' Greek and Latin, 9 vols. 12mo, 1761; 'Xenophon,' Greek and Latin, 12 vols. 12mo, 1762-67; with small editions of Cicero, Virgil, Tibullus and Propertius, Cornelius Nepos, Tacitus, Juvenal and Persius, and Lucretius. To these may be added a beautiful edition of the Greek Testament, in small 4to; Gray's 'Poems,' Pope's 'Works,' &c.

It is a melancholy reflection that the taste of these worthy men for the fine arts at last brought about their ruin; for having engaged in the establishment of an academy for the instruction of youth in painting and sculpture in Scotland, the enormous expense of sending pupils to Italy to study and copy the ancients, gradually brought on their decline in the printing business, and they found the city of Glasgow no fit soil to transplant the imitative arts to, although their success in printing the Greek and Latin Classics had already produced them ample fortunes. Andrew Foulis died on September 15, 1776, and Robert in 1776 exhibited and sold at Christie's, in Pall Mall, the remainder of his paintings. The catalogue formed three volumes. But the result of the sale was, that after all the expenses were defrayed, the balance in his favour amounted only to the sum of 15s. He died the same year on his return to Scotland. A person of the name of Foulis, a descendant of one of the brothers, continued to print at Glasgow as late as 1806. His 'Virgil' of 1778, and his 'Æschylus,' printed in 1795, are considered beautiful productions.

(Lemoine, *History of Printing*; Nichols, *Lit. Anecd.* vol. iii., pp. 691, viii., 475; Chalmers, *Biog. Dict.*)

FOULSTON, JOHN. The name of this architect, who died at Plymouth, January 13, 1842, aged sixty-nine, is especially connected

with the history of that town and its neighbourhood, where, during the last thirty years of his life, he enjoyed a very extensive practice, and executed nearly all the public buildings then erected at Plymouth and Devonport (formerly Plymouth Dock), besides various general improvements, such as streets, and lines of uniformly-built houses, distinguished by the name of 'Terraces.' Hence he came to be regarded as the architect *par excellence*, and has been complimented by the title of the 'Wren of Plymouth,' though that of its 'Wood' [Woon] would have been compliment sufficient. That he did much for the general appearance of Plymouth and the places in its vicinity, is not to be disputed: he introduced an improved style of building; but those of his buildings which challenge notice as distinct works of architecture exhibit little more than a smattering of style—those superficial and obvious rudiments of it which at once distinguish one style from another. In the critical meaning of the term, he himself possessed no style, for, applied to the works of an artist, *style* presumes both individuality and generality of expression in that particular language of his art which is employed by him; whereas Foulston's Greek was little more than the neutralisation of Greek, followed in literal transcripts from it with respect to columniation, columns, and a few details, but essentially un-Greek, or pseudo-Greek, in regard to general character. His works in that style are however characteristic of their time, and serve to show what was admired in this country as genuine and 'pure' classical architecture during the early part of the present century, when four-columned Parthenons *without* sculpture and *with* sash-windows were hailed as marvels worthy of Athens itself.

With the exception of Soane and Laing, Foulston was the only one among his contemporaries who published designs of the buildings executed by him. The collection was at first announced as intended to consist of 200 plates, in 4 vols. 4to; but it appeared, in 1838, in a single volume, with 116 plates in lithographic outline, executed in a hard and formal manner. Yet, though no fewer than forty-seven plates are devoted to a single edifice, comprising the Royal Hotel and Theatre, there is neither section nor view to give any idea of the theatre itself, but only drawings explanatory of the carpentry and construction of the stage. However, that publication enables us to do what, highly desirable as it is, is generally most difficult of accomplishment in architectural biography, to give a tolerably full and accurate list of Foulston's buildings. At Plymouth:—Royal Hotel and Theatre, begun 1811, Grecian Ionic; Exchange, 1813; Athenæum, 1818-19, Grecian Doric; St. Andrew's Chapel, 1823; Public Library, Devonport:—Town Hall, 1821-2, Grecian Doric; Civil and Military Library, 1823, Egyptian; Mount Zion Chapel, 1823-4, Hindoo; Column, 1824, Grecian Doric. Tavistock, Old Abbey Buildings, restored, 1829. Torquay, Public Ball-room, 1839. Bodmin, Cornwall County Lunatic Asylum, 1818. Besides the above, which constitute his edited designs, Foulston executed several other buildings, public as well as private, including St. Paul's Chapel, Gothic, and Edgecumbe Place, at Stonehouse; St. Michael's Terrace, Stoke Damerell; Belmont House; and various villas and cottages in the neighbourhood of Stoke, and in other parts of the county. Greatly as he seems to have prided himself upon the correctness and purity of his taste in classical architecture, Foulston was by no means disposed to confine himself to the Grecian style, for he attempted every style in its turn, Egyptian and Hindoo not excepted, and even that of Soane included. The fact is, Foulston seems to have discovered that he had exhausted all his stock of ideas for Grecian designs after employing that style for some of his principal works. It would not do to repeat Grecian Doric and Ionic porticoes, and those mere monoprostyle ones, perpetually, especially in contiguous buildings, and this, no doubt, determined him not only to have recourse to other and widely different styles, but occasionally to bring them together in direct contrast with each other, as at Devonport, where in the Town-Hall, Column, Library, and Chapel, he clustered together into one group Grecian, Egyptian, and Hindoo, the two last of a very spurious kind, one of them being evidently borrowed from the building in Piccadilly, while for the Hindoo there seems to be no better authority than the architect's so naming it. Though without more pretensions to design than many other things of the kind that have been erected all over the country, the Devonport Column stands with an air of very unusual dignity, not merely stilted upon a pedestal borrowed from the broken stylobates of Roman and Italian architecture, but rearing itself upon a lofty substructure of masonry, the whole being on a higher level than the pavement of the street. Yet we suppose the Royal Hotel at Plymouth generally passes for Foulston's *chef d'œuvre*, it being his largest building—one rivalling the post-office at London in size, as well as resembling it in design; for the Plymouth structure measures 268 by 218 feet, the other 390 by 130 feet.

FOURCROY, ANTOINE-FRANÇOIS DE, an eminent French chemist, councillor of state, commander of the legion of honour, member of the Institute, and of most of the academies and scientific societies of Europe, professor of chemistry at the Museum of Natural History, at the Faculty of Medicine of Paris, and at the Polytechnic School, was born at Paris, on the 15th of June 1755, and was the son of Jean-Michel de Fourcroy, and Jeanne Laugier. His family had long resided in the capital, and several of his ancestors had distinguished themselves at the bar. Antoine-François de Fourcroy sprung from a

branch of the family that had gradually sunk into poverty; and his son, the subject of the present article, grew up in the midst of it. When seven years old, he lost his mother, and his sister preserved him with difficulty till he went to college; and in consequence of the ill-treatment of a master he left it at fourteen years of age, somewhat less informed than when he went to it.

While uncertain what plan to follow, in order to obtain a livelihood, the advice of Vioq-d'Ayr, who was a celebrated anatomist and a friend of his father's, induced him to commence the study of medicine; and after successfully struggling against every kind of difficulty, he at last obtained the necessary qualification to practice in Paris. The first writings of Fourcroy did not evince any peculiar predilection for any particular branch of science; he wrote upon natural history, anatomy, and chemistry; he published an 'Abridgment of the History of Insects;' and a 'Description of the Muscles of the Tendons;' and in consequence of the celebrity which he acquired by the last-mentioned performance, he was admitted as an Anatomist into the Academy of Sciences in 1786.

After the death of Macquer, which happened in 1784, he succeeded to the chair of professor of chemistry at the Jardin du Roi, and he continued there till his death, which took place twenty-five years afterwards. He was greatly admired for the eloquence with which he delivered his lectures, and the writer of this article was a witness of his great flow of language during a sitting of the Institute in 1802.

In 1795 he was elected a member of the National Convention, but notwithstanding his reputation for eloquence, from prudential motives he never opened his mouth in the Convention till after the death of Robespierre. After the 9th Thermidor, when the nation was wearied with destruction, and efforts were making to restore institutions which had been overturned, Fourcroy began to acquire influence, and he took an active part in whatever related to the establishment of schools, whether of medicine, or for the purposes of general instruction. Among these was the Polytechnic School, at which, as already stated, he was professor of chemistry; and both as a member of the Convention and of the Council of Ancients, he was concerned in the establishment of the Institute and the Museum of Natural History.

The great exertions made by M. de Fourcroy, and the prodigious activity which he displayed in the numerous situations which he filled, gradually undermined his constitution; he was sensible of his approaching death, and announced it to his friends as an event which would speedily take place. On the 16th of December 1809, after signing some despatches, he suddenly exclaimed, "Je suis mort!" and fell lifeless on the ground.

In his 'History of Chemistry,' Dr. Thomson thus concludes his notice of the works of Fourcroy:—"Notwithstanding the vast quantity of papers which he published, it will be admitted, without dispute, that the prodigious reputation which he enjoyed during his lifetime was more owing to his eloquence than to his eminence as a chemist, though even as a chemist he was far above mediocrity. He must have possessed an uncommon facility of writing. Five successive editions of his 'System of Chemistry' appeared, each of them gradually increasing in size and value: the first being in two volumes and the last in ten. This last edition he wrote in sixteen months: it contains much valuable information, and doubtless contributed considerably to the general diffusion of chemical knowledge. Its style is perhaps too diffuse, and the spirit of generalising from particular and often ill-authenticated facts, is carried to a vicious length. Perhaps the best of all his productions is his 'Philosophy of Chemistry.' It is remarkable for its conciseness, its perspicuity, and the neatness of its arrangement."

Besides these works, and the periodical publication entitled 'Le Médecin Éclairé,' of which he was the editor, there are above one hundred and sixty papers on chemical subjects, with his name attached to them, which appeared in the 'Memoirs' of the Academy and of the Institute; in the 'Annales de Chimie,' or the 'Annales de Musée d'Histoire Naturelle,' of which last work he was the original projector. Many of these papers contained analyses, both animal, vegetable, and mineral, of very considerable value. In most of them the name of Vauquelin is associated with his own as the author, and the general opinion is that the experiments were all made by Vauquelin, but that the papers themselves were drawn up by Fourcroy. There is one merit at least to which Fourcroy is certainly entitled, and it is no small one: he formed and brought forward Vauquelin, and proved to him ever after a most steady and indefatigable friend.

It would serve little purpose to go over this long list of papers. Though they contributed essentially to the progress of chemistry, yet they exhibit but few of those striking discoveries which at once alter the face of the science by throwing a flood of light on everything around them. We shall merely notice a few of what we consider his best papers:—

1. He ascertained that the most common biliary calculi are composed of a substance similar to spermaceti. During the removal of the dead bodies from the burial-ground of the Innocents at Paris, he discovered that the bodies were converted into a fatty matter, which he called adipocire. It has since been distinguished by the name of cholestrine, and has been shown to possess properties different from those of adipocire and spermaceti.

2. It is to him that we are indebted for the first knowledge of the fact, that the salts of magnesia and ammonia have the property of uniting together and forming double salts.

3. His dissertation on the sulphate of mercury contains some good observations. The same remark applies to his paper on the action of ammonia on the sulphate, nitrate, and muriate of mercury. He first described the double salts which are formed.

4. The analyses of urine would have been valuable had not almost all the facts contained in it been anticipated by a paper of Dr. Wollaston published in the 'Philosophical Transactions.' It is to him that we are indebted for almost all the additions to our knowledge of calculi since the publication of Scheele's original paper on the subject.

5. We may mention the process of Fourcroy and Vauquelin for obtaining pure barytes, by exposing nitrate of barytes to a red heat, as a good one. They discovered the existence of phosphate of magnesia in the bones, of phosphorus in the brain, and in the milks of fishes, and a considerable quantity of saccharine matter in the bulb of the common onion, which, by undergoing a kind of spontaneous fermentation, was converted into manna.

In concluding, we may remark that his friendship, free from all selfishness, for Vauquelin, coupled with the well-known fact of his having saved the lives of some men of merit, and among others of Darcet, tends greatly to acquit Fourcroy of the disgraceful charge which has been made against him of having contributed to the death of the illustrious Lavoisier. This acquittal is rendered complete by the annexed declaration of Cuvier in his 'Eloge' of Fourcroy:—"If, in the rigorous researches which we have made, we had found the smallest proof of an atrocity so horrible, no human power could have induced us to sully our mouths with his *Eloge*, or to have pronounced it within the walls of this temple, which ought to be no less sacred to honour than to genius."

FOURIER, CHARLES, founder of the system of communism known as Fourierism, was born at Besançon, in Franche-Comté, on the 7th of April 1772: he died at Paris on the 10th of October 1837, in his sixty-sixth year. He lived and died a bachelor.

He was the son of Charles Fourier, a merchant and magistrate (Juge consulaire) of the city of Besançon, who died when Fourier was in his ninth year, leaving a widow with a family of four children, and a property of about 8000*l*. Fourier was the youngest child and the only son. After completing his studies at Besançon and Dijon, Fourier was placed in a commercial house at Rouen, where he remained a short time, and then removed to Lyon in the year 1790, when the French revolution was commencing. It was a most eventful period. New philosophies and theories were almost annually tried experimentally, and found deficient, notwithstanding their plausibility. Fourier, though young, was led to think of principles and causes; social evils and their remedies; the horrors of convulsive anarchy, and all the aberrations of philosophy which then distracted his unhappy country. He reflected long and deeply on these subjects in the midst of his commercial occupations, and experience confirmed him in the opinion he early formed that something must be radically wrong to cause so much injustice and antagonism in society. He made himself acquainted with the principles and theories of all the leading parties. From them he turned to real science in its various branches; travelled much to gain experience; and laboured constantly with various feelings of alternate fear and hope, to discover the cause of social misery, and an efficient remedy. By the decree of the National Convention, August 23, 1793, Fourier was compelled to enter the army, and was drafted into the eighth regiment of Chasseurs à Cheval, which joined the army of the Rhine and Moselle, where Fourier remained about two years; not without profiting by all that could be learned of scientific evolutions, as his writings indicate, when treating of gymnastic exercises and the disciplines of education. He also paid great attention to the theory of music during his connection with the army; but his health began to sink, and he obtained his release in January 1795. In 1799 he was employed in a commercial house at Marseille, and he had to direct the operation of submerging a considerable quantity of corn by night in order to avoid the vengeance of the people, who were suffering from scarcity of bread in the surrounding country. The wheat which was thus thrown into the sea at midnight had been spoiled by being kept too long. The scarcity of food had been so general in the country that the poor inhabitants of many parts were suffering from famine and disease when this occurred, and Fourier was more impressed than ever with the awful state of social and commercial and political disorder which deranged the general economy of civilised society. His mind had been already fixed upon the problem for about ten years, but the first discovery which he and his followers regarded as one of general importance and undoubted certainty was made soon after this remarkable event in 1799.

In 1800 he passed some months in Paris, and then returned to Lyon, where he published articles in the newspapers, which were noticed by the government for their acuteness and range of thought. One of those articles, published in the 'Bulletin de Lyon,' in 1803, and headed 'Continental Triumvirate,' attracted the attention of Napoleon I., who caused inquiries to be made about the author, but nothing further occurred. Fourier had to work out the details of his plans, and years elapsed before they were sufficiently mature for publication. Meanwhile he was employed as a commercial

agent, and only known to the society in which he moved as a man remarkable for his learning in geography and general statistics. In conversation with his intimate acquaintance he had mentioned many things connected with his new discovery, and they at length induced him to commence publishing before he had completed all the secondary combinations of detail. To satisfy their curiosity he issued a Prospectus, in which his general views were broadly stated, but without an attempt at demonstration. This Prospectus was a small octavo volume, published in 1808, at Leipzig, according to the title-page, but really as it would seem printed and published at Lyon, in order to avoid the censorship of Napoleon.

This Prospectus was intended to announce the publication of his new discovery in a series of eight octavo volumes, to be published by subscription, and commenced as soon as a sufficient number of subscribers had sent in their names. The work was entitled 'Théorie des Quatre Mouvements et des Destinées Générales.' It is the strangest, most mystical, and most startling of all his works, though merely given as a general announcement of his theory. Surprise and wonder were the only effects which it produced on those who read it and the few public writers who reviewed it. After being noticed by a few persons in the neighbourhood of Lyon, it sunk into oblivion, without a dozen copies being sold.

After publishing this voluminous 'Prospectus' of his theory of the cardinal movements, Fourier remained fourteen years without publishing the continuation of his theory. He quietly prosecuted his studies in the solitude of private life, interrupted only by his mercantile pursuits, he still continuing in his mercantile position in Lyon. Little is known of his habits or his movements from 1808 to 1815, except a few incidents mentioned by himself. In one of his unpublished manuscripts, he says, in reference to the long interval which elapsed between his first and second publications, "It was well that I deferred the publication of my theory, for it was not until 1814 that I discovered the principal laws of equilibrium in combined associative harmony, and other branches of transcendental theory. It was not until the year 1819 that I discovered the possibility of organising associative unity without disturbing the present laws of marriage.

"My commercial duties had always prevented me from giving that undivided attention to my discovery which its infinite details required. The stagnation however in which mercantile affairs were plunged by the political events of 1814 and 1815 induced me to retire from business and devote my time exclusively to study. In 1816 I commenced the preparation of materials for publication, but the problems to be solved were so diversified and numerous—the subject so immense—that I could not succeed in bringing them within the limits of an ordinary book. Twelve months were lost in trying to condense the matter and improve the plan of distribution. At length I fixed upon a plan of partial publication, which contained about one-quarter of the whole theory, but sufficient for all purposes of practical association on a simple scale."

During the Hundred Days of Napoleon's reign Fourier was placed at the head of the statistical department of the prefecture or provincial government of Lyon, by his namesake the Count Fourier, but after the second restoration of the Bourbon family everything was changed again, and Fourier retired from Lyon to Tallissieu in the autumn of that year, to pass the winter in his sister's family. From Tallissieu he went to Belley to reside with his other sister, and there he remained from 1815 until 1821, occupied exclusively in preparing the manuscript of his future publication.

Hitherto no one had seriously thought of Fourier's ideas or his studies, but in 1814 a copy of his first volume fell accidentally into the hands of M. Just Muiron, of Besançon, a gentleman of studious habits and high standing in the provincial administration of Franche-Comté, and also proprietor of its leading provincial newspaper, 'L'Impartial de Besançon.'

The views of Fourier's theory announced in that volume made a deep impression on Muiron, who wrote immediately to the author to obtain more information on the subject. This led to a long correspondence and an interview, which tended to confirm Muiron in the high opinion he had first conceived of both the author and his theory. After a due consideration of the principles and an intimate acquaintance with Fourier, from whom he gathered ample information on all points of doctrine, Muiron became the intimate friend and the first avowed disciple of Fourier. He became more anxious than Fourier himself to have the theory completely published, and undertook to furnish a part of the funds for the expense of printing, as soon as the manuscripts could be made ready for the press. Fourier sold a part of his little property to defray the rest of the expense of printing. The correspondence between Muiron and Fourier became frequent. It is an interesting history of Fourier's opinions and pursuits during the period of his studious retirement from 1816 to 1821. The whole of Fourier's theory was written during this period, though not more than half of it has yet been published. The unpublished manuscripts treat however chiefly on cosmogony, psychology, analogy, and other very abstruse subjects, which are treated in a manner not at all likely to attract the general reader.

In one of his letters to Muiron he says, "I have positively failed, after fourteen years' repeated application, to solve the problem of

Passional Diffraction." This, in the language of Fourier, is the principle of prophetic inspiration. It is treated by him as an abstract question, but as the object of this article is to explain some of the opinions of Fourier from his own point of view, we may give it one short paragraph of explanation.

If we compare the light of Revelation from the Spiritual Sun of the universe on the eye of the mind, with the light of the natural sun on the eye of the body, we shall have the exact analogy between the two, in harmony with the language of Fourier. There are three modes of action in the transmission of natural light: *Refraction*, *Reflection*, and *Diffraction*. In the sphere of Revelation, or the transmission of spiritual light to the mind of man, Nature is the great fact of undoubted divine origin, which reflects to the eye of the inquiring mind the law of God, which it reveals in its stupendous harmony. The mind of man itself which is of divine origin also, is the power which refracts or divides the rays of mental light into their magic beauty of variety and colour. *Diffraction* is a mixed mode of action between refraction and reflection; and prophetic inspiration is a mixed mode of mental revelation, written in words similar to human verbalism, and reflecting divine wisdom just like Nature, but participating in the characteristic peculiarities of both; inasmuch, as it is partly reflective without explanation, like Nature; and partly refractive and explanatory, like the word of man. It is that mental or "passional diffraction," which Fourier could not find until he came to look for it in sacred prophecy, which he did before he published his 'New Industrial World' in 1829.

In April 1821, Fourier, having prepared his manuscript for the press, went to reside at Besançon to superintend the printing of his work, which was distributed in nine volumes under the following heads:—

1. 'The Abstract Principles of Passional Attraction, and their Partial Application to Industrial Association.'
2. 'Familiar Synthesis of the Principles of Attraction, and their Equilibrium in Practice.'
3. 'The Analysis of Man's Physical, Moral, and Mental Nature, individually and collectively, with regard to Individual Variety and Universal Unity.'
4. 'Methodical Synthesis, and Transcendental Theory.'
5. 'Commercial Duplicity, and Ruinous Competition.'
6. 'The False Development of Human Nature, and a regular Analysis and Synthesis of False Development in Universal Nature as an exception to Universal Harmony.'
7. 'Universal Analogy and Illustrations of Cosmogony.'
8. 'The Scientific Theory of the Immortality of the Soul.'
9. 'Dictionary of Contents, References, &c. &c. of the whole Work.'

Each of these volumes contains between five and six hundred closely printed large octavo pages. The first and second only, with a few extracts from the others, were printed and published in 1822, under the title of 'A Treatise on Domestic and Agricultural Association'; a second edition with another title was published in 1841; two volumes more were published in 1850 under the title of 'Passions of the Human Soul.' The other volumes, containing some of the more transcendental speculative part of the theory, still remain in manuscript. The title of the whole work, we are informed by Fourier, should be 'Theory of Universal Unity.'

Fourier professes to teach, in the volumes published by himself, the science of associative unity, by which the produce of social industry may be increased from three to sevenfold, and the economy of general and individual expenditure improved tenfold; so that the practical advantages of association to all classes of society would be as thirty to one, and more in many instances, compared with the present state of things. To master his whole theory of universal science would, we are told, require more time and mental application than the study of all the branches of mathematics.

In November 1822, Fourier's two large volumes were completed, and he went to Paris to have them advertised, reviewed, and sold if possible. Here he was disappointed. Few of the reviewers noticed his work, and those who mentioned it said little more than that it was a voluminous and abstruse production. After waiting twelve months to have his book reviewed, without obtaining any notice from the press beyond the mere mention of "voluminous abstruseness," Fourier published a summary of some one hundred and fifty pages, in the hope of obtaining a more favourable and detailed review. Here again he was disappointed. He sent his work to many of the leading statesmen of the time, but those who were polite enough to acknowledge the present, alleged their multifarious occupations as a reason for not having time to read the book. Unable to continue the expensive residence of Paris, Fourier returned to Lyon in the month of March 1825, where his necessities compelled him to accept the office of cashier in a commercial house, at a salary of 1200*fr.* a year. In the meantime his book had been read by some inquiring minds in various parts of the country, and a few influential persons became professed disciples. In the summer of 1825, M. Grea, a gentleman of large property, invited Fourier to his country residence at the château of Roturier, near Lons-le-Saulnier, where he was anxious that Fourier should remain and write a more elementary work for general readers. Fourier complied with the request, and commenced his compendium, but did not then complete it. He returned to Lyon for a short time, and in January 1826 to Paris, where he remained nearly two years. In July 1828 he went again to Besançon to print the compendium to his theory;

which was published early in 1820, under the title of 'The New Industrial World,' a large octavo volume of 600 pages, and the most methodical and elementary of all his works. In this volume he has devoted a long and elaborate chapter to the 'Confirmation of Associative Principles from the Gospel.' From 1822 he appears to have studied the Sacred Scriptures with devout attention, and to have altered his mind with regard to the influence of their authority in corroboration of his science.

During the time of his last visit to Besançon, his native city, to superintend the printing of his 'New Industrial World,' he resided in the house of a lady, Madame Clarissa Vigoureux, who had recently become a convert to his views, and who subsequently devoted her whole fortune, as well as her talents, to the propagation of his theory: her 'Paroles de Providence' was one of the most popular works published in elucidation of Fourier's theories.

In March 1820 Fourier returned to Paris, where he continued to reside permanently. His compendium was treated by the press with the same indifference and silence as the larger work of 1822, and his name remained unknown to the public until the year of the Revolution, 1830, when the St. Simonians in Paris began to attract general attention by their eloquence and eccentricity. As this new sect professed to take an interest in social industry and combinative unity, Fourier sent a copy of his works to each of their leaders, offering to assist them in organising practical associations, if they were willing to avail themselves of his theory. He had made the same offer to the English Socialists some years before, but his offer of assistance was treated with polite indifference by both the English and the French sects of social innovators. This treatment soured Fourier's mind against both parties, and he resolved to publish a critical refutation of their respective systems. In 1831 he published a pamphlet entitled 'The Fallacy and Charlatanism of the St. Simonians and the Owenites.' This pamphlet contains a very severe criticism of the two systems, and was probably a powerful agent in neutralising the influence of the St. Simonians in France. Most of Fourier's writings display an irritable temper, but this pamphlet is lamentably deficient in equanimity, however just the arguments may be. It produced however a great sensation amongst the St. Simonians, and several of their leaders openly embraced Fourier's views.

This was the beginning of Fourier's notoriety and influence in Paris. Men of talent and of property began to group themselves around him in numbers, and in 1832 they were able to afford him the means of publishing a weekly journal, the first number of which appeared on the 1st of June 1832, under the name of 'The Phalanstery,' a journal of industrial reform. Fourier edited this journal with the aid of several of his new adepts, who had left the St. Simonians. Many of his articles are interesting, inasmuch as they are less abstruse and scientific than his books. The journal was continued for two years, and laid the foundation of that 'Phalansterian Propaganda' which afterwards became widely spread over all parts of the globe.

The gentlemen who enabled Fourier to commence this journal, enabled him also to form a joint-stock society for the practical experiment of his theory. Shares were taken to the amount of 20,000*l.*, and an estate of 1200 or 1300 acres of waste land was purchased at Condé-sur-Veget, near Rambouillet. Buildings were commenced and other operations, almost immediately, against Fourier's will, before a sufficient number of shares had been sold to warrant such precipitancy: it failed, as all such experiments have hitherto failed. In the first instance it was stopped short for want of sufficient capital; then passing into other hands it soon lost its distinctive character, and eventually was wholly abandoned as an associative scheme.

In 1835 Fourier published another octavo volume, entitled 'False Industry,' but it was chiefly filled with criticisms of the present state of things, and contained nothing new in regard to his theory. In 1836 a monthly journal was commenced by his friends, under the name of 'La Phalange,' which had a larger and more vigorous existence than its predecessor. As the 'Démocrate Pacifique,' it eventually appeared as a daily paper, but the revolution put an end to its existence, and sent its editors into exile.

Fourier was a man of dignified simplicity, friendly and polite, indulgent and sincere, but somewhat misanthropic in the latter part of his life, partly from disappointment in failing to realise his theory during his own lifetime. In person he was slight, and of a nervous, irritable temperament: his stature about five feet seven inches. His physiognomy was expressive, his hair light-brown, complexion fair; his eyes blue and of a mild expression. His nose was aquiline and thin large, his lips thin and much compressed. His head was of the 'Gaulois' form, less oval than the Celtic, prominent in front, depressed behind, and very full on each side, and yet rather small than large. In youth his favourite study was geography; his favourite amusements were music and the cultivation of flowers.

In 1837 Fourier's health began to decline rapidly, and on the 10th of October he died, leaving a second volume of his 'False Industry,' partly printed, but not published. The whole of his published works consist of—'Théorie des Quatre Mouvements et des Destinées Générales,' 1 vol. 8vo, 420 pages, published in 1808; 'Traité de l'Association Domestique Agricole,' 2 vols. 8vo, published in 1822, and a summary of the same, published in 1823, making altogether a work of 1448 closely printed pages; 'Le Nouveau Monde, Industriel et Socié-

taire,' 1 vol. 8vo, published in 1820, with a livret d'annonce of the same, published in 1830, 664 pages; 'Pièces et Charlatanisme des deux Sectes St. Simon et Owen,' an octavo pamphlet of 72 pages, published in 1831; 'La Fausse Industrie, morcelée, repugnante, mensongère; et l'Antidote, l'Industrie naturelle, combinée, attrayante, véridique, donnant quadruple Produit,' 1 vol. 8vo, published in two parts, the first in 1835, the second in 1837, 840 pages; and the 'Passions of the Soul,' mentioned above, which has been translated into English (8vo, 1851) by the Rev. J. R. Morell, with a biography and general introduction by Hugh Doberty. Eight volumes of his 'Œuvres Complètes' were published at Paris between 1841-45.

Fourier's views have unquestionably had a very powerful influence in modifying, if not in forming, those associative, communistic, or socialistic doctrines which were for awhile dominant, and though repressed are yet influential, and appear to have taken deep root in France; have extended so widely throughout the European continent; and have been far from inoperative in this country and in America; though, as it would seem, their prevalence is less general and their influence less profound than the hopes and fears of their more ardent advocates and opponents have led them to believe. We therefore deem it not unadvisable to place before our readers a summary of the views of Fourier, drawn up, as will be seen, by a member of the Phalansterian school, one of Fourier's most devoted and able disciples—holding ourselves of course therefore free from all responsibility for the tone of acquiescence in opinions many of which we deem palpably erroneous.

Fourier's theory is based on One universal principle—that of attraction and repulsion, in all spheres of life and movement. The cardinal division of this One principle or law of movement pivots on, or terminates in, what he terms *Passional* or *Social* harmony. When stated mathematically his science resolves itself into three theorems—three aspects of universality—which are these:—

Les attractions sont proportionnelles aux destinées.
La Série distribue les harmonies.
Analogie universelle.

These are accepted by the Phalansterian school as fundamental axioms of science, and susceptible of demonstration; and all that Fourier has been able to demonstrate with them is admitted.

There can be no doubt that one principle of unity governs all the infinite varieties of nature, and that these varieties must therefore correspond to one another in some degree of close or of remote analogy as well as to the One principle in which they all unite; and hence the evident necessity of Universal analogy as a connecting link in nature, and a ladder for the human mind to climb upon in rising to the infinitely great, or in descending to the infinitely small in creation.

That order is heaven's first law, the law of universal harmony in fact, there cannot be a doubt in healthy minds; and that variety is harmonised in unitary order, by the law of series or gradation, is self-evident, and hence the truth of Fourier's second theorem. The application of this law however is infallible in superhuman wisdom only, not in fallible humanity; and hence it is that Fourier's school accept the law of order or series, as he explains it scientifically, but reserve their free assent in cases where a special application of this law is not sufficiently supported by experience or scientific demonstration.

That the general impulsions of created beings are adapted to the ends for which they are created, is a theorem which cannot be denied without imputing imperfection to the author of our being; and hence the first theorem of Fourier, that attractions are proportional to final destinies.

From this he argues that the affections and desires of human nature for individual and social happiness, are permanent impulsions destined to seek, and ultimately to find, the laws of their harmonious satisfaction. He also argues that these innate aspirations are eternal, and that they cannot be eradicated from the soul, but that they may be, and too often are, corrupted by temptation, instead of being developed in harmonious discipline. Whence he concludes that the disciplines of life for every age and occupation, or the institutions of society in moral and religious and industrial education, government and progress, are alone within the power of man to alter and improve, as a medium of due development for those impulsions which God has implanted in human nature, and over which man has no control but that of discipline, which may be good or bad, general or partial, and which may influence the destiny of human souls for good or evil, though it cannot alter human nature.

Fourier's whole life was devoted to this problem of social disciplines in every sphere of life, but particularly in the sphere of social industry. Whether his solution of the problem be complete or not, it can hardly be denied that he has thrown considerable light on many questions of the highest moment to the present and the future welfare of mankind.

The general tone of his mind may be gathered from his answer to an allegation of scepticism made in the 'Gazette of France,' two years before his death. He states that "there are two doctrines which he could not deny without denying his own: the doctrine of Christ in religion, that of Newton in science." Religious and political discussions are carefully avoided in all Fourier's writings. He professes not to meddle either with the throne or the altar. He establishes a 'School of Science,' but denies that he has any wish to form a new religion.

He proclaims himself a Christian. Theology as well as politics he deems a proper subject for discussion, but not Revelation. He differs from philosophers and divines on many points of natural and scriptural interpretation, but he never doubts of Revelation in the Word and in the works of God. If we have understood him rightly in his views of future unity in Christian faith, he believes the Roman Catholic religion will be universally adopted, when its oecumenical councils have been re-established, and the principles of love and charity regain as much ascendancy as will admit of private liberty and toleration of opinion in the Church. The unity of Roman Catholic devotion will then harmonise the liberty of Protestant opinion, as the solar light includes the various coloured rays without destroying them in one refulgently-impartial colour, White. Doctrinal variety and pure devotional unity appear to be the Phalansterian view of Christian harmony.

After Fourier's death, the progress of his theory was rapid in almost all parts of the civilised world, but more especially in France and North America. In both countries associations were formed for the purpose of carrying out Fourier's theory of domestic and agricultural association, and two men of great literary ability and mental energy, M. V. Considérant and Mr. Albert Brisbane, devoted themselves to the task of popularising his opinions. But in France Fourierism was beaten down with all other phases of socialism by the reactionary movements which followed the revolution of 1848, and in America the doctrine appears to exhibit little more vitality. In England, where Mr. Hugh Doherty has made himself the representative of Phalansterianism, the name is only known outside the small 'phalanx' to those who take a more than common interest in those mental manifestations which, in a silent and unobserved way, appear to be acting upon public opinion. In Germany, Italy, and Spain, and also in Belgium and Holland, the Phalansterians assert that their system has numerous converts, and there appear to be reasons for believing that some such form of doctrine has a very large number of secret adherents in most, if not all of those countries, but how far it is Fourierism, or a ruder and coarser form of socialism, is by no means easy to say.

FOURIER, JOSEPH, was born at Auxerre in 1768. He was the son of a tailor in that town, and there received his education at a school directed by the Benedictines. Into this order he was about to enter, and had passed a part of his noviciate, when the Revolution commenced. He had applied himself very early to the mathematics, and had gained such reputation that in 1789 he was appointed professor in the school at which he had formerly studied. He had not confined himself to one branch of learning, as appears from his giving courses of history, rhetoric, and philosophy. Before this time, in 1787, he had sent to Paris a memoir on the theory of equations, to be presented to the Academy of Sciences. This memoir contained the first steps of the theory which was afterwards published: it was lost during the Revolution, but a sufficiently attested copy exists.

Fourier took some part in the civil troubles, at their commencement, and was a member of the Committee of Public Safety at Auxerre. He was more than once the object of proscription, having been twice either saved or delivered from prison by his fellow-townsmen of Auxerre, once saved from the guillotine by the death of Robespierre, and once by the interference of the professors of the Ecole Polytechnique. Having previously been a pupil of the Ecole Normale, he was appointed a sub-professor of the Polytechnic School in 1794, and remained in that post till 1798. In the latter year Monge proposed to him to accompany the expedition to Egypt. His occupations in that country were various: he was secretary of the Institute which was formed at Cairo; he superintended the commission which was employed in collecting materials for the great work on Egypt, and was employed in judicial and diplomatic capacities. At his return from Egypt he was appointed by the First Consul prefect of the department of Isère, which place he continued to fill till 1815, his situation having been preserved to him at the fall of Napoleon in 1814, by the high estimation in which he was held, and the gratitude of those adherents of the old monarchy whom he had served. When Napoleon I. in 1815 passed through Grenoble (a town of Fourier's prefecture), Fourier, who had hesitated much, issued a moderate Bourbonist proclamation, and left the town by one gate as Napoleon entered it by another. Napoleon was extremely enraged at this step, and causing Fourier to be brought into his presence, reminded him in strong terms of former benefits, and telling him that, after the proclamation, he could not remain at Grenoble, appointed him prefect of the department of the Rhône. Fourier appears to have been softened by the matter, or subdued by the manner, of Napoleon's address to him, and went quietly to his new post. He resigned it however on the 1st of May, in consequence of his determination not to execute the orders of Carnot, which required him to make numerous arrests among the Bourbonites; and he was in Paris when the news of the battle of Waterloo arrived. Here he remained for some time, entirely neglected, and with very moderate funds, until his former pupil, M. de Chabrol, gave him the superintendence of a 'bureau de statistique.' In 1816 he was chosen a member of the Institute, but Louis XVIII. refused to ratify the election; and it was not till a year after that this king could be induced to allow it. On the death of Delambre he was chosen secretary of the Academy, and on that of Laplace president of the council of the Polytechnic School. Fourier died at Paris in May 1830.

The character of Fourier was in every point of view respectable. His appearance and manners were decidedly good, and his address, united with the respect which he created, enabled him to manage the prejudices and passions of others to a remarkable extent, of which M. Cousin, in his notes to his *éloge* of Fourier, gives several instances. He knew how, says M. Cousin, "prendre chacun par où il était prenable;" and his own explanation of this faculty was "je prends l'épi dans son sens, au lieu de le prendre à rebours." The influence of his conversation produced in one case at least abiding and remarkable effects: it was he who first gave a taste for Egyptian antiquities to the Champollions.

The writings of Fourier consist of papers in the 'Memoirs' of the Academy of Sciences, the 'Annales de Physique,' and the 'Recherches Statistiques sur la Ville de Paris,' &c., as well as of two separate works, namely, the 'Théorie de la Chaleur,' Paris, 1822, and the 'Analyse des Equations déterminées,' Paris, 1831. The last work is posthumous, and was completed under the inspection of M. Navier.

In the first of the two works, the object of which is the deduction of the mathematical laws of the propagation of heat through solids, Fourier extended the solution of partial differential equations, gave some remarkable views on the solution of equations with an infinite number of terms, expressed the particular value of a function by means of a definite integral containing its general value (which is called 'Fourier's Theorem'), &c. This work is full of interesting details, and is one of the highest productions of analysis of our day.

The latter of the two works contains an extension of Descartes' well-known rule of signs, by means of which the number of the real roots of an equation may be determined. Considered with respect to results merely, the method of Fourier may perhaps be considered as superseded by the remarkable theorem of M. Sturm; but there is nevertheless much in the course marked out by Fourier which it would be worth while to examine. The work also contains a method of solving equations by determination of the successive figures of the root, analogous to that proposed by Mr. Horner and others. The preface of M. Navier contains attestations as to the time at which the several parts of the work were written, which it will be worth the while of those to consult who think that "all which has been done by Fourier was virtually done by Mr. Horner long before."

FOURMONT, ETIENNE, born at Herbelay, near Paris, in 1683, was the son of a surgeon: he studied in several colleges at Paris, and showed an early and extraordinary facility for learning languages. He made himself master of the Latin, Greek, Hebrew, Syriac, and Arabic, and was appointed professor of the last-mentioned language in the College Royal of Paris. In 1715 he was made a member of the Academy of Inscriptions and Belles-Lettres, and afterwards of the royal societies of London and Berlin. A young Chinese named Hoan-ji having been brought to Paris by the missionaries, Fourmont was appointed to assist and direct him in the compilation of a Chinese grammar and dictionary. After a few years Hoan-ji died, and left to Fourmont only very scanty materials for the intended work. Fourmont prosecuted the labour alone, and after several years he published his 'Meditationes Sinicæ,' 1737, which contain a kind of introduction to the Chinese grammar. Five years later he brought forth the grammar itself, which had cost him twenty years of study: 'Lingue Sinarum Mandarinicæ Grammatica duplex, Latine et cum Characteribus Sinensium,' fol., 1742. Fourmont availed himself of the suggestions of several Jesuits, and he is said to have borrowed from Father Varo's 'Arte de la Lengua Mandarinica,' printed at Canton in 1703, which was little known in Europe. He also compiled a catalogue of the Chinese manuscripts in the king's library at Paris. Peter the Great having forwarded to the Academy of Inscriptions some fragments of a Tibetan manuscript found by the Russian soldiers, Fourmont deciphered it, and his version is given in Boyer's 'Museum Sinicum.' His 'Reflexions sur l'Origine, l'Histoire, et la Succession des Anciens Peuples, Chaldéens, Hébreux, Phéniciens, Egyptiens, Grecs, &c., jusqu'au tems de Cyrus,' were published after his death in 2 vols., 4to, Paris, 1747, with a biographical notice of the author. He wrote numerous other works, dissertations, memoirs, some of which appeared in the 'Memoirs of the Academy,' others were published separately, and many he left in manuscript. He published himself a catalogue of all his works in 1731, which then amounted to about 120, but many of them were mere unfinished sketches. Fourmont was not extremely modest, and was fond of speaking in praise of his own erudition, which was undoubtedly very extensive. He died at Paris, in December 1745.

FOURMONT, MICHEL, younger brother of Etienne, born in 1690, exhibited also a facility for learning languages: he assisted his brother in his philological labours, was made professor of Syriac in the College Royal in 1720, and he gave also from his chair lectures on the Ethiopic language. In 1726, being sent by the government to Greece to purchase manuscripts and copy inscriptions, he gathered a rich harvest of both. He boasted of having copied more than 1000 inscriptions, chiefly in Attica and the Peloponnesus, which had escaped the researches of Spon and Wheeler and other travellers. These copies were deposited in the Royal Library at Paris. Many of these inscriptions are authentic, but others are forgeries, although Raoul Rochette ('Lettres sur l'Authenticité des Inscriptions de Fourmont,' Paris, 1818) defends their authenticity. In his letters to Freret and Count Maurepas,

Fourmont boasts of having defaced or destroyed the remains of antiquity of several cities of Greece, and among others those of the temple of Jupiter at Amyclæ—a boast as unmanly as it is false, or at least absurdly exaggerated. (Dodwell, 'Tour through Greece,' vol. ii. ch. 11.) He died in 1746, having published only some detached papers in the 'Memoirs of the Academy of Inscriptions,' of which he was a member.

CLAUDE LOUIS FOURMONT, his nephew, who had accompanied him to Greece, returned to the Levant, and remained several years in Egypt. On his return to France he published a 'Description historique et géographique des Plaines d'Héliopolis et de Memphis,' 12mo, 1755. It is a sensible, unpretending little work, and gives a satisfactory account of the condition of Egypt at that time. Claude Fourmont died in 1780.

* FOWLER, CHARLES, architect, was born at Collumpton, Devonshire, on the 17th of May 1792, and was educated at the grammar-school at Taunton. In 1807 he was articled to an architect and builder at Exeter, and in 1814 he came to London. He entered the office of the late Mr. Laing [LAING, DAVID], where he remained four years, during the building of the Custom-House. In practice for himself, one of his first works was the building of the Courts of Bankruptcy in Basinghall-street, erected about the year 1821. He was successful in several competitions, amongst the number one for the new London Bridge, having the first premium of 250*l.* awarded to him for his design by the three architects of the Board of Works. This was about the year 1823. A design by the late Mr. Rennie was afterwards carried out, mainly under the direction of the present Sir John Rennie. Amongst Mr. Fowler's chief works are buildings for markets. He designed and superintended the market at Gravesend, and in 1824 formed the scheme and prepared designs for the building of Hungerford Market, and improvements connected with it. This scheme was carried into effect by a company in 1835. During the period from 1826 to 1831 he designed and erected Covent-Garden Market for the late Duke of Bedford, and in 1835 the corn-market at Tavistock. Amongst his other works have been the grand conservatory at Syon House, 1827 to 1830; the bridge over the Dart at Totnes, 1827, where he carried out the principles of construction which he had proposed for London Bridge, under analogous circumstances; the Devon Lunatic Asylum, 1843-45, and works at Powderham Castle; several churches, and the London Fever Hospital, in 1848-49; and the hall of the Wax-Chandlers' Company in Gresham-street in 1853. Since 1852 Mr. Fowler has been compelled by ill-health to reside chiefly in the country, and consequently has been only occasionally occupied in professional pursuits. During the course of his practice he has made many ingenious and novel appliances in construction, and the system of terrace-roofs which he adopted in the taverns at Hungerford Market has been a subject of interest to French architects. Mr. Fowler was actively engaged as one of the original promoters of the Royal Institute of British Architects, to which for about seven years he was one of the secretaries, and afterwards twice vice-president.

FOX, CHARLES JAMES, was born on the 24th of January 1749. He was the third son of the Right Hon. Henry Fox, who in 1763 was created Lord Holland, and of Lady Georgiana Carolina, the eldest daughter of Charles, second duke of Richmond.

Having commenced his education in a preparatory school at Wandsworth, Fox was sent at the age of nine to Eton. Here his progress was very rapid: and while he thus early gave unequivocal indications of the powers of mind which afterwards yielded so rich a harvest, he was not less distinguished among his school companions for that warmth of feeling and amiability of character which through life served to make men his friends and keep them so. His education was interrupted before he was fifteen by a three months' trip to Paris and to Spa, in which he was accompanied by his father; and the interruption is of more consequence than otherwise it could have been, if it be true, as is represented, that to the misplaced indulgence of the father during this tour is to be traced the devotion to the gaming-table which ever after was the principal alloy of Fox's happiness. "He had left school a boy," says Mr. Allen, in his biographical sketch in the 'Encyclopædia Britannica'; "he returned to it with all the follies and fopperies of a young man." He continued at Eton but one year longer, and in the autumn of 1764 entered at Hertford College, Oxford. Here, as during the latter part of his course at Eton, learning and pleasure were his pursuits in turn. He left Oxford in the autumn of 1766. He then went abroad, and having passed two years chiefly in Italy, returned to England in August 1768. In his absence, and before he was yet of age, he had been elected member of parliament for Midhurst.

Fox took his seat in parliament as a supporter of the Duke of Grafton's ministry. His father, who had entered public life under the auspices of Sir Robert Walpole, had in the progress of time become estranged from the Whig party; and it was from the opinions of the father, at this period in favour of the court, and of an administration whose strength was in the court, that the beginning of Fox's political career derived its character. Fox made his first speech on the 15th of April 1769, on the subject of the famous Middlesex election, supporting the decision in favour of Colonel Luttrell and against Mr. Wilkes. In February 1770, when the Duke of Grafton was succeeded by Lord North as premier, Fox was appointed a junior lord of the Admiralty. He resigned this situation two years after in consequence

of some misunderstanding with Lord North, but in less than twelve months he was brought back into the ministry, being appointed in January 1773 one of the lords of the Treasury. In February of the next year he was again dismissed from his situation, and that somewhat unceremoniously. The immediate cause of the dismissal was the following:—A motion had been made in the House of Commons that Mr. Woodfall, the printer of the 'Public Advertiser,' be taken into the custody of the serjeant-at-arms, in consequence of some remarks on the Speaker which had appeared in that newspaper; when Fox, thinking this punishment insufficient, without consulting Lord North moved an amendment to the effect that Mr. Woodfall be committed to Newgate. Lord North, being compelled, or thinking himself compelled, to support the amendment against the original motion, was left in a minority on a division. There had previously been some coolness between Fox and the premier. The defeat which Lord North considered had been brought upon him by an act of insolent temerity on the part of Fox did not of course tend to diminish it; and a few days after, as Fox was sitting in the House of Commons on the ministerial bench, he received from the hands of one of the door-keepers the following laconic note:—"Sir,—His Majesty has thought proper to order a new commission of the Treasury to be made out, in which I do not perceive your name. North." In a very short time Fox was in opposition.

Fox had not while a ministerialist by any means concurred on all occasions in the opinions of his colleagues; nor, when he differed, had he abstained from expressing and acting upon his own. When he retired from office in 1772, one chief reason for the step was his opposition to the Royal Marriage Act, which was introduced that year by the ministry. Afterwards, in 1773, when he was again in office, he not only spoke, but voted against his colleagues, in favour of a motion by Sir William Meredith for a committee of the whole house to consider the propriety of subscription to the Thirty-nine Articles. He went even so far as to be one of the tellers for the minority on this occasion. It must be added, to the credit of Fox, that the question of American taxation, on which, and on the measures arising out of which, he violently opposed Lord North's administration, was never once brought under discussion during the time that he himself formed a part of it. Again, he had formed, since the time of his entrance into public life, an intimate friendship with Edmund Burke; and if the influence exercised over him by this distinguished statesman—an influence to whose strength Fox frequently testified in after days, when their paths were dissevered, and a cloud had settled upon their friendship—contributed at all to bring about the change which now took place in Fox's political position, neither is this surely any ground for reproach. Burke's conversation doubtless, as well as his speeches and writings, assisted to open Fox's eyes to the evils of that system of court intrigue and domination to which for awhile, in a subordinate part, he had allowed himself to be subjected, and from which evils he had now smarted in his own person; and still more, there can be little doubt as to the mischievous tendency of the ministerial measures respecting the American colonies. It should be borne in mind also, in considering this portion of his history, that his father, who was mainly instrumental in connecting Fox with the ministry, died in the summer of 1774; and this event would most probably have removed many scruples that hitherto might have served to restrain Fox from entering the ranks of opposition.

On the 23rd of March 1774, the House went into committee on Lord North's Boston Port Bill, the object of which was to deprive that harbour of its privileges in consequence of the opposition made by the inhabitants of Boston to the tea duty. This was the first occasion on which Fox opposed the minister. But from this time forward he was unrelenting in his opposition. He took his stand first on the principle that the American colonies ought not to be taxed without being represented; and secondly, on the inexpediency of endeavouring to wring taxes from them by force and at the risk of rebellion. Thus condemning the war in which Lord North involved the nation as unjust and inexpedient, he also took many opportunities to censure strongly the manner in which it was carried on. He denounced the heavy expenditure which ministers, in prosecution of a war unjust, inexpedient, and little likely to be successful, were recklessly entailing upon the nation; and when he saw no prospect of their desisting from the war, he zealously sought, in conjunction with his party, to effect by other means a diminution of the public burdens. In the beginning of 1780 Burke brought forward his plan of economical reform, which was zealously supported by Fox. After having passed through its earlier stages, it was ultimately rejected. But the people had now come to feel the weight of their burdens and to speak out. Petitions poured in from all parts of the kingdom for a reduction of the public expenditure; and on the 6th of April resolutions were carried against the influence of the crown and in favour of an inquiry into the expenditure of the country and of a diminution thereof. A concurrence of favourable circumstances enabled the minister to stand up against this vote, and to recover his once lost majority. But even a dissolution of the parliament, which took place shortly after, enabled him to gain only a short respite. On the 22nd of February 1782, a motion of General Conway's for an address to the crown against a continuance of the war was lost only by one vote; and when revived under a somewhat different form five days after

was carried by a majority of 19. On the 19th of March, the ministers having shown for a short time a disposition still to cling to office, resigned their situations.

It is needless to say how much Fox's exertions had contributed to this result. He had indeed risen by this time to be considered the leading member of opposition, and to be more than any other member of his party, "conspicuous in the nation's eye." At the last general election, in the autumn of 1780, he had been solicited to stand for Westminster, and had been returned in the teeth of every court effort and every trick of private intrigue and intimidation. On the formation of the new ministry under Lord Rockingham, Fox was appointed secretary of state for foreign affairs. He immediately set about negotiations for peace. For this purpose he instructed Mr. Grenville, the plenipotentiary at Paris, to propose in the outset the independence of the United States of America, not making it a condition of a general treaty. This he did in pursuance of a resolution which, upon his recommendation, had been passed in the cabinet, and to which the king's assent had been obtained. But Lord Shelburne, who had been introduced by the king into the ministry, and between whom and Lord Rockingham's friends there was no cordial co-operation, insisted that the offer of recognition of independence was a conditional one; and, after Lord Rockingham's illness had rendered him unable to attend the deliberations of the cabinet, Lord Shelburne succeeded in getting a majority to concur in this view. He was afterwards discovered by Fox to be carrying on a communication with Dr. Franklin. Fox now made up his mind to resign. Upon the death of Lord Rockingham, which took place in July, but four months after the formation of the ministry, Fox and his friends proposed the Duke of Portland to the king as Lord Rockingham's successor, and upon the recommendation not being acceded to, resigned; and the same course was then taken by other friends of Lord Rockingham, by Lord John Cavendish, the Duke of Portland, and Lord Keppel. The Rockingham ministry was fast breaking up when the king completed the wreck by appointing Lord Shelburne lord treasurer.

The Shelburne ministry, though, as regards its mode of formation, it was but a modification of the old one, was yet essentially different in character. Mr. Pitt, who had entered parliament on the occasion of the general election in 1780, and who, during the short time that he had had a seat, had fought by the side of Fox against the American war and in favour of parliamentary reform, accepted the office of chancellor of the exchequer in the new ministry. Other vacant offices were filled up by old supporters of the war which Mr. Pitt had opposed, men who had held subordinate places in Lord North's administration. Lord North was himself excluded from the new arrangements. Hence it came to pass that Fox and Lord North, who for the last eight years had been violent antagonists, were found by one another's side in opposition; and that after a time, the great question of peace or war with America, which had formerly divided them having been settled, the similarity of their political positions brought about a coalition. That coalition called forth at the time, and has called forth since, much disapprobation. It may have been ill-judged; and the result indeed showed that the parties had not formed a correct estimate of the public opinion, which was an important element in the problem to be solved. But there was certainly no dishonesty in the transaction. The question being now no longer whether there was to be peace or war with America, but in what way peace was to be brought about, the two parties in opposition united to pass a vote of censure on the terms of peace proposed by the ministers. This was in February 1783. The ministers, unable to obtain the king's consent to a dissolution, resigned; and after some difficulties a ministry was formed on the 2nd of April, of which the Duke of Portland was premier, and Lord North and Fox secretaries of state. This again was a short-lived administration; and, like that of Lord Rockingham, it fell by the influence of court intrigue. The principal measure which it attempted was that known by the name of Fox's East India Bill, which went to vest the government of the East Indies in a board consisting of seven members, who were to be appointed, the first time by parliament, but always afterwards by the crown, for a period either of three or five years. The objections to the bill were principally of two kinds, "violation of charter" (to adopt Mr. Fox's own mode of putting them) "and increase of influence of the crown;" but there were others again who denounced it as tending to diminish the influence of the crown for the aggrandisement of the ministers, and who opposed it upon this ground. Such was the view adopted by George III. himself. Accordingly, when the bill had passed through the Commons, and came on for the second reading in the Lords, the king sent a message, through Lord Temple, to all noblemen to whom his personal influence extended, that he should consider those who voted for the bill not only not his friends, but his enemies. The ministers were consequently left in a minority. The next day they were dismissed; and the ministry which had been formed in April ended its career in December of the same year. A new ministry was formed almost immediately under Mr. Pitt.

The new ministers very soon found themselves in a minority in the House of Commons. Two resolutions, one for preventing the payment of any public money from the treasury, exchequer, or bank of England, in case of a prorogation or dissolution, unless the supplies

should be previously appropriated by act of parliament; and the other, postponing the Mutiny Bill, were moved by Fox and carried by a considerable majority. The object of these resolutions was to render an immediate dissolution impracticable. Resolutions against the ministers and against the mode of their appointment, together with addresses to the crown for their dismissal, followed. But the majority against ministers, which at first had been formidable, fast dwindled down; and after the king had twice refused his assent to their dismissal, he dissolved the parliament. The last effort of the opposition had been the carrying of a representation to the crown, which, written by Fox, pointed out at length the evils of an administration that was at variance with a majority of the representatives of the people.

Fox was again elected for Westminster; but Sir Cecil Wray, the unsuccessful candidate, having demanded a scrutiny, the high bailiff took upon himself to make no return of representatives for this city. Fox was in consequence compelled to appear in parliament as member for a Scotch borough; but the conduct of the high bailiff was one of the first matters brought before the House on its meeting. The Westminster scrutiny was one of the chief questions agitated for some time. Mr. Pitt and his friends did all that party animosity could suggest to prevent, or at any rate to delay, the announcement of Fox's election for Westminster; and it was not until after a struggle of a year's duration that the scrutiny was stopped and the return ordered to be made. In the beginning of the subsequent year, 1786, the question of Mr. Hastings's Indian Administration was first brought forward by Mr. Burke; but the trial did not begin before 1788. From the commencement to the close of this affair, in all the preliminary discussions, in the preparation of the articles of charge, and in the managing of the impeachment, Fox took a very active part. Towards the end of the year 1788 the king's illness rendered it necessary to resort to a regency. Fox now violently opposed the course proposed to be taken by Mr. Pitt; and while the latter contended that it was for the two houses of parliament to appoint the regent, Fox maintained that the regency belonged of right to the Prince of Wales. Holding this opinion, he opposed a motion made in the first instance by the minister for a committee to inquire into precedents, and subsequently a bill tending to limit the powers of the regent. It so happened that the king's speedy recovery rendered it unnecessary to bring the regency question to a conclusion; but it is clear that the ground taken up by Fox upon this occasion was even less tenable than that taken up by the minister. The case which now came before parliament was a new and unforeseen case, a case unprovided for by the constitution. There was consequently no right in the matter; there was neither a right attaching to the lords and commons, as was maintained by Mr. Pitt, nor a right attaching to the Prince of Wales, as was contended by Mr. Fox. The question to be decided was which of two courses was the more expedient, not which was the legal one.

In the session of 1789 Fox distinguished himself by the support of a motion for the repeal of the Test and Corporation Acts. A year after he himself brought forward a motion for the same purpose. On the dissolution of parliament in 1790 he was again returned for Westminster, and at the head of the poll. On the meeting of the new parliament an attempt was made to get rid of the impeachment of Mr. Hastings, on the ground that it had abated by the dissolution, and that the new House of Commons could not proceed with what had been begun by the old one. Fox made a powerful speech in opposition to this view; he had on this occasion the support of Mr. Pitt, and it was carried against the lawyers by a large majority.

The discussions arising out of the question of the French Revolution, replete as they are with public interest, are also important in a life of Fox, on account of their having led to a termination not merely of his political alliance, but also of his friendship with Mr. Burke. The difference of their opinions on that great question had been shown so early as in February 1790, during a discussion on the army estimates. At this time however, each spoke of the other in terms of kindness and regard. But it was not always thus. When on the 6th of May 1791, the Quebec Government Bill, or Bill for regulating the government of Upper and Lower Canada, came under discussion, Mr. Burke rose and was proceeding to deliver a violent diatribe against the French Revolution, when, after he had been several times ineffectually called to order, it was moved by Lord Sheffield, and seconded by Fox, "that dissertations on the French constitution, and narrations of transactions in France, are not regular nor orderly on the question; that the claims of the Quebec Bill be read a second time." The remarks made by Fox in seconding the motion, though wearing an appearance of candour and even friendliness, were calculated to irritate his former friend; and when Burke rose to reply, he did so under the influence of strong excitement, and complained bitterly that he had not been treated by Fox as one friend should be treated by another. He observed, towards the conclusion of his speech, that it certainly was indiscreet at his time of life to provoke enemies, or give his friends occasion to desert him; yet if his firm and steady adherence to the British constitution placed him in such a dilemma, he would risk all; and, as public duty and public prudence taught him, with his last breath exclaim, "Fly from the French constitution." Fox here whispered that there was no loss of friendship. "Yes, there is,"

exclaimed Burke, "I know the price of my conduct; I have done my duty at the price of my friend: our friendship is at an end." At the conclusion of Mr. Burke's speech, Fox rose, but it was some minutes before his tears allowed him to proceed. So soon as he could speak, he pressed upon Mr. Burke the claims of a friendship of five-and-twenty years' duration, but to no purpose, and the breach was never made whole.

Fox distinguished himself during the same session of 1791 by his opposition to the ministerial project of an armament against Russia, by his support of Mr. Wilberforce's motion for the abolition of the slave-trade, and by the introduction of a bill for the amendment of the law of libel. From the latter part of 1792 to 1797 his efforts were unceasing, first to prevent a war with France, and afterwards, when his warnings had been of no avail, and it had been entered into, to bring it to a close. During this period many of his friends, filled with alarm at the progress of events in France, and their probable influence on their own countrymen, left him to swell the majorities of the minister; and pitiable indeed were the minorities by which Fox's motions, one after the other, were supported; but this in no way daunted him. We must mention also the support which, in 1793, he gave to Mr. (afterwards Earl) Grey's famous motion for parliamentary reform, his eloquent advocacy in 1794 of the cause of Muir and Palmer, the Scottish political martyrs, his indefatigable opposition to the treason and sedition bills of 1795, and his attempt to procure attention to the state of Ireland and to the grievances of Irish Catholics, by a motion made in 1797, as additional important incidents during that period of his career, the principal object of which was opposition to the first French revolutionary war.

On the 26th of May 1797 Mr. Grey made a second motion on the subject of parliamentary reform. Fox took this opportunity of announcing a resolution which he had formed to discontinue his attendance at the house, seeing that he and his friends were destitute of power to carry out their views. It is perhaps a question whether such a step as this can be taken by a member of the legislature without dereliction of duty, even though it may be a means of influencing the public mind, and through it the legislature; and though the consent of the member's special constituents may have been procured thereto. But at the same time it would be unjust to apply to the conduct of individuals acting under a very defective system of representation tests which spring from, and form parts of, a perfect theory. The five years then, from 1797 to 1802, were passed by Fox principally at St. Ann's Hill, in retirement, and in the pursuits of literature. It was during this period of retirement that he formed the project of his 'History of the Reign of James II.' A dissolution of parliament took place in June 1802, and Fox, whose popularity with his constituents had not been a whit diminished by his absenting himself from the house, was again returned for Westminster. Almost immediately after his re-election he paid a visit to Paris, principally for the purpose of collecting documents for his projected historical work. During his stay in Paris it is said that he was treated with marked attention by Napoleon I.

Mr. Pitt had retired from office in March 1801, on finding himself unable to procure the king's assent to the measure of Catholic emancipation; and he had then succeeded by Mr. Addington. The new ministers had almost immediately set about negotiations for peace with France; and when the preliminary articles, signed at London on the 1st of October 1801, had come under discussion in the House of Commons, Fox had emerged from his retirement to express his joy at the prospect now opened of a conclusion of the war, and to give his best support to the ministry. He appeared again in his place on the meeting of the new parliament, in the autumn of 1802, still hoping to contribute to the bringing about of peace, but beginning by this time to doubt the sincerity of the ministers. A message from the crown, in May 1803, announced that the negotiations were broken off. The following year Mr. Addington resigned office, unable to stand against an opposition which included both Fox and Pitt. It was now hoped that Pitt, to whom was intrusted the making of the ministerial arrangements, would be able to avail himself of the services of Fox, by whose side, though not in recognised conjunction, he had been now sitting for some time in opposition. But the king would not hear of Fox being admitted to office. Lord Grenville, Lord Spencer, Mr. Windham, and others, who, like Pitt, had been latterly co-operating with Fox, refused to take any part in an administration from which Fox was excluded; and Pitt was thus compelled to throw himself upon the scattered subordinates of the Addington ministry. Peace came not from this ministry. On the 23rd of January 1806, Pitt's death dissolved it; and in the new ministry which was formed under Lord Grenville, Fox was appointed secretary of state for foreign affairs. His life was spared but for seven months longer; but during this short period he did much towards the abolition of the slave-trade, which had ever been one of the objects that he most cared for, and he entered zealously into negotiations for peace with France, which it was a heavy misfortune to his country that his death did not allow him to complete. He died on the 13th of September 1806, in the fifty-eighth year of his age. The complaint which caused his death was water on the chest.

Such is a brief sketch of the public life of Fox. With the exception of the first six years of it, in which he was either a supporter or a

member of a court administration, it was in substance consistent. From the beginning to the end it was honest. There are parts of his public life certainly which have led others to call his honesty into question, and to deny to him the quality of consistency; and of these parts, or at any rate of some of them, there are those among his friends and admirers who have expressed disapprobation. Such parts are his early connection with the court, his coalition with Lord North, and, shortly before his death, his coalition with Lord Grenville. The charge that he was actuated by private pique when, in 1774, he became an opponent of Lord North's ministry, has been already met, so far as it is possible to meet a charge which it is so very easy to make. But in a case where no unworthy motives have operated to produce a change of course, and it proceeds from change of opinion, it is for a vulgar mind alone to make this a ground of attack and abuse. And equally vulgar is that view of a statesman's duty which would prevent him from ever entering into alliance with one to whom at a previous period he may have been opposed, even though the question or questions on which they differed may now have been settled, and there may only remain questions upon which they are agreed. Fox was assuredly not, in the full and strict sense of the term, a philosophic statesman, yet he came nearer to it perhaps than most other English statesmen of his time. His speeches always display in a pre-eminent degree a sense of the importance of principle. Sir James Mackintosh has said of him, as an orator, that "he possessed above all moderns that union of reason, simplicity, and vehemence which formed the prince of orators. He was the most Demosthenean speaker since the days of Demosthenes." Fox's speeches were collected, and published in six volumes with a short biographical and critical introduction by Lord Erskine, in 1825. The fragment which he left of his projected 'History of the reign of James II.' a feeble and valueless production, was published in 1808, with a preface by Lord Holland. Of the long-talked-of 'Memorials of Charles James Fox,' begun by Lord Holland, Lord John Russell has published three volumes, and announced a fourth to complete the work; but the work, though essential for the history of the period, has been prepared in a very disjointed and unsatisfactory manner.

FOX, GEORGE, founder of the sect of Quakers, an enthusiast, honest, zealous, illiterate, yet of no mean capacity and influence, was born at Drayton, in Leicestershire, in July 1624. His origin and the beginning of his preaching are thus shortly told by Neal ('History of Puritans,' iv. 1):—"His father, being a poor weaver, put him apprentice to a country shoemaker: but having a peculiar turn of mind for religion, he went away from his master, and wandered up and down the countries like an hermit, in a leathern doublet; at length his friends, hearing he was at London, persuaded him to return home, and settle in some regular course of employment; but after he had been some months in the country, he went from his friends a second time in the year 1646, and threw off all further attendance on the public service in the churches. The reasons he gave for his conduct were, because it was revealed to him that a learned education at the university was no qualification for a minister, but that all depended on the anointing of the Spirit; and that God who made the world did not dwell in temples made with hands. In 1647 he travelled into Derbyshire and Nottinghamshire, walking through divers towns and villages, which way soever his mind turned, in a solitary manner. He fasted much, and walked often abroad in retired places, with no other companion but his Bible. He would sometimes sit in a hollow tree all day, and frequently walk about the fields in the night like a man possessed with deep melancholy. Towards the latter end of this year he began first to set up as a teacher of others, the principal argument of his discourse being, that people should receive the inward divine teachings of the Lord, and take that for their rule."

From the beginning of his teaching he discontinued the use of outward marks of respect. He says, in his journal for 1648—"When the Lord sent me forth into the world, he forbid me to put off my hat to any, high or low, and I was required to 'thee' and 'thou' all men and women, without any respect to rich or poor, great or small; and as I travelled up and down, I was not to bid people 'good-morrow' or 'good-evening,' neither might I bow or scrape with my leg to any one: and this made the sects and professions to rage." Nothing probably conduced so much to the virulent persecution of the Quakers as their refusal of such tokens of respect, which persons in office interpreted into wilful contempt, except their conscientious refusal to take any oath, which involved them in the heavy penalties attached to the refusal of the oaths of allegiance and supremacy.

We shall not enter on a detail of his religious tenets, labours, or sufferings: the latter are fully recorded in his 'Journal,' and noticed in most histories. It is necessary however to refer to his doctrine ('Journal,' 1649, p. 26), that "it is not the Scriptures, but the Holy Spirit, by which opinions and religions are to be tried." By this test, each convert might believe himself possessed of a peculiar infallible internal guide; and, in fact, it proved a warrant for any wild fancies which entered the minds of his followers, and led some into extravagances which gave a colour for the cruel treatment which all experienced. (Neal, iv., c. 8.) Into such extravagances Fox himself does not appear to have been often betrayed. From 1646 till within a few years of his death, his life was made up of travel, disputation, and imprisonment. He visited the continent of Europe several times, and

in 1671 made a voyage to our American colonies. Wherever he went he seems to have left permanent traces of his preaching and presence. Quaker meeting-houses were first established in Lancashire and the parts adjacent in 1652, and in 1667 the congregations were organised into one body for purposes of correspondence, charity, and the maintenance of uniform discipline. The term 'Quaker' arose at Derby in 1650, on occasion of Fox being brought before one Justice Bennet, "who was the first that called us 'Quakers,' because I bid them 'Tremble at the Word of the Lord.'" In 1677, and again in 1681, he visited the Netherlands, where his tenets had taken deep root. After his return from the latter journey, his constitution being broken by the labours and hardships of nearly forty years, he desisted from travelling, but continued to preach occasionally in London till within a few days of his death, which took place January 13, 1691.

To Fox, and others among his associates [BARCLAY; PENN], the praise of zeal, patience, self-denial, courage, are amply due; and their sufferings under colour of law are a disgraceful evidence of the tyranny of the government and the intolerance of the people. But there was one point in Fox's early conduct which justly exposed him to censure and punishment—his frequent interruption of divine worship as performed by others. From this practice, in the latter part of his ministry, he seems to have abstained. His moral excellence and the genuineness of his devotion are unquestioned. Fox's writings were for the most part short; they are however very numerous, and in the collective edition fill three volumes folio.

(Fox's *Journal*; Neal, *History of Puritans*; Sewell, *History of Quakers*, &c.)

FOX, JOHN, commonly called the Martyrologist, from the work by which he is principally known, was born at Boston, in Lincolnshire, in 1517, was entered at Brazenose College, Oxford, in 1531, and elected a fellow of Magdalen College in 1543. Before this he had been chiefly distinguished for the cultivation of Latin poetry; but he had lately applied himself with great earnestness to the study of divinity, the result of which was that he became a convert to Protestantism, and on a charge of heresy being brought against him, was deprived of his fellowship in 1546. His father had left him some property, but this was also now withheld from him, on the same ground, by a second husband whom his mother had married, and he was in consequence reduced to great distress. At last he obtained the situation of tutor in the family of Sir Thomas Lucy, of Charlecote, in Warwickshire, the same whose deer-park Shakspeare is accused of robbing. This place however he left after some time, and was again subjected to many disappointments and hardships. At length he was taken into the house of Mary duchess of Richmond, to instruct the children of her brother the Earl of Surrey, who was then confined on the charges for which he soon after suffered death. After the accession of Edward VI. Fox was restored to his fellowship; but he fell again into danger in the time of Mary, in consequence of which he went abroad, and after wandering through different parts of Germany was taken into employment as a corrector of the press by Oporinus, the eminent printer at Basel. On the death of Mary he returned to England, where his former pupil, the eldest son of the unfortunate Earl of Surrey, who was now duke of Norfolk, received him with great kindness, and settled a pension on him for life. A prebend in the church of Canterbury was also given to him by Cecil. Although however he retained this preferment till his death, Fox never would subscribe to the articles of religion as finally settled, and this prevented his ever attaining any higher dignity in the church. He may be considered as having belonged properly to the sect of the Puritans. He died in 1587.

Fox was the author of numerous works, a list of which is given in the 'Biographia Britannica'; but the only one that is now remembered is his 'History of the Acts and Monuments of the Church' (commonly called his 'Book of Martyrs'), which was first printed in one volume folio, in 1553, but was afterwards divided into three volumes, and has been repeatedly reprinted both entire, and in an abridged, modernised, or otherwise mutilated form. The trustworthiness of this great record of the sufferings of the early English reformers has been bitterly assailed by many Roman Catholic writers, and of late years by some writers belonging to the "high church" party. But nothing beyond a few comparatively unimportant mistakes, arising from some degree of credulity, and a natural though exaggerated zeal, seems to be established against it: the veracity and honesty of the venerable author may be affirmed to be quite undamaged. Fox's work has preserved many facts, some of greater, some of less importance, that are nowhere else to be found. It ought also to be noted to the credit of the author, that he showed himself throughout his life, if not a friend to toleration in the largest view, yet a decided enemy to persecution and severity in the suppression of religious errors. In this sentiment he was a considerable way ahead of the general, if may almost be said, the universally prevalent notions of his age. His mind was certainly not a very capacious one, nor had he any pretensions to great depth or accuracy of learning; but for the consistency and excellence of his moral character no man of his time was held in higher regard. Fox was a frequent preacher, as well as a voluminous writer. One of his early performances in Latin poetry, a comedy (as it is called) entitled 'De Christo Triumphante,' has been translated into English by Richard Daye, a son of

BIOG. DIV. VOL. II.

John Daye, the printer, from whose press the first edition of the 'Acts and Monuments' proceeded, and who indeed would seem to have suggested that work. Daye's epitaph on his tombstone in the chancel of the church of Little Bradley-juxta-ThurLOW, Suffolk, says that he—

"Set a Fox to write how martyrs run
By death to life. Fox ventured pains and health
To give them light; Daye spent in print his wealth."
(See Nichols, viii. 580; also 673.)

There is also a French translation of the above-mentioned comedy under the title of 'Le Triomphe de J. C.,' by Jacques Bienvenu, citizen of Geneva, 4to, Geneva, 1662; a very scarce work.

FOX, RICHARD, bishop of Winchester, an eminent statesman, and minister of Henry VII. and VIII., was born of poor parents, towards the middle of the 15th century, at Ropesley, near Grantham, in Lincolnshire, studied at Magdalen College, Oxford, and Pembroke College, Cambridge, and finally went to the University of Paris for his further improvement in divinity and the canon law. There he laid the foundation of his fortunes, by gaining the friendship of Morton, bishop of Ely, a zealous Lancastrian, who had fled from England in 1483 upon the failure of the Duke of Buckingham's insurrection against Richard III. Through Morton's introduction, Fox was taken into the Earl of Richmond's service; and having been of material use in the negotiations with the French court preparatory to the descent upon England, continued to enjoy the earl's confidence after his accession to the throne by the title of Henry VII. He was successively made privy councillor, bishop of Exeter, keeper of the privy seal, secretary of state, bishop of Bath and Wells, Durham, and Winchester, and was frequently employed in important embassies. Indeed no one stood higher in favour, or had more weight with the king, who appointed him one of the executors of his will, and recommended him strongly to the notice and confidence of Henry VIII. He was also executor to Margaret countess of Richmond [BEAUFORT], and in that capacity had a great share in settling the foundation of St. John's College, Cambridge. Henry VIII. no doubt appreciated his talents and integrity, for he continued him in his offices; but the habits of the aged minister, trained to frugality under a most parsimonious master, were ill suited to retain the favour of a young, gay, ostentatious monarch, and he was thrown into the background by the Earl of Surrey, lord treasurer. In hope of supplanting that nobleman by one qualified to win Henry's regard as a companion, yet too humble to aspire to the first place in the state, Fox introduced Wolsey, then his chaplain, to the king's society, in 1513. The result is well known. Wolsey soon engrossed the king's confidence; and in 1515 the bishop of Winchester, disappointed and disgusted, retired to his diocese, and spent the rest of his life in works of munificence and piety, and the discharge of the duties of his office. Corpus College, Oxford, and the free-schools of Grantham and Taunton, in Somersetshire, are of his foundation. He became blind about ten years before his death, which took place September 14, 1528. He was buried in a chapel of his own building, on the south side of the high altar of Winchester cathedral.

*FOX, WILLIAM JOHNSON, M.P., is the son of a small farmer near Wrentham, Suffolk, where he was born in 1786. He was educated for the ministry at Homerton Independent College, but adopted Unitarian opinions, and exercised his ministry at the Unitarian Chapel, Finsbury. At the same time he lent the aid of his pen to the liberal party in politics. He afterwards became a frequent writer and speaker during the agitation for repeal of the Corn Laws. In 1847 he was elected M.P. for Oldham, and though unsuccessful at the general election in 1852, he regained his seat a few months subsequently. He is an able lecturer and political writer. He is the author of a volume on 'Religious Ideas,' 'Lectures to the Working Classes,' of various 'Essays,' and of able contributions to the 'Weekly Dispatch,' and the 'Westminster Review,' with the latter of which he was connected from its first foundation.

FOY, MAXIMILIAN SEBASTIAN, one of the best of the political orators that have appeared in France since the establishment of a constitutional charter, was born in 1775, at Ham, in Picardy. His father, an old military officer, died when Foy was only five years old, and the education of his five children devolved on their mother, Elizabeth Wisbeck, who was a woman of English extraction, and of a superior character. Foy displayed from his earliest boyhood remarkable talents and great application. At fourteen he completed his course of studies at the college of Soissons, after which he passed to the military school of Laferre, and, at the end of 1790, entered the army as a second lieutenant of artillery. He served with great credit in Flanders during the beginning of the war of the revolution. Having however frankly expressed his opinions about the horrors perpetrated at Paris, he was imprisoned at Cambrai, but was released from his confinement by the events of the 9th Thermidor. He now re-entered the army, made two campaigns under Moreau, and rose to the rank of a chef d'escadron, when the treaty of Campo Formio suspended his military career. He took advantage of the short peace which followed that treaty to study public law under the celebrated Professor Koch at Strasburg. In 1798 he again joined the army, and served in Italy, Switzerland, and on the Rhine, till the peace of Amiens, when he returned to France with the rank of colonel. Foy was at Paris during

the trial of Morreau, and he expressed himself against that proceeding with so much animation, that he would have been arrested if he had not left the capital and joined the camp of Utrecht, where he refused to sign a congratulatory address to the first consul on the occasion of his escape from the conspirators' plot. Being a sincere republican, he voted against the election of Bonaparte to the imperial dignity. Notwithstanding that circumstance, Napoleon I. employed Foy, but left him a long time without promotion. In 1807 he was commissioned by Napoleon I. to conduct 1200 French cannoniers to assist Sultan Selim II. against Russia, but the revolution which took place at Constantinople prevented their departure. Foy himself went however to Constantinople, where he assisted the Turks in making dispositions for the defence of the Dardanelles. From Constantinople he went to Portugal, distinguished himself in many battles, received several wounds, rose to the rank of lieutenant-general, and continued to serve during all the Peninsular war, till he received a severe wound at the battle of Orthes. He was employed at the Restoration by the Bourbons, but joined Napoleon after his landing from Elba, and fought bravely at Waterloo, where he was again wounded. From that time he retired from military service, and devoted himself entirely to the study of history, and political and military science, to which he had previously applied all his leisure time. In 1819 Foy was chosen deputy of the department of Ain, and the talents which he displayed in the new career now opened to him surpassed the most sanguine expectations of his friends. His debut in the parliamentary field was an eloquent defence of the rights of his old companions in arms, the veterans of the imperial army, whom the organs of the Restoration sought to deprive of their well-earned rewards. He vigorously attacked the lavish expenditure of public money for the maintenance of useless establishments, and to support the instruments of an anti-national party; but he was always a steady advocate of every expenditure which was requisite for the support of the power and dignity of a great nation. Foy had a hard battle to fight against the retrograde party, which sought to destroy the effects of the constitutional charter by introducing into the electoral body the privileges which the charter had abolished. Yet the efforts of Foy and of a patriotic minority were unavailing against the party, which, according to an expression of Foy himself, reckoned in the legislative chamber two members to one, and in the nation one individual in a thousand. Counter-revolutionary measures followed one another; the elective franchise was restricted, the liberty of the press curtailed, independent writers prosecuted, and the constitutional government of Spain overturned by a French expedition. Notwithstanding all these defeats of the liberal party, Foy never deserted the post where he was placed by the confidence of his countrymen, and he castigated the unprincipled proceedings above referred to with earnest eloquence.

In November 1825, Foy began to suffer from the symptoms of an aneurism: he felt his end approaching, but remained calm and collected under the most severe sufferings, till his death on the 28th of November. His death was considered in France as a national calamity; his funeral was attended not only by his political friends, but even by his opponents, who no longer refused to pay the tribute of just admiration to a deceased adversary. As he left a family in rather straitened circumstances, one million of francs was raised for them by a national subscription. Foy left two volumes of speeches, and a 'History of the Peninsular War,' a work which has been warmly eulogised in England as well as in France, by writers professing political opinions completely opposed to those of General Foy; which he unfortunately, however, left incomplete.

FRACASTORO, HIERONYMUS, one of the most learned men of his time, as well as one of the best modern Latin poets, was born at Verona, in 1483, of an ancient family. From his earliest youth he applied himself to the study of the sciences, particularly to medicine, and he became professor of logic at the university of Padua when he was only nineteen years old. Fracastoro died in 1553. He enjoyed during his lifetime the esteem and friendship of many eminent men of his time, and Ramusio, who owed to Fracastoro the idea as well as many materials for his collection of the 'Navigazioni et Viaggi,' erected a brass statue to his memory at Padua. Julius Caesar Scaliger was such an admirer of Fracastoro's poetical talents that he wrote a poem in his praise, entitled 'Arm Fracastorice.' The principal works of Fracastoro are—'Syphilides, sive morbi Gallici, libri tres,' published at Verona, 1530, in 4to; and subsequently often reprinted elsewhere; besides being translated into French, and several times into Italian: the best Italian translation is that of Vizzento Benini de Colonia, published, with the complete collection of Fracastoro's works, at Padua, 1739, in 4to. Fracastoro's reputation rests chiefly on this work, which he dedicated to Bembo, who was his particular friend, in a poetical epistle, of which Roscoe has given an English translation in his life of Leo X. It is remarkable that the name of the hero, Syphilis, from which the title of the poem is derived, gave birth to the technical appellation by which the above-mentioned disease is known. It seems that in adopting such a subject for his poem Fracastoro wished to display in one work his extensive knowledge in the various branches of natural philosophy, his skill in medicine, and his admirable genius for Latin poetry. Besides the poem of 'Syphilis,' Fracastoro published the following works:—'De Vini Temperatura,' Venice, 1531, in 4to; 'Homocentricorum, sive de Stellis, liber unus de Causis Criti-

corum dierum, libellus,' Venice, 1535, in 4to; 1538, 8vo; 'De Sympathia et Antipathia Rerum, liber unus; de Contagionibus et Contagiosis Morbis, et eorum Curatione, libri tres,' Venice, 1546, in 4to. Fracastoro began a poem entitled 'Joseph,' but he was prevented by death from finishing more than two cantos. He also left a volume of Latin poetry on different subjects, addressed to several eminent personages of his time. All these poetical productions were collected and published at Padua, 1728, 8vo. The complete works of Fracastoro appeared for the first time at Venice, 1555, in 4to, and they have been many times reprinted there and elsewhere.

FRANCESCA, PIERO DELLA, called also PIERO BORGHESE, from his native place, Borgo San Sepolcro, where he was born about 1398. His chief excellence was in perspective, which he was the first to fully develop in practice; in other respects his works, of which few remain, are in the dry, hard, antique style of the period. Piero's greatest work is the legendary history of the Cross, in San Francesco, at Arezzo: it is still preserved, though much injured by time and ill-usage. He died about 1484.

Piero's theoretical knowledge of perspective appears to have been considerable, and he was, according to Vasari, one of the best geometers of his time: he wrote several treatises on these subjects, some of which are still preserved at Borgo San Sepolcro. Some of his writings, says Vasari, were dishonestly published by his pupil, Fra Luca dal Borgo, or Luca Pacciolo, as his own; but the truth of this statement is doubted. Luca's works are, 'Summa Arithmetica,' 'La Divina Proporzione,' with figures by Leonardo da Vinci; and 'Interpretazione di Euclide.' He did not write on perspective; but where he notices the subject, he alludes to Piero della Francesca as 'el monarca de la pintura.' A 'Life of Piero' was published at Florence in 1835 by Gherardi Dragomanni.

(Vasari, *Vite de' Pittori*, &c.; Lanzi, *Storia Pittorica*; and the Notes to Schorn's German translation of Vasari; see also Rumohr, *Italianische Forschungen*.)

FRANCIA, FRANCESCO, the name by which Francesco Raibolini is known, and which he wrote upon his works, after the name of his master the goldsmith. Francia is one of the most celebrated of the Italian painters, and the most perfect in his style, the 'antico-moderno,' or that transition style between the comparatively meagre works of the most distinguished early masters and the fully-developed form and character of the works of Raffaele and his great contemporaries. He was born at Bologna about 1450, and he died there, according to a document discovered by Calvi, on the 6th of January 1518. Vasari says that he died of vexation upon seeing the St. Cecilia of Raffaele, which was consigned to him in Bologna for the church of San Giovanni: but, as he was sixty-eight years of age, there appears to be little necessity for assigning any such cause for his death. Francia was by education a goldsmith and a die- and niello-engraver, and he is supposed to have taken up painting at a comparatively late period: he must however have had some reputation as a painter in 1490, as he was then employed on extensive works in the Palazzo Bentivoglio at Bologna. He was an admirable colourist, and the greatest master of Bologna before the Caracci. He signed himself 'Aurifex' on his paintings, and 'Pictor' on his jewellery. The two pictures by him in the National Gallery are admirable specimens of his style, and perhaps more perfect individual specimens than any other of the foreign pictures in the collection: they originally formed an altar-piece in the Buonvisi chapel, in the church of San Fridiano, Lucca, whence they passed into the Duke of Lucca's collection, and were eventually purchased for the nation in 1840 for 3500*l*.

GIACOMO FRANCIA, the son and pupil of Francesco, painted in his father's style, and, though far from equalling his father, was a good painter: he died in 1557.

(Vasari, *Vite de' Pittori*, &c.; Malvasia, *Felsina Pittorica*; Lanzi, *Storia Pittorica*; Calvi, *Memorie della Vita e delle Opere di Francesco Raibolini detto il Francia*.)

FRANCIA, DOCTOR JOSÉ GASPAR RODRIGUEZ (and he himself at least appears to have written the name with the feudal prefix, De Francia), Dictator of Paraguay, is said to have been born near the town of Assuncion, the capital of that country, in 1737 or 1758. His father, a European, was a chacarero, or small proprietor cultivating his own land. Francia himself, who had a passion for everything French, alleged that his father came from France, but others have asserted that he was a Portuguese. However that may be, old Francia had gone to Brazil, and, proceeding thence to the Spanish possessions in the interior, had finally settled in Paraguay, where he married a Creole, and had this José and other sons and daughters. José was the eldest.

When he came to the proper age, young Francia was sent to the University of Cordova, in the neighbouring province of Tucuman, to be educated for the church. Here he took his doctor's degree, but it is uncertain whether of divinity or of law. The latter he ultimately determined to make his profession. The change was perhaps prompted in part by the turn which his opinions had taken or begun to take towards deism, the avowed creed of his later years, which he had imbibed from reading the works of Rousseau, Raynal, and other French writers of that school. He seems to have spoken as well as read the French language; and he also brought away with him from college, besides what he learned of law and theology, some knowledge

of mathematics and of mechanical philosophy, a taste for which departments of study he preserved to the end of his life. Establishing himself in the town of Assuncion, Francia spent there perhaps the next thirty years of his life as an advocate or barrister. He had a good practice, and a high reputation both for legal learning and for integrity and independence of character.

The revolution which brought about the independence of the Spanish possessions in South America began in Buenos Ayres in 1810, when Francia was fifty-two or fifty-three years old. Paraguay refused to join the other La Plata provinces in this movement, and was successful in repelling a force sent from Buenos Ayres under General Belgrano to compel its adherence; but the next year it accomplished a revolution of its own. Francia had been active in directing this course which things had taken, and when the independent junta was set up, with Don Fulgencio Yegros, the general who had defeated Belgrano, as president, Francia was appointed secretary. Yegros and the others however could not get on with him—or he with them—and he soon resigned his post, retiring to a country house in the neighbourhood of Assuncion. Everything went from bad to worse, and the Paraguayan public mind seems to have taken up a fixed idea that only Francia could set matters right. Accordingly, a new congress which assembled in 1813 placed him and Yegros at the head of the republic under the name of joint consuls. From this moment the state of public affairs began to improve; in particular the protection of the country from foreign invasion, a calamity which had actually begun to come upon it before from some quarters, and been threatened from others, was effectually secured. It was with a view to this particular object that Francia first introduced his non-intercourse system. The peculiar character which had been impressed upon society in that country by the Jesuits at the same time favoured and may have partly suggested the policy which he thus adopted; and the course of events, after it was tried and found to answer, led by degrees to its more strict enforcement. It became at last so complete that, as is well known, all ingress into Paraguay or escape from it became nearly impossible, nor had the country any political relations, or almost any commercial communication, with any other part of the globe.

Before matters came to this however, Francia's joint consulship had been converted, first in 1814, by a third congress, into a dictatorship for three years, and then in 1817 into a dictatorship for life. Yegros, who had been all along a mere cypher or useless incumbrance, was of course got rid of. He afterwards, in 1819, it is asserted, engaged in a conspiracy for the assassination of his former colleague; the detection and defeat of which at the same time consolidated and greatly strengthened Francia's power. It appears to have been principally during the existence of the critical state of affairs produced by this plot, a period of two or three years, that the system of sanguinary severity which has been called the reign of terror was kept up by Francia.

Francia remained supreme and absolute master of Paraguay till his death on the 20th of September 1840, when he was succeeded by a directory, or governing junta, of three persons.

The instances of Francia's tyranny as exercised on foreigners, that have had the greatest noise made about them, are those of his treatment of M. Bonpland, Messrs. Rengger and Longchamp, and the Messrs. Robertson. Bonpland, the distinguished botanist, had set up an establishment for the culture of Paraguay tea in the adjoining district of Entre Rios, a sort of debatable land, and was there seized in 1821 by order of Francia, and carried off into Paraguay, where he was detained till February 1831; but, beyond his forcible detention, he was not harshly treated. [BONPLAND.] Messrs. Rengger and Longchamp were two Swiss surgeons who had found their way into Paraguay in 1819, and were detained by the dictator, principally, it would appear, for the sake of their professional services, till 1825. After their return to Europe they published an account of their adventures and of the country under the title of 'Essai Historique sur la Révolution de Paraguay, et le Gouvernement Dictatorial du Docteur Francia.' The Messrs. Robertson were not detained in the country, but turned out of it. They have told their own story, though rather confusedly, in their 'Letters on Paraguay,' 2 vols. 8vo, London, 1838, and 'Francia's Reign of Terror,' 8vo, London, 1839. The most distinct and graphic sketch that has been drawn, at least in English, of Francia and his career, is in a very characteristic paper by Mr. Carlyle, in the 62nd No. of the 'Foreign Quarterly Review' (for July 1843), pp. 544—589. If it should be thought too much to soften some of the more startling points in the dictator's character and conduct, and to give him the benefit of a favourable doubt somewhat too liberally, it may be corrected by comparison with the Messrs. Robertson's unmix'd and unmeasured condemnation. Mr. Carlyle has derived some of his facts from a funeral discourse delivered at the celebration of the obsequies of Francia by the Rev. Manuel Antonio Perez, in which his government is lauded in the highest terms.

FRANCIS, SAINT, the founder of one of the four orders of mendicant friars, called Franciscans, was born at Assisi, in Umbria, in 1182. He was the son of Peter de Bernardino, a wealthy merchant, and his mother's name was Pica. His mother christened him John, but his father, who was absent at the time of his birth, changed his name to Francis. Wadding, in the 'Annales Minorum,' says, because he learned French early, to qualify himself for his father's profession,

Jacobus de Voragine turns it into a miracle; "Primo ratione miraculi connotandi: linguam enim Gallicam miraculose a Deo recepiisse cognoscitur." ('Acta Sanctor.' Octob., tom. ii., p. 559.) St. Francis was at first a young man of dissolute manners, but in consequence of a fit of sickness about the year 1206, he became so strongly affected with religious zeal as to take a resolution to retire from the world. He now devoted himself to solitude, and mortified himself to so great a degree that the inhabitants of Assisi judged him to be distracted. His father, thinking to make him resume the habits of ordinary life, threw him into prison; but finding that this made no impression upon him, he carried him before the Bishop of Assisi, in order to make him renounce all title to his father's temporal possessions, which he not only agreed to, but stripped off all his clothes, even to his shirt. He then prevailed with a considerable number of persons to devote themselves, as he had done, to the poverty which he considered as enjoined by the gospel, and drew up an institute, or rule, for their use, which was approved by Pope Innocent III. in 1210, as well as by the Council of Lateran held in 1215. In 1211 he obtained from the Benedictines the church of Portiuncula, near Assisi, and his Order increased so fast that when he held a chapter in 1219, near 5000 friars of it were present. He subsequently obtained a bull in favour of his Order from Pope Honorius III. About this time he went into the Holy Land, and endeavoured in vain to convert the Sultan Meledin. It is said that he offered to throw himself into the flames to prove his faith in what he taught. He returned soon after to his native country, and died at Assisi in 1226. He was canonised by Pope Gregory IX. the 6th of May 1230, when October 4th, the day on which his death happened, was appointed as his festival.

The followers of St. Francis were called Franciscans, Gray or Minor Friars; the first name they had from their founder; the second from their gray clothing; and the third from a pretended humility. Their habit was a loose garment of a gray colour, reaching to their ankles, with a cowl of the same, and a cloak over it when they went abroad. They girded themselves with cords, and went bare-footed.

This order was divided into several bodies, some of which were more rigid than others. The most ample and circumstantial account of it is to be found in 'Annales Minorum, seu Trium Ordinum à S. Francisco Institutorum, auctore Luca Waddingo Hiberno;' the second and best edition of which was published at Rome by Jos. Maria Fonseca ab Ebor., in 19 vols., fol., 1731-44, with a supplement, 'Opus posthumum Fr. Jo. Hyacinthi Sbaralea,' fol., Rome, 1806. To Wadding we are indebted for the 'Opuscula S. Francisci,' 4to, Antw., 1628; and the 'Bibliotheca Ordinis Minorum,' 4to, Rome, 1650. The 'Acta Sanctorum' of the Bollandists already quoted ('Octob., tom. ii., p. 545-1004), contains several lives of St. Francis, including that by St. Bonaventure.

Davenport ('Hist. Fratr. Min.,' p. 2) says this order came into England in 1219; but Stow, Dugdale, Leland, and others say the Franciscans came in 1224, and that they had their first house in Canterbury, and their second at London. Tanner says ('Notit. Monast.,' pref. p. 13), that at the dissolution the Conventual Franciscans had about fifty-five houses in England; but from the last edition of Dugdale's 'Monasticon,' it appears they had sixty-six. Their rule, as translated by Stevens, with several charters of Edward III. and one of Richard II. in favour of them, will be found in that work, vol. vi., p. iii., pp. 1504-08. See also Parkinson's 'Collectanea Anglo-Minoritica, or a Collection of the Antiquities of the English Franciscans, or Friars Minors, commonly called Gray Friars,' 4to, London, 1726. The original of the Franciscan rule will be found in Wadding's 'Annales,' vol. i., pp. 66-79.

FRANCIS I. of France was, like Louis XII., descended from Charles the Wise through Louis I., duke of Orleans. This unfortunate prince was assassinated by John, duke of Burgundy, and his two sons were for a long period prisoners to the English. The younger of the two, John, count of Angoulême, was succeeded by his son Charles. During the life of Louis XI. the Count of Angoulême had some difficulty in guarding against the jealousy of the king, and by his command married Louisa of Savoy, who, on the 12th of September 1494, became the mother of Francis I. Louis XII. took charge of the infant heir of Angoulême at the death of his father, and afterwards gave him his daughter Claude in marriage. Francis distinguished himself in the defence of the frontiers on the side of Spain and Flanders, and succeeded to the throne at the age of twenty-one, in January 1515.

One of his first endeavours was to prosecute the claim on the duchy of Milan, which he derived from his grandmother Valentine. Against this expedition the Swiss had already combined with Pope Leo X. and with the King of Spain; but Francis having passed the Alps unexpectedly, a battle took place at Marignano, in which the Swiss infantry fought with even more than their usual obstinacy and courage. The combat lasted two days, and from 10,000 to 15,000 Swiss are said to have fallen in it. The victorious French entered Milan on the 23rd of October 1515, and a peace was shortly after concluded with the pope.

In January 1516 the prince (afterwards Charles V.) who was destined to be the rival of Francis throughout his whole career, succeeded to the kingdom of Castile notwithstanding his mother Joan was still

alive. The frontier states to France on the side of Flanders and of the Pyrenees were thus in the hands of one and the same monarch. The treaty of Noyon (1516) re-established for a short time the peace of Europe; and the King of France endeavoured to prepare himself against future wars by securing the friendship of the Swiss, whom he had learnt to appreciate as enemies. The Venetians and the Pope also became his allies.

On the death of Maximilian, emperor of Germany (1519), Charles and Francis declared themselves candidates for the imperial crown. The former urged his claims as one of the house of Austria and as the only prince in Europe who, by uniting the wealth of the New World and the arms of the Old, could arrest the progress of the Sultan Selim II. Francis put forward his greater experience in war, and dwelt on the impolicy of placing the joint power of Spain, Flanders, Naples, and the empire in the hands of an Austrian prince. Henry VIII. of England was inclined to become a competitor himself, while Leo X. would gladly have seen on the German throne some prince of less importance than Charles or Francis, and one who had no power or claim in Italy. It is said that the crown was offered to the elector of Saxony, who declined it and secured the election of Charles. Francis had an interview with the King of England between Guines and Ardres, and Charles landed at Dover on his voyage from Corunna to the Netherlands (1520).

In 1521 Francis made an attempt to recover Navarre for the family of Jean D'Albret; but after the capture of Pampeluna the French were repulsed from before Logroño, and finally lost all they had previously gained. Another cause of quarrel arose from Robert de la Mark, lord of Bouillon, declaring war against the emperor and throwing himself on France. Mézières was defended by Bayard against the imperial army, and a pretended attempt at mediation having been made by Wolsey, who was intriguing for the papal crown, a league was concluded against Francis by the emperor, the king of England, and the pope. Lautrec, the general of Francis, being deserted by his Swiss auxiliaries, was driven from the Milanese by Prosper Colonna; Parma and Placentia were united to the ecclesiastical states; and the death of Leo X. is said to have been accelerated by joy at the successes of his allies (1521). The French, although reinforced by 10,000 Swiss, were defeated at Bicocca, and while Milan and Genoa were being lost in Italy, Henry of England attacked Picardy and Normandy. In 1523 the Venetians, hitherto friendly to Francis, joined the pope and the emperor against him; and his own subject, the constable of Bourbon, exposed to the vengeance of alighted love on the part of the king's mother, fled to his enemies. The French under Bonnivet however passed the Ticino in spite of the veteran Prosper Colonna; and the failure of three attacks on the side of Gascony, Burgundy, and Picardy left Francis in as good a position as the strength of his adversaries could allow him to hope for. In the spring of 1524 Pescara and Bourbon defeated the French on the Seaia; and in this battle fell Bayard, "the knight without fear and without reproach." An attempt on the part of the imperialists to maintain the war in Provence was frustrated by the king, who passed the Cenis and advanced on Milan. Of that city he obtained possession; but by laying siege to Pavia, which was gallantly defended by Antonio de Leyva, he gave time for the imperial generals to reorganise their forces. This they did with such effect, that on the 24th of February 1525, they utterly defeated the French troops, and Francis himself remained a prisoner in the hands of Lannoy, vice-king of Naples. He announced the result of the battle of Pavia to his mother in the celebrated words, "Tout est perdu fors l'honneur!"

Charles demanded, as the ransom of the French king, Burgundy for himself, Provence and Dauphiny for Bourbon, and the renunciation of all claims on the Italian states. He caused his prisoner to be conveyed by sea from Genoa to Barcelona, and thence to Madrid, where he detained him in rigorous confinement, until the alteration in his health made the emperor fear the loss of all the advantages which he had anticipated. At length the treaty of Madrid was arranged (1526). Francis was to cede Burgundy, to give up all claims on Italy or on the sovereignty of Flanders and Artois, to restore Bourbon to his dignities and estates, to marry Eleanor, queen dowager of Portugal, sister to the emperor, and finally to deliver his eldest and second sons as hostages for the fulfilment of these stipulations. While he pledged his oath and honour for the observance of the conditions of the treaty, he caused a secret protest against the validity of his promise to be prepared. He set foot in France a little more than a year after the battle of Pavia, and mounting his horse, put him into a gallop, exclaiming, "I am yet a king!"

It very soon became obvious that the French king did not intend to adhere to the treaty of Madrid. While Charles in vain demanded the fulfilment of his oath, from which the pope had absolved him, Francis entered into a league with the Venetians, Clement, and Henry of England. The imperial generals, taking advantage of a delay on the part of the French, reduced the castle of Milan, though obstinately defended by Sforza, whom Charles had already declared to have forfeited his duchy. In 1527 Bourbon advanced upon Rome; he himself fell in the assault of that city, which suffered more from the army of a Christian emperor, the especial patron of the Roman see, than it had ever done from the most barbarous of its heathen invaders. Clement himself, shut up in the castle of St. Angelo, was at length obliged to

surrender, and was only released for a heavy ransom at the termination of six months.

Notwithstanding some disposition on the part of the emperor to relax the terms of the treaty of Madrid, the negotiations terminated in a declaration of war on the part of France and England. Charles accused his rival of perjury, to which Francis replied by a challenge to single combat.

In February 1523, the imperial army, wasted by the disease consequent on its excesses, was with difficulty dragged off from the miserable city on which it had preyed for ten months. Lautrec followed them, and sat down before Naples; but the French army were in their turn attacked by disease, and finally reduced to a wretched remnant, which surrendered to the Prince of Orange at Aversa. Andrew Doria, disgusted with the conduct of the French, renounced their alliance, and liberated Genoa, while Antonio de Leyva ruined the French army in the Milanese as completely as the Prince of Orange had ruined that which besieged Naples. The success of the Turk in Hungary, and the progress of the Reformation, inclined the emperor to peace, and the treaty of Cambray was concluded by the negotiations of Margaret of Austria and Louisa of Savoy (August 5, 1529). Charles agreed not to urge his claim on Burgundy, while Francis renounced the sovereignty of Flanders, abandoned Italy, and bound himself to pay 2,000,000 crowns as the ransom of his sons. In consequence of a treaty between the pope and the emperor, Florence was restored to the Medici, and Clement allowed himself to be guided by the wishes of Charles as to the divorce of Catherine of Aragon from Henry VIII. He met however with eagerness a proposal on the part of Francis for the marriage of his niece, Catherine de' Medici, to the Duke of Orleans, afterwards Henri II.

The dissensions in the empire manifested by the diet of Augs-burg (1530) and the league of Schmalkalden, induced the French king to encourage that religious party in Germany which he persecuted in his own dominions. During the absence of Charles in Africa (1535) he advanced into Italy under pretext of punishing Sforza, now returned to his duchy, for the execution of his ambassador, and seized the territory of Savoy. It was not until the spring of 1536 that the emperor was able to take active measures against him. Sforza died, and the imperial troops drove the French out of Savoy and advanced to the frontiers of Provence. The French had laid waste the whole of Dauphiny; and although Arles and Marseille were besieged, Montmorency, a second Fabius, kept his troops under the walls of Avignon and refused to risk a battle. This policy succeeded so well, that at the end of two months the imperial army was compelled to retreat in a miserable state. After an attack by the French on the side of Flanders, a cessation of arms was at length agreed on through the mediation of the two sisters, the queens of Hungary and France. The exhausted state of his treasury, and the fear of an alliance between Francis and the Turk, induced Charles to consent to a cessation of arms in Piedmont also, which was followed by a truce for ten years, concluded at Nice.

Charles then embarked for Barcelona, but being detained by contrary winds on the coast of Provence, Francis proposed a personal interview. The French king went on board the emperor's galley, and the latter returned his visit at Aigues Mortes. Thus after years of the bitterest hostility and enmity, after accusations of perjury on the one hand and of murder on the other, and after a challenge to mortal combat, these two princes presented the singular spectacle of apparent reliance on each other's good faith and honour. The marriage of James V. of Scotland with Magdalen of France, and afterwards with Mary of Guise, tended greatly to estrange Henry of England from the French court, while a better understanding seems to have followed the interview of Charles and Francis. A proposal made by the citizens of Ghent to deliver their town into the hands of the latter, was not only rejected, but the designs of the malcontents were betrayed to the emperor (1539). Charles put the sincerity of his new friendship to a more severe test, by asking permission to pass through France on his way from Spain to the Low Countries. Francis met him at Chatellerault and received him as his guest in Paris. A promise was made of investing the duke of Orleans with the duchy of Milan; but all demands for its fulfilment on the part of the ambassadors of Francis were evaded by the emperor.

While the latter was preparing his expedition to Algiers the king of France sent to demand satisfaction for the murder of his ambassador to the Porte, Rincon, who was assassinated, if not by the orders, at least with the connivance of the Marquis del Vasto, the governor of Milan. On the ground of this outrage war was again declared (1542), but the king of England and the Protestant princes remained firm to the emperor. The subsequent operations in Roussillon, Flanders, and Piedmont, produced no events of importance until the battle of Cerisoles (April 11, 1544), in which the French were completely victorious. On the other hand, Charles advanced into Champagne with a large and well-appointed army, and Henry VIII. besieged Boulogne. On the 11th September 1544, a peace was concluded at Crespi, which the emperor consented to, principally from fear of the Turk and from the increasing strength of the Protestants. Francis did his utmost to animate these two parties; but in 1547, on the last day of March, the death of the French king relieved his opponent from many of the apprehensions which he had entertained.

In reviewing the position of Francis during his whole struggle with the emperor, we are struck with the enormous force against which he had to contend. France, in his reign, sustained the same character in which she appeared again in the following century. As in the time of the thirty years' war, she, a Catholic power, aided the Protestant cause; so in the early part of the 16th century, when the danger was the more imminent, from the whole strength being concentrated in the hands of Charles V., the French king was the only efficient hindrance to the universal monarchy of the house of Austria. It was Francis I. who favoured the revolt of Geneva from the Duke of Savoy, and enabled that city to found an independence which was afterwards to become one of the main props of the reformed faith. While however he fostered religious rebellion in Germany, he proved his orthodoxy in Paris by the utmost cruelty to the heretics. The gallant manner in which he struggled against his formidable rival, and grappled with him again and again after the heaviest blows, excites our sympathy in his favour: his personal courage was undoubted, and his generosity on the two occasions in which Charles put himself in his power, more chivalrous than his conduct with reference to the treaty of Madrid. "If it was perjury, every Frenchman was his accomplice." This conduct has indeed been defended by French writers; but the hard nature of the conditions cannot justify an open and deliberate oath, accompanied by a secret protest as its antidote. Francis is said to have requested knighthood from the sword of Bayard, and his usual mode of affirming what he said was—"Foi de Gentilhomme." In his family Francis was far from happy: by his first wife Claude of France, daughter of Louis XII., he had three sons and four daughters; his eldest, the Dauphin, was said to have been poisoned by his cup-bearer, Montecuculi: whether such was the fact is very doubtful, and there is certainly no reason to suppose that the crime was instigated by Charles V. The second son succeeded to the throne by the title of Henry II. His second wife, Eleanor of Portugal, bore him no children. His private life is not entitled to much praise. Madame de Chateaubriand, sister of Laotrec, the Duchesse d'Etampes, and la belle Féronière, were successively his mistresses: to vengeance on the part of the husband of the last he is said to have owed his death. In his reign ladies for the first time became constant attendants at the French court, and the foundation was laid for those profligate manners so fully developed in the succeeding reigns.

As the patron of art and literature, Francis I. ranks deservedly high. He reigned at the moment when sounder learning and higher principles of art were spreading from Italy to the rest of Europe. Budé, Lascaris, Erasmus, the Stephens, and Marot, were enabled to boast of his countenance to letters: he is well known as the patron of Primaticcio and Cellini; while a greater man than either, Leonardo da Vinci, is said to have died in his arms.

(Robertson, *Charles V.*; Père Daniel, *Histoire de France*; Bayle, *Dictionnaire*; Biographies Universelle; Leopold Ranke, *Geschichte der Päpste*.)

FRANCIS II. of France, born in 1548, was the eldest son of Henri II. and of Catherine de' Medici. He married, in 1558, Mary Stuart, only daughter of James V. of Scotland. On the death of his father, 10th of July 1559, Francis became king, being then sixteen years of age. He entrusted the government to Francis duke of Guise and his brother the Cardinal of Lorraine, uncles of Mary Stuart. This was the beginning of the civil and religious wars which desolated France for half a century. Anthony of Bourbon, king of Navarre, and Louis his brother, prince of Condé, with the other princes of the blood, and the great officers of the state, being indignant at seeing all the power of the state in the hands of two strangers, conspired against the Guises, and joined the Protestants for that purpose, as the Guises were the zealous supporters of Catholicism. In March 1560, the Guises having been informed of a conspiracy against them, removed the king and court to the castle of Amboise; the king named the Duke of Guise lieutenant-general of the kingdom, and a number of persons were arrested and executed. Soon after, the edict of Romorantin was issued, which constituted the bishops judges of heresy, and took the cognisance of this offence from the parliaments. It was said that the chancellor De l'Hôpital consented to this edict in order to avoid a greater evil, namely, the establishment of the Inquisition in France, which was proposed by the Cardinal de Lorraine. By a former edict, issued at Escouen by Henri II. in June 1559, all the Lutherans were declared punishable by death. The name of Huguenots, to denote the Calvinists as a distinct sect, was introduced soon after. The Admiral de Coligni having presented to the king a memorial in their favour, it was resolved, at the suggestion of the chancellor De l'Hôpital, to leave them in peace, until the general council should decide, and that if the pope did not assemble a general council, a national council should be convoked in France. The king assembled the states-general at Orleans, when the prince of Condé, on his arrival, was arrested on the charge of a conspiracy, and condemned to lose his head; but he was saved by the death of the king, 5th December 1560, after a reign of only seventeen months. He was succeeded by his brother Charles IX., then a minor. Francis II. died of an abscess in his ear; and the rumours of poison which were spread at the time seem, according to De Thou and other historians, without foundation.

FRANCIS I., emperor of Germany, born in 1708, was the son of Leopold duke of Lorraine, who was the son of Charles V. of Lorraine, and of Eleonora Maria, daughter of the emperor Ferdinand III. Francis's mother was the Princess of Orleans, niece of Louis XIV. On the death of his father in 1729, Francis succeeded him as duke of Lorraine and Bar. In consequence of the war of the Polish succession, Lorraine was ceded to Stanislaus Leczinski, father-in-law of Louis XV., to revert after his death to the crown of France, and Francis received Tuscany in exchange, which duchy became vacant by the extinction of the house of Medici. Francis married in 1736 Maria Theresa of Austria, the only daughter and heiress of the emperor Charles VI. In January 1739, he went to reside at Florence with his consort. In 1740 Charles VI. died, and Maria Theresa succeeding him in the hereditary dominions of the house of Austria, she made her husband coregent with herself, but gave him little share in the administration. He however commanded her armies in the war which she had to sustain in order to secure her inheritance. [MARIA THERESA.] After the death of the emperor Charles VII. in 1745, Francis was elected his successor on the imperial throne. In 1748 the peace of Aix-la-Chapelle restored peace to Germany and to Europe; but in 1756 a new war broke out between Prussia and Austria, known by the name of the Seven Years' War, which was terminated by the peace of Hubertsburg, in February 1763. The following year Joseph, the eldest son of Francis, was elected king of the Romans, and in 1765 Francis died at Innsbruck, and Joseph succeeded him as emperor of Germany; his mother retaining in her hands the sovereignty of the Austrian dominions till her death. As emperor of Germany and grand-duke of Tuscany, Francis left behind him the reputation of a good prince, though he was involved in long wars against his inclination.

FRANCIS II., emperor of Germany, and I. of Austria, the eldest son of Leopold II. and of Maria Louisa of Spain, was born at Florence in February 1768. At an early age he was sent to Vienna to be brought up under the eyes of his uncle, Joseph II., who gave him the best preceptors in that capital. He was well instructed in the art of administration, and he made himself master of all its details. He was also engaged in several campaigns against the Turks, and was present at the taking of Belgrade, by General Laudon, in 1789. When Joseph II. died, in 1790, Francis took the direction of the government till the arrival of his father from Florence. Two years afterwards Leopold himself died, in 1792, and Francis, who succeeded to his vast dominions, was likewise elected his successor to the imperial crown. He came to the throne at a very anxious moment. The rash or premature, though well-meant reforms of Joseph II., had sown deep discontent in several parts of the hereditary states of Austria, which the conciliatory measures of Leopold had not had time to allay: the Belgians were in open revolt, and Francis himself was on the eve of a war with France. In April 1792, Louis XVI. was obliged, by the legislative assembly, to declare war against him. The Austrian armies on the Rhine carried on the war for some years with varied success, and without any definite result; but the successes of Bonaparte in Italy, in 1796-97, decided the fate of the war. [BONAPARTE.] By the treaty of Campoformio, Francis gave up Belgium and the duchy of Milan, receiving in exchange Venice and Dalmatia. In 1799 a new coalition took place between Austria, Russia, and England, and the allied armies were eminently successful, both in Italy and Germany; but a misunderstanding between the Austrian and Russian commanders led to the defeat of the Russians in Switzerland. In 1800, Bonaparte having won the battle of Marengo and reconquered Lombardy, negotiations of peace followed; but Francis refused to treat separately from his ally, England, and hostilities began afresh. The French under Moreau having gained the battle of Hohenlinden, advanced towards Vienna, when Francis proposed peace, and the treaty of Luneville followed in 1801, by which Ferdinand, the emperor's brother, was obliged to give up Tuscany, and his uncle to renounce Modena. In December 1804, while Napoleon crowned himself emperor of France at Paris, Francis foreseeing the approaching dissolution of the German empire, declared himself hereditary emperor of Austria. In 1805, feeling jealous of the new encroachments of Napoleon I. in Italy and Holland, the Austrian cabinet formed a new coalition with Russia and England. The campaign was unfavourable to Austria, the French entered Vienna, and the battle of Austerlitz finished the war. By the following peace of Presburg, December 1805, Austria gave up the Venetian states and the Tyrol. The old German empire was now dissolved after a thousand years' duration: and in August 1806, Francis renounced the title of emperor of Germany, and assumed that of Francis I., emperor of Austria, king of Bohemia and Hungary, &c. He now availed himself of some years of peace to repair the calamities of the former wars, to make reductions, enforce a strict economy, and support the credit of the state. In the war of Napoleon I. against Prussia, 1806-7, Austria maintained a strict neutrality. After the peace of Tilsit and the conferences of Erfurt between Napoleon I. and Alexander, the occupation of North Germany by the French, and the invasion of Spain, the emperor Francis felt alarmed, and prepared for a fresh struggle, which he saw must take place sooner or later for the independence of his crown. Availing himself of Napoleon's embarrassments in Spain, at the beginning of 1809, he began alone a fourth war against France, with a force of 400,000 men. The archduke Charles commanded the army of Germany, and the arch-

duke John that of Italy, whilst a force under General Chasteler entered the Tyrol, where the people rose to a man for their former sovereign. This war had a different character from the preceding, inasmuch as the people of Germany began now to take part against the French: corps of partisans were formed under Schill, the duke of Brunswick Oels, and others who annoyed the French, and a general spirit of insurrection manifested itself against the foreign yoke. The operations of the war were also conducted on a different plan from the former wars of Marengo, Austerlitz, and Jena, when a single battle had decided the fate of the contest. The Austrians now fought detached engagements with various success, and although obliged to retire, and even to abandon Vienna, the archduke Charles kept his army together in good order. The battle of Aspern was fought with a tremendous loss on both sides, and Napoleon I. was obliged to retire across the Danube. After some time the battle of Wagram took place, and although lost by the Austrians, yet the archduke retired in good order towards Bohemia. He proposed an armistice, which Napoleon I. accepted, and after long negotiations the peace of Schönbrunn took place in October 1809.

In 1810 Napoleon I. married a daughter of the emperor Francis. In 1812, during the Russian campaign, an auxiliary Austrian corps under Schwarzenberg, acted in Poland against Russia, but it effected little. In 1813 Austria resumed its neutrality, and offered its mediation between Russia and France on condition that both powers should evacuate Germany. On Napoleon's refusal, Austria joined the allies, and its army contributed largely to the success of the great battle of Leipzig, which decided that campaign. In the following year the Austrian armies entered France by the way of Switzerland, and occupied Burgundy and Lyon. The emperor Francis followed the movements of his troops, and after the Russians and Prussians had entered Paris, in April 1814, he proceeded to that capital, where he remained two months. In June 1814 he returned to Vienna, where the congress of the European powers opened its sittings. In 1815, after Bonaparte's return from Elba, the Austrian troops advanced again by the Simplon road and occupied Lyon. Meantime another Austrian army had driven Murat from Naples and re-established the old king Ferdinand. From that epoch till his death the emperor Francis remained at peace, with the exception of a short campaign against the constitutional party at Naples in 1821, when his troops appeared as auxiliaries to King Ferdinand. When the events of July 1830 were known at Vienna, Francis and his minister, Prince Metternich, withstood the suggestions of the more violent legitimists, and determined, as England had already done, not to interfere in the internal affairs of France, provided that power respected the existing treaties with regard to its foreign policy. Prussia followed the same course, and thus Europe was saved from another general war. Francis died at Vienna on the 2nd of March 1835, in his sixty-seventh year, and was succeeded by his eldest son FERDINAND, who, after a quiet reign of twelve years, but one in which the country was bowed down under the yoke of a leaden despotism, was forced by the revolutionary events, as noticed below [FRANCIS-JOSEPH-CHARLES], to abdicate on the 2nd of December 1848.

In Austria and his other German states the emperor Francis was popular, and personally beloved, especially by the middling and lower classes. He was accessible, kind, and plain-spoken, simple and regular in his habits, assiduous to business, and his moral conduct was unexceptionable. His policy and administration were of a paternal character. He was averse to every form of political innovation; having suffered much from the French revolution and its consequences, he had conceived a horror of revolutions, and of every movement that partook of a democratic spirit. The ruling principles of his administration were love of order, minuteness of detail, economy, and strict subordination. These principles, which agreed pretty well with the character of his German subjects, clashed with the temper of the people of Italy, whose activity, love of pleasure, military ambition, and national spirit, had been stimulated during twenty years of French dominion. The people of Lombardy, especially the educated classes, felt dissatisfied at being reduced to the condition of an Austrian dependency. Conspiracies were hatched, but they all failed, and only served to render the Austrian government more suspicious and severe. Of the persons implicated some escaped, others were tried and condemned to death, which sentence the emperor commuted to imprisonment for various periods in several fortresses, but mostly in the castle of Spielberg, in Moravia. Francis promoted material improvements, roads, canals, and manufactures. His views of commercial policy were of the old or Colbert school. He deserves praise as the promoter of popular education; he established elementary schools throughout all his dominions, and superintended himself all the details and working of the system: but in this, as in every other matter, his policy was directed towards the prevention or the eradication of all independence of opinion.

• FRANCIS-JOSEPH-CHARLES, Emperor of Austria, was born August 18, 1830, the son of the Archduke Francis-Charles-Joseph, brother of the Emperor Ferdinand, and of Sophia, daughter of Maximilian-Joseph, king of Bavaria. In March 1848, after the expulsion of Louis-Philippe from France, a revolution followed in Vienna, Prince Metternich fled, a free constitution was prepared and accepted by Ferdinand, who soon afterwards withdrew from Vienna to Innsbruck. Insurrections against the Austrian power broke out in

Hungary and Italy, and a diet for the formation of a united German empire was assembled at Frankfurt. Though Vienna had been taken possession of by the imperial troops, and though Radetzky had obtained advantages in Italy, it was felt that a firmer hand than Ferdinand's was required to secure the Hapsburg dynasty from falling. Accordingly Ferdinand abdicated on December 2, 1848, in favour of his nephew, who, though little more than eighteen, was declared of age. Assisted by able counsellors, the military aid of Russia, and a course of policy towards Hungary that can hardly be styled less than treacherous, the revolutionary movement was stayed, and what was called peace—a peace maintained only by large military establishments—secured. In the dispute between England and France with Russia in 1854, the aim of the Emperor of Austria was to trim between the contending powers, and he succeeded. Calling himself an ally of the western allies, he protected as far as he was able the interests of Russia. He thus gained permission to occupy the principalities of Moldavia and Wallachia as protector, and made himself one of the contracting parties in the peace signed at Paris in 1856. The other chief events of his reign have been the intrigues to maintain the superiority of Austria over Prussia in the Germanic Diet, in which he has been on the whole successful; and the signing of a concordat with the pope, in the early part of 1856, by which the influence of the Roman Catholic Church is made all-powerful throughout the Austrian dominions, and which, it is asserted, is the source of much discontent. On April 24, 1854, Francis-Joseph married Elizabeth-Amelia-Eugenia, daughter of the Duke of Bavaria, by whom he has had two daughters.

FRANCIS, REV. DR. PHILIP, was the son of the Rev. John Francis, dean of Lismore, and rector of St. Mary's, Dublin, in which city Philip was born in the early part of the last century. Philip was educated at the University of Dublin, and then entered the church, the profession to which his progenitors for several generations had belonged. About the year 1750 he came over to England, and set up an academy at Esher in Surrey, where Gibbon was for a short time one of his pupils; but the historian in his posthumous memoirs gives no favourable account of the improvement he made. "Francis," he says, "preferred the pleasures of London to the instruction of his pupils." While in this situation he published his poetical translation of "Horace," which immediately brought him into notice, and still continues to be reprinted. It has the advantage of being the only complete modern metrical version in English of the works of that poet, but has no pretensions to be considered an adequate representation of the original. He also published in 1757 a translation of the "Orations of Demosthenes and Æschines," in 2 vols. 4to. Before this he had published two tragedies, "Eugenia," 8vo, 1752, and "Constantine," 8vo, 1754. "Eugenia" was acted at Drury Lane, Garrick sustaining the principal character; but although repeated for nine nights, it was very indifferently received. It is said in the "Biographia Dramatica" to be little more than a free translation of a French tragedy by Grasigni, called "Cénie," of which a literal version was published the same year under the title of "Cénia; or, the Supposed Daughter." "Constantine" was produced at Covent Garden. "It met with very bad success," says the "Biog. Dram.," "although not by many degrees the worst of the productions of that season." These literary performances obtained for the author the acquaintance of many of the most distinguished persons of the time; but he secured a connection more important to his worldly interests by some political pamphlets which he is said to have written, though they seem to have appeared without his name, and their titles are not given in any of the biographical notices of him that we have seen. From a passage in the Preface to his "Translation of Demosthenes," it may be inferred that he took the Whig, or what is commonly called the liberal side of politics. The biographer of his son in the "Annual Obituary" says, that "he is mentioned in Wilkes's 'Letters' as being engaged in some delicate negotiations on the part of the Right Hon. Henry Fox, afterwards Lord Holland." He was chaplain, it seems, to Lord Holland, and assisted in the education of his son Charles, afterwards the distinguished orator. Through Lord Holland's influence he was presented to the rectory of Barrow in Suffolk; in 1764 he was also appointed joint-chaplain to Chelsea College. He died in 1773.

FRANCIS, SIR PHILIP, was the son of the Rev. Dr. Philip Francis, and was born in Dublin on the 22nd of October 1740. When his father came over to England in 1750, he was placed on the foundation of St. Paul's School, London, where he remained about three years. Here, it is worth observing, one of his schoolfellows was Mr. Henry S. Woodfall, afterwards the printer of the "Public Advertiser," and the publisher of the "Letters of Junius." In 1756 he was appointed to a place in the office of his father's patron, Mr. Fox, then secretary of state; and when Fox was succeeded by Pitt in December of this year, young Francis had the good fortune to be recommended to, and retained by, the new secretary. In 1758, through the patronage of Mr. Pitt, he was appointed private secretary to General Bligh, when that officer was sent in command of an expedition against the French coast; and while serving in this capacity he was present at an action fought between the British and French forces in the neighbourhood of Cherbourg. In 1760, on the same recommendation, the Earl of Kinnoul, on being appointed ambassador to Portugal, took Francis with him as his secretary. He returned to England in 1763, when the Right Hon. Wellebore Ellis, afterwards

Lord Mendip, gave him an appointment of some consequence in the War Office, over which he then presided. He retained this place till March 1772, when he resigned in consequence of a quarrel with Lord Barrington, who had by that time succeeded Mr. Ellis. The remainder of that year he spent in travelling through Flanders, Germany, Italy, and France.

In June 1773, soon after his return; he was appointed to the distinguished place of one of the civil members in council for the government of Bengal, with a salary of 10,000*l*. He is said to have owed this appointment to the influence of Lord Barrington, whose hostility therefore would appear to have been now converted into very substantial friendship, or who must be supposed to have had private reasons for such an exercise of his patronage. He set out for India in the summer of 1774, and remained in that country till December 1780, when he resigned his situation and embarked for England, after having had a quarrel with the governor-general Mr. Hastings, which produced a duel, in which Mr. Francis was shot through the body. He had opposed Hastings, and for some time effectually, from his entrance into the council, but the sudden death of two of his colleagues by whom he had been generally supported, had latterly left him in a helpless minority in his contest against the policy of the governor-general.

In 1784 Mr. Francis was returned to parliament for Yarmouth in the Isle of Wight, and soon began to take an active part in the business of the House of Commons, where, although he was not a fluent speaker, the pregnancy of his remarks and the soundness and extent of his information always commanded attention. He took his side from the first with the Whig opposition, and to that party he adhered while he lived. When it was resolved in 1786 to impeach Mr. Hastings, it was proposed that Mr. Francis should be appointed one of the managers of the impeachment; but all the eloquence of Burke, Fox, and Windham (aided by his own) could not overcome the feeling of the House against placing in this situation a man with whom the accused had had a personal quarrel. The motion was twice negatived by large majorities. Nevertheless there was much force in what was urged in its support, and the casuistry of the question was not a little curious and perplexing. The benefit of the talents and information of Mr. Francis was eventually secured to the prosecution by a letter inviting his assistance, which was addressed to him by the unanimous vote of the committee of managers; and his business occupied his chief attention for many years. When the war with France broke out, Mr. Francis adhered to the party of Fox and Grey, and was one of the first and most active members of the famous association of the Friends of the People. At the new election in 1790 he stood candidate for Tewkesbury, but failed in being returned, and he did not sit in that parliament. In 1802 however he was returned for Appleby, by Lord Thanes, and he continued to sit for that borough while he remained in parliament. The question of the abolition of the slave trade was that in which he took the keenest and most active part in the latter term of his parliamentary career; and it is said that in advocating the abolition, he took a course greatly opposed to his private interests. On the formation of the Grenville administration, Mr. Francis was made a knight of the Bath, 29th of October 1806; and it is believed that it was at first intended to send him out to India as governor-general. That appointment however never took place. He retired from parliament in 1807; and after this, the interest which he continued to take in public affairs was chiefly evinced by occasional political pamphlets and contributions to the newspapers.

Great attention was in 1816 drawn to Sir Philip Francis, by Mr. John Taylor's ingenious publication, entitled '*Junius Identified with a distinguished Living Character*,' the object of which was to prove that Sir Philip Francis was the author of the celebrated '*Letters of Junius*.' The evidence adduced in this publication was unquestionably very strong, and much additional confirmatory evidence has since come to light. It may indeed be affirmed, that no case half so strong has yet been made out in favour of any one of the many other conjectures that have been started on the subject of this great literary puzzle. Such well-qualified judges of historical evidence as lords Brougham, Campbell, and Mahon, and Mr. Macaulay, with many other high legal and literary authorities, have declared themselves convinced that Sir Philip Francis wrote '*Junius*;' and though Francis himself persisted to the last in rejecting the honour thus attempted to be thrust upon him, when strangers referred to the subject, yet with his intimates he appears in his later years to have displayed no such desire; while the communications of his widow to Lord Campbell and to Mr. Wade, the editor of Bohn's edition of '*Junius*,' show that Francis, while never directly asserting himself to be Junius, certainly wished his wife to believe that he was that 'great unknown;' knew that she did so believe, and took extraordinary means to encourage that belief. His gift to her, after their marriage, it may be added, was a copy of '*Junius*,' and his posthumous present, which his son found in his bureau, was '*Junius Identified*,' sealed up and addressed to his widow. In any ordinary case the evidence would seem amply sufficient, but we would advise the reader who may take an interest in the question, before accepting as conclusive the evidence in favour of the claim of Sir Philip Francis (a claim by him it has in fact become by the publication of the statement of his widow, and

the '*New Facts*' of Sir Fortunatus Dwaris), to examine carefully the elaborate and singularly acute articles which appeared in the '*Athenæum*' in 1850, pp. 939, 969, 993, &c.; and for the whole question of the authorship of '*Junius*,' the entire series of Junius articles (of which the above formed only a portion) which have from time to time appeared in the '*Athenæum*' since 1848. The reader would also do well before accepting Francis, or any other name yet suggested as that of the author of '*Junius*,' to look through the references under '*Junius*' in the general index to the first 12 vols. of that useful work '*Notes and Queries*.'

The acknowledged publications of Sir Philip Francis (all of them pamphlets) amount to twenty-six in number, according to a list appended to the memoir of his life in the '*Annual Obituary*.' One of the most curious of them is the last, entitled '*Historical Questions*,' exhibited in the Morning Chronicle in January 1818, enlarged, corrected, and improved, 8vo, 1818, which originally appeared in a series of articles in the '*Morning Chronicle*.' Sir Philip Francis died after a long and painful illness, occasioned by disease of the prostate gland, at his house in St. James's Square, 22nd of December 1818. He was twice married, the second time after he had reached the age of seventy, to a Miss Watkins, the daughter of a clergyman. By his first wife he left a son and two daughters.

FRANCIS DE SALES. [SALES.]

FRANCK XAVIER. [XAVIER.]

FRANCKE, a celebrated German philanthropist, whose life presents a striking instance of the good which an individual may effect. Francke was born at Lubeck in 1663. He made such rapid progress in learning that at the age of fourteen he was fit to enter the university, where he devoted himself with great application to the study of divinity and the ancient as well as modern languages. In 1691 he became professor of oriental languages at the University of Halle, and soon afterwards professor of divinity and pastor of the parish of Glaucha, a suburb of Halle. The wretched state of his parishioners, who were sunk in the most abject ignorance and poverty, gave the first impulse to his philanthropic exertions. He began by teaching the children, whom he supported at the same time by small donations. He took a few orphans to educate; their number rapidly increased; and as he was assisted by the contributions of many charitable persons, he gradually extended the sphere of his beneficial activity, and formed several establishments for the education of all classes. In 1698 he laid the foundation of an orphan asylum, though he had scarcely any means of completing the edifice, but the necessary funds were constantly supplied by charitable persons. He was fortunate in finding not only persons who contributed money to promote his undertaking, but many who zealously assisted him in his labours. Francke was a man of mild and cheerful disposition, agreeable manners, and exceedingly laborious. He punctually attended to his academical lectures, and to his clerical duties at Halle as well as in Glaucha; his affairs and extensive correspondence engrossed all the day, and it was only late at night that he could occupy himself with his literary labours, the earnings of which he always devoted to charitable purposes. The greater part of his works were written in German, but he published also some learned works on divinity in Latin. Francke died in 1727, and the following establishments, all of which we believe still exist at Halle, owe to him their foundation and bear his name:—1, the Orphan Asylum, in which poor orphans of both sexes are gratuitously educated; 2, the Pedagogium, an institution for the education of young men of the higher and middle classes, founded in 1696; 3, the Latin School, established for the education of children not belonging to wealthy families, and divided into nine classes; 4, German or Burgher Schools for boys and girls; 5, the East India Missionary Establishment; and 6, the Cansteinian Biblical Institution. This last establishment was the forerunner of Bible societies. It was founded by Baron Canstein, a German nobleman, who, after having spent a part of his life in courts and camps, became by his intercourse with Francke religiously disposed, and by his exertions and the aid of subscriptions established the biblical institution of Halle, in order to promote the reading and circulation of the Scriptures among the poorer classes. The profits derived from the sale of the Bibles and New Testaments which it prints and sells go to the support of Francke's institutions, which also derive a considerable income from lands and other charitable gifts bequeathed to them chiefly by persons who have been educated there, as well as from a bookselling, printing, and publishing establishment, which is the property of the above-mentioned institutions.

FRANCKLIN, THOMAS, D.D., was born at London in 1721. Being the son of a well-known printer, Richard Francklin, who, for his paper '*The Craftsman*,' and other services to Walpole's enemies, expected or had been promised a provision in the church for his son, he was educated at Westminster School, and thence sent to Cambridge, where he became a Fellow of Trinity College. Afterwards, while an usher in Westminster School, he gained some reputation by translations of Phalaris's '*Epistles*,' and of Cicero's '*De Natura Deorum*;' and in 1750, after a contest, he was chosen Greek professor in the University of Cambridge, an appointment to which he appears to have done as little credit by the regularity of his deportment as by his literary exertions. After having held lectureships in London, he was presented by his college in 1758 to the livings of Ware and Thundrich in Hertfordshire. Although however several sermons of his were published

during his life, and three volumes of them after his death, he was always chiefly employed in London in literary labours and literary quarrels. Among his disputes, that with Arthur Murphy was the most noted. He died in London on the 15th of March 1784. His writings were numerous and varied, but of little value. Among his original works were a poem called 'Translation,' 1753; a periodical called 'The Centinel,' intended as a continuation of 'The World,' but dropped at the twenty-seventh number; contributions to Smollett's 'Critical Review,' and one or two indifferent plays. His translations were voluminous. Several were of tragedies from the French of Voltaire and La Harpe, in the presenting of which to the stage the sources borrowed from were not always acknowledged. But the only translations of Franklin that are now remembered by any one are his 'Sophocles,' 2 vols. 4to, 1759; and 'Lucian,' 2 vols. 4to, 1780.

FRANCO, BATTISTA, called Semolei, a painter and engraver, born at Udine, according to Vasari, about 1498: he died at Venice in 1561.

Though of the Venetian state, Franco was of the Florentine school. He was a great imitator of Michel Angelo, with whose style of design he combined some of the excellences of Venetian colour. He painted much at Florence and at Rome; but he produced few easel pictures, and his works are accordingly rarely seen in galleries. His engravings or etchings are numerous, but nearly all after his own designs: they are mannered, but executed with great power. Franco was the master of Barocci.

FRANKLIN, BENJAMIN, born at Boston, in New England, January 6, 1706, Old Style, was the son of a tallow-chandler in humble circumstances, but intelligent and strong-minded. As a boy he had a great desire to go to sea; but he also displayed a fondness for reading, which induced his father to apprentice him to another son, who was a printer at Boston. His love of books, which he had now more means of indulging, weaned him from the love of the sea; and he practised great abstinence and self-denial, the better to improve his opportunities of study. At the same time he made himself an able workman. The two brothers however did not agree: the elder used an undue severity, which the younger, as he himself says, did something to provoke by his impertinence. These quarrels led to a step, which, with his usual candour, Franklin has plainly related, and declared to have been dishonourable. His indentures had, for certain reasons, been cancelled, under a private agreement that he should continue to serve for the full period of apprenticeship. A new quarrel arising, he took advantage of the letter of the law, and declared his resolution to quit his brother's service. The printer took care so to represent this matter that Benjamin was unable to find employment in Boston. He therefore went away secretly, without the consent of his parents, in 1723, and after a vain trial to find work at New York, engaged himself to an obscure printer in Philadelphia, named Keimer. There he lived frugally and creditably for a year and a half: but being induced by deceptive promises of patronage to think of setting up for himself as a master printer, he sailed for England, in the beginning of 1726, to purchase the necessary stock in trade. On his arrival he discovered that his pretended friend had neither the power nor the desire to help him; and being destitute of money or credit, he again found employment as a journeyman printer in London. His own account of this portion of his life, which offers an admirable example of frugality and industry, is very interesting. Having gained the good-will of Mr. Denham, a merchant of Philadelphia, he returned thither as that gentleman's clerk, in July 1726. He now considered his prospects to be promising: but in 1727 Mr. Denham died, and Franklin being unable to do better, returned to his old trade and his old master, Keimer. In the course of two years he gained credit and friends to enable him to set up in business on his own account; and on September 1, 1730, he married a young woman to whom, before his voyage to England, he had been attached.

Franklin had early renounced Christianity, nor does it appear, though he has unequivocally recorded his belief in God and in a future existence, that he ever again gave credence to revealed religion. About this time however a great change took place in his views. In London he had written a pamphlet to prove (we quote his words) "from the attributes of God, his goodness, wisdom, and power, that there could be no such thing as evil in the world; that vice and virtue did not in reality exist, and were nothing more than vain distinctions." Reflection on the conduct of other free-thinkers, by whom he had suffered, and on some parts of his own life, which he has candidly related and condemned, brought him to a different way of thinking; and, he says, "I was at last convinced that truth, probity, and sincerity in transactions between man and man were of the utmost importance to the happiness of life; and I resolved from that moment, and wrote the resolution in my journal, to practise them as long as I lived." This resolution he fully kept. His honesty and straightforwardness have passed unquestioned, even by the numerous enemies whom his religious and political opinions raised against him.

Unceasing industry, business-like habits, a large fund of disposable talent, general information, and readiness in the use of his pen, either for amusement or instruction, gradually secured to Franklin a large circle of friends, and raised him from poverty to affluence. He engaged in literature; edited a newspaper, wrote a pamphlet to advocate a paper currency; and in 1732 projected 'Poor Richard's

Almanac,' of which the distinguishing feature was a series of maxims of prudence and industry, in the form of proverbs. It was continued for twenty-five years, and is said to have reached a circulation of 10,000 annually. These maxims, collected in one piece, called 'The Way to Wealth,' obtained uncommon popularity, and have been translated into various languages.

Franklin's turn of mind was eminently practical. He said with truth, "I have always set a greater value on the character of a *doer* of good than on any other kind of reputation." Not that he joined in the vulgar prejudice of setting theory and practice in opposition, for he was bold, speculative, and inquiring in physical as well as in metaphysical science. But science in his hands always bore fruit directly applicable to the uses of common life; and while he never neglected his own affairs, industry and economy of time enabled him to originate, or take an active part in supporting, a variety of projects for the public good. Of these the chief were the first public library, incorporated in 1742 by the name of "The Library Company of Philadelphia," but which he set on foot and procured subscriptions for in 1732. In 1738 he established the first association for extinguishing fires; and, at a later period, the first Fire Insurance Company. In 1749 he raised subscriptions for the foundation of a public academy, the schools of Pennsylvania being few and bad. This was the origin of the present university of Pennsylvania. In 1752 he raised subscriptions and procured an auxiliary grant from the legislature to establish the first hospital in Philadelphia; a scheme suggested in the first instance by a physician of the city, who had not influence enough to work it out. In 1754 he proposed a plan for a union of the American provinces against invasion, in which a germ of the future Union may be found. It was kept alive, he used to say, like all good notions, though not carried into effect at the time. It was approved by a species of congress from six of the provinces, but rejected both by the colonial assemblies and the British government. He was also a zealous member of several societies; among them, of the Philadelphia Society for the Improvement of Prisons, and the Pennsylvania Society for the Abolition of Slavery, both founded in 1787.

As a philosopher, his name is indissolubly linked with the history of electricity, in which he was one of the most active, patient, and successful experimenters; and his industry was rewarded by that brilliant discovery, the cornerstone of his scientific fame, of the identity of the electric fluid and lightning. His attention was first turned this way in 1745, the science being then in its infancy, by the transmission of an electrical apparatus to Philadelphia, for the purpose of having the experiments which had attracted so much notice in Europe repeated in America. In 1747 he sent a series of letters to England, in which he noted the power of sharp points both to attract and to give out electric matter; and explained his theory, that instead of the phenomena observed being produced by two different electric fluids, they arose from the effort made to restore an equilibrium when one body was overcharged, and another undercharged, with electricity. A body in the former state he called positively, in the latter state negatively electrified. This theory he used to explain the action of the Leyden jar; and though not universally admitted, it at least furnishes a simple and satisfactory explanation of the phenomena of the science. In 1749 he had conjectured the identity of lightning and electricity, and suggested the idea of protecting houses by pointed conductors, but did not prove it till 1752. He was waiting for the erection of some lofty building, upon which an insulated iron rod might be placed, in hope that on the passage of a thunder-cloud overhead, sparks might be taken from the rod, as from a charged conductor, when it occurred to him that by flying a kite, pointed with iron, during a thunder-storm, the matter of lightning might, if his views were correct, be drawn down the string. He tied a key to the end of the hempen string, insulated the whole apparatus by adding a piece of silk to the end next the hand; and the experiment succeeded. Sparks were taken from the key, a Leyden jar was charged, and the phenomena exhibited were identically the same as if an electrical machine had been used instead of the kite. He varied the experiment by fixing an insulated iron rod at the top of his house; and immediately proceeded to turn his discovery to account by publishing a plan for defending houses from lightning by the use of pointed conductors.

His character, in reference to this branch of his pursuits, has been described in the following terms by Sir H. Davy: "A singular felicity for induction guided all his researches, and by very small means he established very grand truths. The style and manner of his publication (on Electricity) are almost as worthy of admiration as the doctrine it contains. He has endeavoured to remove all mystery and obscurity from the subject. He has written equally for the uninitiated and for the philosopher; and he has rendered his details amusing as well as perspicuous, elegant as well as simple." ('Life,' by Dr. Davy.)

To Franklin's other scientific labours we can only allude. They treat of many branches of meteorology, maritime phenomena, ship-building and various subjects connected with navigation, as the Gulf Stream, and the effect of oil in stilling waves; of the proper construction of stoves and chimneys, which, to use a common phrase, seems to have been one of his hobbies; of the art of swimming, which, being himself an excellent swimmer, he was anxious to recommend as

a universal branch of education: subjects consonant to his practical character, and most of them directly applicable to the increase of human comforts. Papers on these matters nearly fill the second volume of his collected works; his electrical treatises and letters occupy the first volume; and his moral, historical, and political writings the third.

To return to Franklin's private history: the increasing estimation in which he was held, was manifested in his successive appointments to different offices. In 1736 he was made clerk to the General Assembly of Pennsylvania; in 1737 postmaster of Philadelphia; in 1747 he was elected as one of the representatives of Philadelphia in the Assembly; in 1753 he was appointed deputy postmaster-general for the British colonies.

When he first became a member of Assembly, that body and the proprietary governors, Penn's representatives, were in hot dispute, chiefly with respect to the immunity from taxation claimed by the latter. In this Franklin took an active part. "He was soon looked up to as the head of the opposition, and to him have been attributed many of the spirited replies of the Assembly to the messages of the governors. His influence in that body was very great. This arose not from any superior powers of eloquence; he spoke but seldom, and he never was known to make anything like an elaborate harangue. His speeches often consisted of a single sentence, or of a well-told story, the moral of which was always obviously to the point. He never attempted the flowery fields of oratory. His manner was plain and mild. His style in speaking was like that of his writings, simple, unadorned, and remarkably concise. With this plain manner, and his penetrating and solid judgment, he was able to confound the most eloquent and subtle of his adversaries, to confirm the opinion of his friends, and to make converts of the unprejudiced who had opposed him." ('Life,' p. 115.) Having thus shown his talents, he was sent to England in 1757, on the part of the Assembly, to manage the controversy before the privy council, and was successful: it was decided that the estates of the proprietaries ought to pay their fair proportion of the public burdens. He remained in England after this question was settled, as agent for Pennsylvania; and his conduct was so highly approved that Massachusetts, Maryland, and Georgia, severally appointed him their agent. By this time his name was well known to European philosophers. He was chosen a member of the Royal Society, and of several foreign scientific bodies at a later period; in 1772 he was made a foreign associate of the Académie des Sciences, and the universities of Oxford, Edinburgh, and St. Andrews, admitted him to the degree of D.C.L. On his return to America, in 1762, he received the thanks of the Assembly, "as well for the faithful discharge of his duty to that province in particular, as for the many and important services done to America in general during his residence in Great Britain."

Being re-elected a member of Assembly, Franklin was earnest in endeavouring to procure a change in the government, by vesting directly in the king those rights and powers, which were held mediately by the proprietaries, to the injury, as he thought, of the community. Party spirit ran high on this point; and the friends of the proprietaries had influence enough to prevent his election in 1764. On the meeting of the Assembly however he was re-appointed provincial agent in England. He was a warm opponent of the Stamp Act: and his examination at the bar of the House of Commons in 1766, when the repeal of that unhappy measure was proposed, shows the minuteness, variety, and readiness of his information. (See his Works, vol. iii., p. 245.) In the outset of the contest he is said to have been truly desirous of effecting a reconciliation between the mother country and the colonies. The rough treatment which he experienced in the course of his negotiations is reported to have changed his temper. That he should have been deprived of his postmastership, is not wonderful. On one occasion, before the privy council, being assailed by Wedderburne, then solicitor-general, in a torrent of personal abuse, which was received with evident pleasure by the council, he bore it in silence, and apparently unmoved. On changing his dress however he is reported to have said, that he never again would wear that suit till he had received satisfaction for that day's insult. His next appearance in it was on the day when, as minister of the United States, he signed the treaty by which England recognised the independence of the colonies.

In 1775, perceiving that there was little chance of a reconciliation being effected, he returned to Philadelphia, and the day after he landed, was elected a delegate to the Congress then assembled in that city. His character and services marked him out for the most important employments during that and the following year: among them he was sent on a fruitless mission to persuade the Canadians to join in the insurrection; and was appointed president of the convention assembled at Philadelphia, for the purpose of remodelling the government of Pennsylvania. Towards the end of 1776 he was sent to France, where in conjunction with his brother minister, Silas Deane, he succeeded in inducing the French Government to form an offensive and defensive alliance with the United States, Feb. 6, 1778. Having made several journeys to the Continent in his former visits to Europe, he was already known in person as well as by reputation to the scientific and literary men of France, by whom he was received with the highest marks of respect. Nor did his political engagements prevent his bestowing some share of his attention on science. He

bore a part in exposing the frauds practised under the name of animal magnetism. In 1785 he was recalled, at his own wish, and was succeeded by Jefferson. Soon after his return he was chosen member of the supreme executive council for the city of Philadelphia, and in a short time was elected president of the same. In 1787 he was delegate for the state of Pennsylvania, in the convention appointed to revise and amend the Articles of Union, and his last political act was an address to his colleagues, entreating them to sacrifice their own private views, for the sake of unanimity in recommending the new constitution, as determined by the majority, to their constituents.

After enjoying, through a long life, an unusual share of health, the just reward of temperance and activity, Franklin was compelled in 1788 to quit public life, by the infirmities of age. But he still retained his philanthropy undiminished, and his intellect unclouded; and his name appears, as president of the Abolition Society, to a memorial to Congress, dated February 12, 1789, praying them to exert the full extent of power vested in them by the constitution in discouraging the traffic in men. This was his last public act. Still he preserved his liveliness and energy, during those intervals of ease which a painful disease, the stone, afforded to him. This however was not the proximate cause of his death. He died, after a short illness, from disease of the lungs, April 17, 1790, aged eighty-four.

Dr. Franklin's published works were collected in three volumes, with his fragment of his own life, continued by Dr. Stuber, prefixed. He bequeathed his papers to his grandson, William Temple Franklin, by whom, after long delay, an excellent 'Life of Franklin,' including many of his miscellaneous writings, and much of his correspondence, was published. The 'Biog. Universelle' contains a long memoir of him by Biot; and his character and conduct have employed the pens of several of the most distinguished Americans of the present day. The latest and best life of Dr. Franklin is that by Mr. Jared Sparks, prefixed to an edition of the Works of Franklin, in 10 vols. 8vo.

WILLIAM FRANKLIN, the natural son of Benjamin Franklin, and his only son who survived childhood, born at Philadelphia in 1731, took, at the commencement of the revolutionary struggle, the opposite side to his father, and during the whole of the war of independence remained a steadfast loyalist. He held early in life the office of postmaster of Philadelphia; and in 1763 was made Governor of New Jersey, an appointment he retained until 1776, when a new governor was elected by the popular vote, and Governor Franklin was arrested and sent prisoner to Connecticut. He was treated with considerable harshness, but, after some two years had passed, was exchanged, and removed to New York, then held by the English army. Here he became president of the 'Board of Loyalists,' and took an extremely active part in furthering every effort made by the loyal party. When the English were obliged to evacuate New York, William Franklin took refuge in England, where he met with a favourable reception from the king and the government, and received a handsome pension, on which he resided in this country till his death, November 1813. From the moment of his accepting the governorship of New Jersey his father broke off all intercourse with him, and though William Franklin sought a reconciliation when the cause of their original quarrel was removed, there was no renewal of cordial feelings. Franklin indeed promised to forget, but in his will he bequeathed but a trifling sum to his son, assigning as a reason "the part he acted in the late war."

FRANKLIN, REAR-ADMIRAL SIR JOHN, was born in 1786 at Spilsby in Lincolnshire. His ancestors were substantial yeomen, and his father inherited an estate in that county, which though small was sufficient to give him local rank as a landlord. Unhappily however the property was so embarrassed that he was obliged to sell it, and he became entirely dependent on his commercial profits for the maintenance and education of twelve children, some of whom, besides the subject of this memoir, attained considerable rank and reputation. One, Sir Willingham Franklin, became judge at Madras, and another, Major James Franklin of the Bengal Service, was highly distinguished for his scientific acquirements, which procured him the Fellowship of the Royal Society.

John, the youngest son, early evinced a great predilection for a sea-life. There is a story told of him which seems to rest on more than mere traditional evidence. When a school-boy at Louth in Lincolnshire, he availed himself of a holiday to walk to the coast, a distance of twelve miles, in order to see the ocean, on which he gazed with wonder and delight for many hours. His father, who was extremely desirous that his son should follow any other profession than that of a sailor, conceived that by sending him in a small merchant-ship to Lisbon, the discomforts of the voyage would effectually cure the lad of his love for the sea; but it had a totally different effect; and accordingly perceiving that he was bent on a naval profession, he was entered as midshipman on board the Polyphemus at the age of fourteen, and was in that ship in the celebrated battle of Copenhagen, from which he escaped without a wound, whilst a brother midshipman was killed at his side.

He next joined the Investigator, under the command of Captain Flinders, his cousin by marriage, with whom he sailed on a voyage of discovery to the coasts of Australia. During this expedition, which combined investigations into natural history with geographical discovery, young Franklin had abundant opportunities—which were

not neglected—of acquiring much valuable knowledge. Besides sound practical seamanship he learned the more theoretical and difficult branches of nautical surveying, and was always one of the midshipmen selected to attend the Captain whenever he made excursions in boats, or visited the shore for scientific purposes. After some time the Investigator being unfit for further service, the officers were ordered home in the Porpoise. In this ship he was wrecked on a coral reef off the Australian coast, and with 94 persons spent nearly two months on a narrow sandbank only a few feet above the sea-level, whilst Captain Flinders proceeded to Port Jackson for relief.

Having fortunately escaped the fate of his chief, who on his voyage home was unjustly detained as a prisoner in Mauritius, Franklin proceeded to Canton with Captain Fowler, who had charge of the Porpoise, and embarked on board the Earl Camden, commanded by Sir Nathaniel Dance, for the purpose of returning to England. This ship and other Indiamen were attacked by the French admiral, Linois, in the Straits of Malacca, but Sir Nathaniel Dance gallantly defeated his antagonist. During the engagement Franklin acted as signal midshipman, and was of considerable service in other ways.

Shortly after his arrival in England he was appointed to the Bellerophon, Captain Laing, and had the charge on board that ship of the signals during the memorable battle of Trafalgar. It is recorded that he performed this important duty with singular coolness and intrepidity, although many of his brother officers were shot around him. Indeed, out of forty companions, only seven, of whom he was one, came out of the battle unscathed. He now served for two years with the Channel fleet and Rochefort squadron, and then joined the Bedford, in which ship he was present at the blockade of Flushing,—off the coast of Portugal,—on the Brazil station,—and at the attack of New Orleans in 1814. Here he greatly distinguished himself in a gun-boat action, in the course of which he received a slight wound. For his gallant conduct on this occasion he was promoted to the rank of lieutenant.

Peace having been established, the attention of Government was turned to Arctic discovery, which had been interrupted during the long war, and in 1818 commenced the brilliant and remarkable series of Arctic expeditions with which Franklin's name is so honourably associated. The scientific knowledge he had acquired when serving under Captain Flinders was now of great benefit to him, and Sir Joseph Banks, who at that time presided over the Royal Society and who took great interest in Arctic matters, recommended him to the Admiralty as a proper officer to be employed in Arctic exploration. Accordingly Franklin commenced his Arctic career by commanding the Trent, which ship, with the Dorothea, commanded by Captain Buchan, formed an expedition appointed to sail from Spitzbergen across the supposed Polar Sea.

Unhappily the Dorothea in lat. 80° 34' N. became disabled, but Lieutenant Franklin, with a gallant disregard of danger, earnestly requested to be allowed to proceed alone in the execution of the service. The nature of Captain Buchan's instructions prevented this, and the ships returned to England.

Franklin's conduct and aptitude for the peculiar service of Arctic enterprise brought him into prominent notice, and he was intrusted in 1819 with the command of his first overland expedition for the purpose of tracing the coast-line of the North American continent, at that time very imperfectly known. Descending the Coppermine the party surveyed a large portion of the coast east of the mouth of that river, during which they underwent frightful privations and trials, the history of which, as told in Franklin's own manly and unaffected language, is undoubtedly one of the noblest pictures of heroic exertion and patient endurance ever presented for our admiration. The results of the labours of Franklin and of his distinguished associate Sir John Richardson, in this memorable journey, deserve more full and fitting recognition than can be attempted on this occasion: the party travelled 8550 miles, mostly over ground previously unknown, and large acquisitions were gained for science by the careful study of the physical geography and natural productions of the North American continent.

For his services on this occasion he was promoted to the rank of captain, having while absent risen from lieutenant to commander. In 1823 he was elected a Fellow of the Royal Society, and served on the council of that body.

Undeterred by the appalling sufferings he had already undergone, Franklin, although lately united in marriage to the youngest daughter of William Porden, Esq., again volunteered his services for Arctic exploration. These were accepted, and in 1825 he left England on his second land exploration. Descending the Mackenzie River, he traced the North American coast from the mouth of the Coppermine River to the 150th meridian. For these fresh services he received the honour of knighthood, and had the degree of D.C.L. conferred on him by the University of Oxford. He also received the Gold Medal from the French Geographical Society, and was elected a Corresponding Member of the Institute of France.

Sir John Franklin now remained at home two years, when he was appointed to the Rainbow, and served in that ship in the Mediterranean for three years. He was chiefly employed in the Greek waters, and had the good fortune to be of considerable service in the delicate adjustment of complicated diplomatic relations. It is worthy of remark, as illustrative of the amiability of Franklin's character, that

the sailors who then served under him named the ship the 'Celestial Rainbow' and 'Franklin's Paradise.' During this period, as indeed on all other occasions, he eagerly availed himself of every opportunity, not only to improve his knowledge of geology, to which science he was greatly attached, but also used every exertion to add to the museum of the Geological Society, and to the private collections of scientific men.

After a brief period of rest which followed his services in the Mediterranean, he applied to Lord Glenelg for employment under the Colonial department, and his lordship in a very complimentary manner offered him the important post of Governor of Van Diemen's Land, which he held for seven years. During this time that colony received convicts, New South Wales having ceased to be a penal settlement. This rendered Sir John Franklin's position most onerous and trying, but he acquitted himself so entirely to the satisfaction of the colonists, that in grateful remembrance of his government, which was marked by the establishment of a college and a philosophical society, they, unsolicited, subscribed 1600*l.* towards the expenses of a private expedition fitted out for his rescue.

It might be supposed that, after so long a period of laborious services, Sir John Franklin would have desired repose, particularly as he had now attained high renown; but his wishes still pointed towards active employment, and consequently, when the Arctic expedition was contemplated, which has cost him his life, he was willing to take the command, when the Admiralty were of opinion that he was the officer best fitted to act as chief. That expedition was originated by the late Sir John Barrow, secretary to the Admiralty, who submitted a plan for the discovery of the North-West Passage to government, which, after having been referred to the council of the Royal Society, was adopted.

The expedition, consisting of the Erebus and Terror, which had recently returned from a voyage of discovery in the Antarctic sea, left England in May 1845. Unhappily its history and fate are still veiled in obscurity: this however we know, that everything was done to render it efficient; that the officers under Sir John Franklin were men of experience and zeal, and that the last accounts received from them represent their commander animated by all the ardour and spirit which characterized his early Arctic exertions.

It would have been unjust to have expected less from such a man, and as his instructions contained the usual discretionary power given in these documents, there is too much reason to fear that he fell a victim to his daring attempts to achieve success. It will ever be a matter of regret, though it cannot be of surprise, that the discovery of traces of the Erebus and Terror at the entrance of Wellington Channel caused the search for our countrymen to be directed principally to the north and west of Barrow's Straits; because, although the information brought home by Dr. Rae in 1854, to the effect that Esquimaux had seen the bodies of forty white men in the spring of 1850 on what is supposed to be Montreal Island, at the mouth of the Fish River, cannot be regarded as trustworthy; yet the relics of the expedition procured by Mr. Anderson and Dr. Rae suffice to prove that Franklin's ships must have been beset within an area comprised within the 70th and 72nd parallels of latitude and the 97th and 100th meridians.

This fact leads to the conclusion, which no biographer of Franklin can overlook, that although government has rewarded Sir Robert McClure for discovering a North-West Passage, another passage, and the only navigable one, was previously discovered by Sir John Franklin. This is the opinion of Sir Francis Beaufort, the late eminent hydrographer, and of his successor, Captain Washington, and also of Franklin's old associate in Arctic adventure, Sir John Richardson, and other well-known Arctic voyagers. Thus should the efforts prove unsuccessful, which will assuredly be made by Lady Franklin, if not by government, to ascertain the precise fate of Sir John Franklin and his companions, sufficient is known to warrant the addition to Franklin's many high qualities and titles of renown on the monument which is about to be erected to his memory in Lincoln—that of his having been the first discoverer of a North-West Passage.

FRANZÉN, FRANS-MICHAEL, an eminent modern Swedish poet and prosaist, was born on the 9th of February 1772 at Uleaborg, in Finland, at that time a province of the Swedish crown. Finland, both before and since its compulsory union with Russia, has been fruitful of poets to Sweden, though possessed of a language of its own of an entirely different character. Raneberg, at present the head of Swedish poetical literature, is a Finn, and the first effort of Franzén that attracted attention was his poetical eulogy on Creutz, also a Finn, who combined the unusual characters of a poet and a diplomatist, and passed much of his life as ambassador at Paris. The 'Atis and Camilla' of Creutz had introduced an ease and elegance, before unknown, into Swedish poetry, and the eulogy on its author by Franzén produced a commotion in the literary world of Stockholm, by the originality and vigour of its tone, which was in strong contrast to that of the school of Leopold, then dominant, who was an ingenious imitator of French models. The eulogy obtained, in spite of its originality, the great prize of the Swedish Academy. This was in 1794, at which time, and for nine years previous, Franzén had been a student at the Finnish university of Abo. In the following year he set out on a tour to Denmark, Germany, France and England, and

chanced to be a witness of the great fire of Copenhagen, which destroyed a third part of the city. In Paris he ventured on a piece of composition in French verse, which was printed in a French periodical, and which he reprinted thirty years afterwards in the introduction to his Swedish poem, founded on a tale of the revolution, 'Julie de St. Julien.' During his absence he was elected librarian to the University of Åbo, and afterwards professor of literary history. After the transfer of Finland to Russia by the war of 1809, he resolved to remove to Sweden, where he remained for the rest of his life. At first he officiated as pastor of Kumla, in the diocese of Strängnäs, a parish remote from the capital, but he was afterwards minister of the church of Clara at Stockholm, where the poet Chorus had preceded him; and in 1834 he was chosen Bishop of Hernösand. While still a resident in Finland, he had been chosen one of the eighteen of the Swedish Academy, a distinction of the same importance for a literary man in Sweden, as to be a member of the Royal Academy here for an artist in England. In 1824 he became its secretary, and remained so for ten years, during which it was part of his duty to write a series of biographical notices, which were much admired for their literary merits. He appears to have resigned the secretaryship on his elevation to the bishopric, which he held till his death in October 1847. Laing in his travels in Sweden gives an account of his meeting with Bishop Franzén on board of a steam-boat, when going on a visit to his northern diocese, and speaks of the general affection and veneration with which he was regarded.

Archbishop Wallin, Bishop Tegnér, and Bishop Franzén were three of the most distinguished poets of Sweden in the present century. They were all three associated in the new Swedish version of the Psalms, to produce which a commission was appointed in 1814, and respecting the excellence of which there is but one voice, it being generally regarded as the best in Europe. It is singular that so little reference has been made to this fact in the frequent discussions that have taken place on the expediency of obtaining a new poetical version of the Psalms in English. The poetical works of Franzén were collected in five volumes at Örebro in 1824 and subsequent years. The most successful are decidedly the songs and shorter pieces, many of the songs enjoying a high popularity both in Sweden and Finland. Their prevailing character is sweetness. The longer narrative poems, one of which 'Sten Sture,' extends to twenty cantos and fills an octavo volume, are of a somewhat dry simplicity, both of style and incident, approaching far too nearly to the level of prose. Franzén was regarded by Swedish writers as belonging to neither of the two rival schools of poetry in his time and country, the 'Academic' or Classical, and the 'Phosphoric' or Romantic, but as standing at the head of a third or neutral party. His sermons, of which four volumes were published, are unusually animated; he was also the author of some controversial writings against the doctrines of the Rationalists, called forth by the controversy respecting Strauss's 'Life of Jesus.' The biographical sketches from his pen already mentioned have been collected under the title of 'Minnesteckningar.' In the introductory speech before the Swedish Academy prefixed to them, the reader remarks a tone of courtly deference in speaking of Charles XIII., and even of the Russian government, to avoid living under which he left Finland, the absence of which would perhaps have inspired a higher notion of the dignity of Franzén's character.

FRASER, SIMON. [LOYAL, LORD.]

FRÄUNHOFER, JOSEPH, a distinguished optician of Bavaria, was born at Straubing in that kingdom, in 1787, of parents in humble life; and by their death he was left an orphan when eleven years of age.

He had been accustomed to labour from his childhood, and he was early engaged as an apprentice to a manufacturer, who exacted from him an unremitting attention to the mechanical operations connected with his calling; yet the youth found means, without the aid of an instructor, to supply in a certain degree the deficiencies of his education, and to make some progress in the study of mathematics.

An accident, which nearly cost him his life, was the cause that the merit of Fraunhofer became known: an old house in which he lodged fell down one day and buried him in the ruins; he was extricated, however, and happily came out unhurt. The interest excited by the danger which the young man had escaped drew upon him the notice of several persons of rank and fortune; and these, being struck with admiration on discovering the efforts he had made in the midst of many adverse circumstances to cultivate the sciences, procured for him an introduction to the celebrated Reichenbach, who received him, he being then about twenty years of age, into the great manufactory for the construction of mathematical and philosophical instruments which he had established at Benedictbeuern, near Munich. In this situation Fraunhofer had ample scope for the exercise of his talents; and he distinguished himself as much by his inventive genius as by his skill in executing the mechanical processes on which he was employed. Enabled now to study optics as a science, he used the means at his disposal to make many important experiments on light, and to construct instruments of superior kinds for celestial observations. By his discoveries and improvements he greatly increased the reputation of the establishment to which he belonged; and at length it became his own property.

Fraunhofer was a member of the University of Erlangen and of the

Royal Academy of Sciences at Munich; and in 1822 this academy appointed him keeper of the Museum of Physics. The king of Bavaria conferred on him the order of Civil Merit, and the king of Denmark that of Danebrog. He died in 1826, in the thirty-ninth year of his age.

His most remarkable discovery was that of the existence of a series of dark lines in the spectrum produced by the refraction of the sun's light in a prism of glass or other transparent medium. The prisms were formed of a material free from veins, and in the experiments they were disposed so that the light entered and emerged at equal angles with their sides, by which means each of the coloured spaces in the solar spectrum on the screen were homogeneous: on examining these with a telescope it was perceived that they contained many black lines parallel to one another and to the breadth of the spectrum; and Fraunhofer ascertained that they amounted in number to about 354; Sir David Brewster has since discovered many more. By means of a theodolite he measured the angular distances between the most strongly marked of these lines in every two of the differently coloured spaces in the spectrum produced by each of the prisms employed in the experiments; and thus he was enabled to determine with great accuracy the indices of refraction for the mean rays of the prismatic colours in each of the media of which the prisms were formed, as well as the dispersive powers of those media. He observed similar black lines in the spectra of the moon, Mars, Venus, and some of the fixed stars; also in the spectra formed by the two polarised pencils produced by a prism of Iceland spar. An account of the observations on spectra was published in a pamphlet entitled 'Bestimmung des Brechungsvermögens und der Dispersion verschiedener Glasarten in B-zug auf die Vervollkommenung achromatischer Fernrohre,' 4to, Munich, 1815. Fraunhofer also made many highly curious and interesting experiments on the phenomena arising from the interference of light in passing through small apertures of different forms, and through wire gratings. An account of these experiments on the inflexion of light was published in 4to, at Munich, under the title of 'Neue Modifikation des Lichtes durch gegenseitige Einwirkung und Beugung der Strahlen und Gesetze derselben.'

Fraunhofer executed an equatorially-mounted telescope for the observatory at Dorpat. The diameter of the object-glass is nearly 10 inches, and its focal length about 16 feet; it consists, as usual, of a convex lens of crown glass, and a concave lens of flint glass, but the materials were compounded by himself, and the performance of the instrument is said to be superior to that of any which had been made before. A description of the telescope is given in the 'Astronomische Nachrichten,' Nos. 74, 75, 76, with a memoir on the refractive and dispersive powers of different kinds of glass. In the same work is a memoir by Fraunhofer on halos, parhelia, and the like phenomena: in this he ascribes the formation of the small solar and lunar halos to the inflexion of light in the vapour of the atmosphere; and that of the larger kind to the refraction in hexagonal prisms of ice.

FREDERICK I., Emperor of Germany, surnamed BARBAROSSA, was born in 1121, and succeeded his uncle Conrad III. on the imperial throne in 1152. Though Conrad was not deficient, either in warlike spirit or in talents, an unhappy concurrence of circumstances had prevented him from regulating, as might have been wished, all the domestic and foreign concerns of the empire. So many important affairs, both in church and state, demanded immediate attention, so many difficulties were to be overcome, that it required a man of no common energy to accomplish such a task; and of this Conrad himself was so sensible, that he did not recommend to the princes of the empire his young son Frederick, but his nephew Frederick, son of Frederick duke of Suabia, by Judith daughter of Henry duke of Bavaria, who had already given proofs of his personal courage. Accordingly on the 17th day after the death of Conrad, Frederick was unanimously chosen his successor by the temporal and ecclesiastical princes assembled at Frankfurt, and crowned at Aix-la-Chapelle five days after. In the second year of his reign, Frederick settled the dispute between Canute and Sueno, competitors for the Danish crown, in favour of Sueno, whom he however compelled to do him homage as his vassal. But his chief attention was directed to Italy. Complaints were made by the Apulians against Roger king of Sicily; and some citizens of Lodi also came, and represented in strong colours the tyrannical conduct of the Milanese. Frederick sent an envoy with a letter, enjoining the Milanese to refrain from such proceedings, but they tore his letter to pieces, and his envoy saved his life by timely flight. This and other important considerations called him to Italy in 1155, where he held an assembly in the plain of Roncaglia, to receive the homage of most of the great Italian lords and principal cities. In this, his first expedition into Italy, he in some measure humbled the Milanese, but not choosing to attack their city took the road to Turin, received on the way the submission of many cities, and in particular inflicted severe chastisement on Asti. Having taken Tortona, after a two months' siege, he allowed the inhabitants to retire, but gave the place up to plunder, after which it was entirely burnt and destroyed. After being crowned king of Italy at Pavia, he advanced rapidly towards Rome, where Adrian IV. had just succeeded Pope Anastasius. The city having been excited by Arnold of Brescia to dispute the authority of the pope, Adrian, who was a man of great resolution, excommunicated Arnold and his partisans,

who were in consequence expelled by the Roman senate, and Arnold being subsequently taken prisoner, was by the emperor delivered up to the pope, who caused him to be burnt alive. Having had an interview with the pope, at which he consented to hold his holiness's stirrup, and having re-established his authority at Rome, and received the imperial crown from his hands, Frederick set out on his return to Germany. His first care was to restore the peace of the empire, which was disturbed by a dispute between the Archbishop of Mentz, and the Count Palatine of the Rhine; he likewise ended, to the satisfaction of all parties, a most important question respecting the duchy of Bavaria. He had resolved to divorce his consort Adelaide, because she had no children; but this not being a sufficient ground for a divorce, the plea of consanguinity was set up, and a sentence of divorce was pronounced by Cardinal Joseph Orsini and several prelates. Frederick then proposed to marry a Greek princess, but this negotiation failing, he married in 1156 Beatrice, heiress of Burgundy, by which alliance he annexed that rich kingdom to his dominions. Frederick soon afterwards compelled Boleslaus duke of Poland to acknowledge himself a vassal of the empire, and in the first six years of his reign restored the empire to the same power and extent of dominion which it had under Henry III.

The affairs of Germany being settled, Frederick found it necessary again to go to Italy, where the Milanese cruelly oppressed the towns which would not submit to their orders. In 1158, Frederick with an army of 100,000 infantry and 15,000 cavalry laid siege to Milan, and the inhabitants, notwithstanding some previous successes, were reduced, after an obstinate resistance, to offer submission, which was accepted. But they again rebelled, and Frederick resolved to make an example of this haughty city, which was closely invested and compelled to surrender at discretion. Frederick's decision was that "Milan should be a desert; that all the inhabitants should leave the city in a week, and settle in four villages, ten miles distant from each other." It has been often asserted that the city was raised to the ground, with the exception of the churches: but this seems to be an exaggeration. The city was not plundered; the order or permission for the work of destruction extended only to the fortifications, and even of these a considerable part was left standing. But the power of Milan was broken. Its fall entirely discouraged the other cities. Brescia and Piacenza were obliged to demolish their walls; and the other cities which had joined in the insurrection were deprived of their rights and privileges.

While Frederick was thus engaged, Pope Adrian, with whom he was latterly on very bad terms, died, on which a schism arose; some of the cardinals choosing Victor IV., who was inclined to the imperial interests, and the others Alexander III. Frederick, who considered himself as protector of the Church, called a council at Pavia. Alexander not recognising this council, which consisted of fifty or sixty German and Italian bishops, it proclaimed Victor IV. as the true pope, who was acknowledged by the emperor. Alexander excommunicated the emperor and all his partisans; but though he was recognised by the kings of France and England and the estates of Lombardy, Frederick's superiority obliged him to seek refuge in France. When the emperor returned to Germany he found that dissensions had broken out between several of the princes, which he however succeeded in appeasing; and then set out to meet Louis the Young, king of France, at Launois, near Dijon, where they had agreed that a council should be held to terminate the schism in the church, by deciding between the two popes, who were to appear, accompanied by the two sovereigns, their protectors. This plan however failed. The death of Pope Victor IV. in 1164 seemed to offer a favourable opportunity for reconciliation between Frederick and Alexander III., which the former was inclined to embrace; but before his orders reached Rome his ambassador there had concerted with the cardinals to proceed to the election, and the choice fell on Guido, bishop of Crema, who took the name of Paschal III., and was acknowledged by the emperor. Frederick crossing the Alps in 1165 marched direct to Rome, where Paschal was solemnly installed, and then crowned the emperor and his consort Beatrice. The power of the emperor now seemed to be greater than ever, and he hoped entirely to reduce the cities of Lombardy, which had formed a powerful league, being roused by the cruelty and boundless extortion of his officers, even in those places where his authority was acknowledged. Frederick's plans were however defeated by a pestilential disorder, which carried off the greater part of his army, and it was with no little difficulty that he returned in 1168 from his third Italian campaign as a fugitive. He remained six years in Germany to settle the very complicated affairs of that country, where the ambition of the several princes led to continual disputes and feuds, the most important of which was the conflict between Henry, surnamed the Lion, and many princes, bishops, and counts, who formed a confederacy against him. Henry however defeated them, and soon afterwards married Matilda, daughter of Henry II., king of England. In 1169 Frederick prevailed on the princes of the empire to choose his son Henry, who was only five years old, king of the Romans, and he was accordingly crowned at Aix-la-Chapelle. Having appeased the disorders in Saxony, and undertaken a successful expedition against Boleslaus, duke of Poland, he prepared for the fourth time to cross the Alps. The negotiations in Italy had not led to any favourable results. Soon after

Frederick's return to Germany, Pope Paschal died, and the cardinals in the interests of the emperor chose for his successor Calixtus III., a man very inferior in talent to Alexander; but the latter had so consolidated his power, that Frederick thought he should gain more by opposing an anti-pope to him than by attempting a reconciliation. The cities of Lombardy, encouraged by Alexander, extended their confederacy, and built a new city, which they called Alexandria, in honour of him. Only Genoa and Pisa remained true to the emperor, who, to prevent matters from going too far, sent Christian, archbishop of Mentz, with a small army to Italy. The archbishop was equally distinguished as a prelate, a statesman, and a general; but he was not able to effect much towards the establishment of peace. The emperor himself having passed Mount Cenis, laid siege to Alexandria, and the united Lombard army came to its relief. Negotiations were however opened, and a truce concluded. The emperor was so sure of the result that he sent part of the army back to Germany, which he soon had reason to repent. The Lombards grew bolder, and Henry the Lion, notwithstanding all the entreaties of the emperor, refused to proceed. A battle soon took place near Legnano, in which the emperor was defeated by the Lombards with great loss, and he himself being overpowered and supposed to be killed, his troops fled. A few days afterwards however, to the unspeakable joy of the army, he appeared again at Pavia, where the empress had already put on mourning.

This loss induced Frederick to think of peace. He treated first with Alexander, whom he acknowledged as pope, and who relieved him from the ban of excommunication. He then, by the mediation of Alexander, concluded a treaty, or rather a truce, for six years, with the cities of Lombardy, on very advantageous terms, for he in fact lost nothing essential, except that he gave up the cause of Calixtus, who obtained a rich abbey. On his return from Italy, where he passed the winter, he went to Burgundy, called a diet at Arles, and had himself and his consort crowned king and queen of Burgundy; whence he returned to Germany much sooner and more powerful than his enemies expected. The peace of the empire being established, the princes and bishops who had sided with Alexander became reconciled to the emperor; but new troubles arose in Saxony. Henry the Lion formed great plans to extend his power, but was in the end forced to sue for peace. At Erfurt he appeared before the emperor and the German princes, to whom Frederick had made a promise to decide nothing respecting Henry without their approbation. The sentence was that he should be relieved from the ban of the empire, retain his family dominions of Brunswick and Lüneburg, but for the preservation of peace, should go into banishment for seven years, which, at the intercession of the pope and the king of England, was reduced to three years. Henry accordingly went with his wife and children to his father-in-law the king of England.

The truce with Lombardy now approached its last year. After several occurrences in Italy, not unfavourable to Frederick, Alexander III. died in 1181, and was succeeded by Lucius III., who was much inferior to him in ability and energy. The hostile dispositions of both parties had greatly abated during the wars; and the emperor having summoned a diet of the empire at Constance, a definitive peace was concluded, honourable and satisfactory to all parties. A year after the peace of Constance, order and tranquillity everywhere prevailing, the emperor called a general diet at Mentz, one object of which was to establish his five sons. This diet presented a scene of unrivalled festivity and splendour. The Empress Beatrice, the emperor's five sons, the archbishops, bishops, princes and nobles of Italy and Germany, ambassadors from foreign sovereigns, 40,000 (some say 70,000) knights from all parts of Europe, and countless multitudes of people of all classes were here assembled. Historians have recorded those brilliant days, the wonders of which have been handed down from generation to generation, and songs composed on that occasion are still sung on the banks of the Rhine. A year after this diet Frederick again went to Italy, where he was received with extraordinary honours by the cities of Lombardy, and even concluded an alliance with Milan. But new disputes arose with the papal see, through Frederick's refusal to grant to Lucius, and afterwards to his successor Urban III., the sovereignty of the territory called 'St. Peter's Patrimony.' He however so increased his power in Italy by the marriage of his son Henry with the daughter and heiress of William, king of Sicily, that the pope did not venture to proceed to extremities. In Germany Frederick had declared Lubeck and Ratibon imperial cities, and thereby had laid the foundation of a middle estate between the princes and the emperor, by which the power of the latter was increased, and the class of citizens elevated. The separation of Bavaria from Saxony, which Henry the Lion had possessed together, added indeed to the power of the emperor, but embittered the animosity between the party of the Guelphs and Ghibelines.

Things were in this state when all Christendom was alarmed by the news of the taking of Jerusalem by the infidels. This event led to the Third Crusade. On the exhortation of the pope, Frederick took the cross in 1188, with his son Frederick and a number of the principal German nobles. Upon mature deliberation it was resolved that the army should go by land through Germany, Hungary, and Asia Minor. The army, consisting of 150,000 men, besides many thousand volunteers, commenced its march in the spring of 1189. Though it

met with many difficulties, chiefly from the perfidy of the Greek emperor, who had secretly made a convention with Saladin and the sultan of Iconium to obstruct the passage of the Germans, Frederick penetrated into Asia, gained two victories over the Turks near Iconium, which he took, and was proceeding in his victorious career to Syria, when his eventful life was brought to a close in 1190, in an attempt to swim on horseback across the river Calycadnus, where he was carried away by the current. The statement that he was drowned in the Cydnus while bathing is certainly incorrect.

Frederick was a brave and liberal prince, equally firm in prosperity and adversity. These great qualities veiled the pride and ambition which were unquestionably in part the motives by which he was actuated. He possessed an extraordinary memory, and a greater extent of knowledge of different kinds than was common in that age. He esteemed learned men, especially historians, and wrote in Latin memoirs of some part of his own life, which he left to Otho, bishop of Freysingen, whom he appointed his historian. He was of noble and majestic appearance, and, notwithstanding his disputes with the popes, a friend to religion. After his death his son Frederick, duke of Suabia, took the chief command, but died of a pestilential disorder at the siege of Acre in 1191; and of the mighty army that Frederick led from Germany only a small remnant returned.

FREDERICK II., Emperor of Germany. On the death of Frederick I. he was succeeded by his son Henry, who reigned only eight years, leaving his son Frederick, a child of four years of age, who had been created king of the Romans when in his cradle. He was very carefully educated by his mother, Constance of Sicily, and acquired a degree of learning very extraordinary at that age. His hereditary dominions consisted of the kingdoms of Naples and Sicily, the duchy of Suabia, and other territories in Germany. In 1210, the emperor Otho being excommunicated by the pope, Frederick, then fourteen years of age, was declared emperor by a considerable number of the German princes, but it was not till some years afterwards, on the retreat and death of Otho, that he became peaceable possessor of the imperial throne, and was crowned at Aix-la-Chapelle in 1215. Scarcely another prince in the middle ages, Charlemagne excepted, has made so distinguished a figure; the most remarkable period of those ages is connected with his name and his long reign. It was the time in which Innocent III., Gregory IX., and Innocent IV. carried Gregory's VII.'s policy to an extent that had been considered as impossible; when, by the origin of the orders of knighthood, the foundation of the Mendicant orders, and the Inquisition, were formed powerful supporters of the spiritual edifice; when the nations of Europe were for the first time impressed by the Crusades with one general idea, represented by the symbol of the Cross, and drawn closer together; when, after many single voices had died away unheeded or forgotten, a Protestantism of the middle ages was proclaimed by the Waldenses and a kind of Manichæism by the Albigenses; when chivalry attained a more elevated position, ennobled by religion and a regular organisation; when the class of free citizens gradually rose in estimation and importance, and favoured in Germany by Frederick against the aristocracy, and opposed by him in Upper Italy as instruments of the popes, acquired, by means of great confederations of many cities, and, by the institution of corporate bodies, respect abroad and internal strength; when, in opposition to the club-law, a law for ensuring public peace and security was first proclaimed in the German language; when the Secret Tribunal began to act in its first, scarcely perceptible commencement; when the first universities excited a spirit of inquiry and research; and when the poetry of the Troubadours found a home in Germany and Italy, and was honoured and cultivated by emperors and kings.

Frederick, though not tall, was well made; he had a fine open forehead, and a mild and pleasing expression of the eye and mouth. The heir of all the best qualities of all the members of his distinguished race, enterprising, brave, liberal, with excellent natural talents, full of knowledge; he understood all the languages of his subjects, Greek, Latin, Italian, German, French, and Arabic; he was austere, passionate, mild, and generous, as the occasion prompted, cheerful, magnificent, and fond of pleasure. And as his body had gained strength and elasticity by skill in all chivalrous exercises, so his mind and character, early formed in the school of adversity and trial, had acquired a degree of flexibility which those who are born to power but seldom know, and an energy which strengthened and raised him in times of difficulty. But such a body and such a mind were necessary for a man who was to combat in Germany, already divided into parties, a preponderating aristocracy; in Upper Italy a powerful democracy; in Central Italy an arrogant hierarchy; and in his own southern hereditary dominions, to reconcile, and unite by internal ties, the hostile elements of six nations; who, opposed by temporal and spiritual arms, by rival kings, by excommunication and interdict, persevered, conquering and conquered, for forty years, survived the rebellion of a son, the treachery and poison of his most valued friend, the loss of his favourite child, and did not resign the sceptre, which he had held so firmly, till the last moment of his life.

Till the year 1209, when Frederick took upon himself the government of Lower Italy and Sicily, he was under the guardianship of Innocent III.; but the empress Constance, his mother, was obliged to purchase the investiture of Naples and Sicily, and the coronation

of her son, by sacrificing to the pope the most important ecclesiastical rights. The royal crown of Germany, which was adjudged by the German princes to the child when only three years of age, was taken, after the death of his father, by the Duke of Suabia, his uncle, who however wore it without advantage in opposition to Otho IV. till he was murdered in 1208 by Otho von Wittelsbach; but Otho IV. displeasing the pope, Innocent himself called Frederick to the throne of Germany. In spite of all the efforts of the party of the Guelphs, Frederick arrived in Germany in 1212, and was received with open arms by the party of the House of Hohenstaufen. The possession of the crowns of Germany and Sicily inspired Frederick with hopes of making himself master of all Italy, subduing Lombardy, and reducing the power of the spiritual monarch to the dignity of the first bishop of Christendom. But he misunderstood the spirit of his age, which was far less enlightened than himself, and still cherished prejudices which he had overcome. If the conception of the plan was great, it was equalled by his prudence in gradually preparing to carry it into effect. In 1220 he caused his eldest son Henry to be chosen king of the Romans, and appeased the anger of the new pope Honorius III. by alleging that this measure was absolutely necessary before he could proceed to the crusade which he had undertaken, and by promising that he never would unite Sicily with the empire. Disregarding the refusal of the Milanese to place the iron crown on his head, he proceeded to Rome, was crowned emperor in 1220, and as such hastened to his hereditary dominions which he had left almost as a fugitive. It was there that preparations were to be made for the crusade, but first of all it was necessary to put an end to the internal troubles of the country. By the advice of Hermann von Salza, grand master of the Teutonic order, Frederick married Yolande, daughter of John of Brienne, titular king of Jerusalem, and assumed his father-in-law's title. Meantime the pope granted him a delay for undertaking the crusade; his chancellor, Peter de Vinci, compiled a new code of laws, the object of which was to settle the authority of church and state, to reconcile the nobility, clergy, citizens, and peasants, and to be adapted to many different nations, Romans, Greeks, Germans, Arabs, Normans, Jews, and French, respecting as much as possible all existing institutions. For the education of his subjects, he founded a university at Naples in 1224; and the medical school at Salerno was very flourishing. The belles-lettres were cultivated at his court, and Frederick himself, some of whose juvenile poems in the Sicilian dialect, at that time the most cultivated, have been preserved to our times, may be considered as one of the first authors of the refined Tuscan poetry. Many eminent artists, Nicola, Masaccio, and Tomasi da Steffani, were patronised by Frederick; and the collections of works of art at Capua and Naples were founded.

The year 1227 being fixed for the crusade, Frederick proposed before he set out to call a general diet of the empire at Cremona, to satisfy himself of the sentiments of the Lombards and be crowned as their king. But the Milanese refused, renewed their ancient league with fifteen cities, and intercepted the communication with Germany by occupying the passes of the Alps. For this they were put under the ban of the empire; but Frederick hastening to the crusade, left the management of the affair to the pope, who only proposed a general amnesty, and enjoined the Lombards to furnish 400 horsemen at their expense, for two years, to join the crusade. At this juncture Honorius died, and Cardinal Hugolinus, nephew of Innocent III., was chosen pope by the name of Gregory IX. Resembling, in the energy of his will, Gregory VII., the new pope urged the emperor, who received the cross for the second time from his hands, to fulfil his promise, and did not hesitate to censure the luxurious way of life of the emperor and his court. A great number of pilgrims had assembled in Italy, but pestilential diseases raged among them, and the emperor himself was ill when he embarked with Louis, landgrave of Thuringia. In three days Frederick grew worse, and was obliged to land at Otranto, where Louis Landgrave died. The fleet proceeded only to the coast of the Morea, and the crusade failed. Upon this Gregory excommunicated the emperor, and laid his dominions under an interdict. Frederick however, notwithstanding the death of his wife Yolande in child-bed, set out on a new crusade in 1228; but Gregory, who had not expected this, and thought it improper for a prince under excommunication to go to the Holy War, commanded the patriarch of Jerusalem and the three orders of knights to oppose the emperor in everything, and caused Frederick's hereditary estates to be occupied and laid waste by his soldiers and John of Brienne. Frederick, notwithstanding all this, by an agreement with Kamel, sultan of Egypt, succeeded in making a ten years' truce, and acquired for himself Jerusalem, the holy places, all the country between Joppa, Bethlehem, Nazareth, and Acre, and the important seaports of Tyre and Sidon.

The city of Jerusalem, where Frederick, on the 18th of May, put the crown upon his own head because no priest would even read mass, was laid under an interdict, and Frederick was even betrayed to the sultan, who gave him the first information of it. Frederick hastened back to Lower Italy, and after fruitless negotiations with Gregory reconquered his hereditary estates and defeated all the intrigues of the pope, who was at length obliged (1230) to free him from the excommunication. The Lombards alone would not hear of any terms, prevented his son Henry from going to the diet at Ravenna, and were not deceived by Gregory's exhortation to peace. While Frederick at last

blamed for his excessive love of external pomp, and for the lavish manner in which he rewarded his favourites. It should be added in his praise, that he gave great encouragement to arts and sciences. He founded the University of Halle, and the Academy of Sculpture and Painting at Berlin. He enlarged his capital by adding to it the suburb called Friederichstadt, built the palace of Charlottenburg, in honour of his second wife, and founded in 1705 the Supreme Court of Appeal.

FREDERICK II., King of Prussia, distinguished by his contemporaries and posterity by the surname of the Great, was the son of Frederick William I. and of Sophia Dorothea, princess of Hanover, and was born on the 24th January, 1712. He passed the first years of his youth under the restraints of a rigid education, the sole object of which was military exercises; but as he had received the rudiments of his education from a French lady, under whose care he acquired considerable knowledge of the language, and as she and his first tutor, M. Duhan, had great influence over him, he imbibed a taste for polite literature. These two persons, together with the queen, formed in secret a kind of opposition to his father's system of education. The prince was entirely attached to his mother, and there arose an estrangement between the father and the son, which suggested to the king the idea of leaving the throne to his younger son Augustus William. Impatient of the tyrannical conduct of his father, Frederick resolved to seek refuge in England with his maternal uncle George II. Only his sister Frederica, and his friends lieutenants Katt and Keith, were acquainted with the secret of his intended flight, which was to take place from Wesel, whither he had accompanied his father. But some indiscreet expressions which fell from Katt betrayed the prince's intention. The prince was overtaken, and sent to Custrin, where he was kept in close confinement. Keith escaped, and lived in Holland, England, and Portugal, till after Frederick's accession, when he returned to Berlin. Katt was taken and beheaded. It appears certain that the king had resolved to take away his son's life, and that he was only saved by the intercession of the emperor of Austria, Charles VI., through his ambassador, Count Seckendorf. (Voltaire, *Mémoires*, &c.) The prince, after he had been released from his strict confinement in the castle of Custrin, was employed by his father as youngest member of the Chamber of Domains, and not permitted to return to court till the marriage of the princess Frederica to the hereditary prince Frederick of Baireuth. In 1733 his father obliged him to marry the princess Elizabeth Christina, daughter of Ferdinand Albrecht, duke of Brunswick-Bevern. Frederick William gave her the palace of Schönhausen, and to the prince the county of Ruppin, and in 1734 the town of Rheinsberg, where he appears to have lived happily, chiefly devoting himself to literary pursuits and to music till his accession. Among the persons about him were Bielefeld, Chuzot, Suhm, Fouquet, Knobelsdorf, Keiserling, Jordan, and other learned men; likewise the composers Graun and Benda, and the painter Pesna. He had an uninterrupted correspondence with foreign literati, especially with Voltaire, whom he admired above all others. During his retirement at Rheinsberg, he composed several works, one of which was the *'Anti-Machiavel,'* published at the Hague in 1740. The death of his father in 1740 placed him on the throne. Finding a full treasury and a powerful army, his thirst for military glory tempted him to embrace any opportunity that might offer; but there did not appear to be any occasion for great enterprise till the death of the emperor Charles VI., on the 20th October 1740, led the way to his extraordinary and brilliant career which changed the face of Europe. Frederick took this opportunity of asserting the claims of the House of Brandenburg to four principalities in Silesia, the investiture of which his predecessors had not been able to obtain; but he only required from queen Maria Theresa, the daughter and heiress of Charles VI., the duchies of Glogau and Sagan, promising on his side to support her against all her enemies, to vote for her husband's elevation to the imperial dignity, and to pay her 2,000,000 dollars. His proposals being rejected, he took possession of Lower Silesia in December 1740, and defeated the Austrian army at Mollwitz, on the 27th April 1741.

This victory, which nearly decided the fate of Silesia, raised up more enemies to Austria. France and Bavaria united with Prussia, and the war of the Austrian succession began. George II., king of England, the only ally of Maria Theresa, advised her to make peace with Prussia, because Frederick was her most active and formidable enemy. Frederick having obtained a victory at Ocaslau on the 17th of May 1742 over Prince Charles of Lorraine, peace was concluded at Berlin on the 28th of July, and the first Silesian war was ended. Frederick obtained the full sovereignty of Upper and Lower Silesia, and the county of Glatz, with the exception of Tropaup, Jägerndorf, and Teschen. On his side, he renounced all claims to the other Austrian dominions, took upon himself a debt of 1,700,000 dollars, with which Silesia was charged, and promised to respect the rights of the Roman Catholics in Silesia. Saxony acceded to this peace, and it was guaranteed by France and England. Frederick immediately profited by it to organise his new conquests, and to render his army more formidable. On the death of the last count of East Friesland in 1743 he took possession of that country, to which his house had asserted a claim ever since the year 1644. When in the prosecution of the Austrian war the emperor Charles VII. had been obliged to fly from his hereditary dominions, and the Austrian arms were everywhere

victorious, Frederick feared that Silesia might be taken from him. He therefore secretly entered into an alliance with France in April 1744, and with the emperor, the Palatinate, and Hesse Cassel, on the 22nd of May 1744, promising to support the cause of the emperor by invading Bohemia, but requiring for himself the circle of Königgrätz in Bohemia. On the 10th of August 1744 he unexpectedly entered Bohemia, and took Prague; but being pressed by the Austrians under Prince Charles of Lorraine, and the Saxons their allies, he was obliged to leave Bohemia before the end of the year. The death of the emperor Charles VII. on the 18th of January 1745, and the defeat of the Bavarians at Pfaffenhofen, induced his son the young elector, Maximilian-Joseph of Bavaria, to make peace at Füssen with Maria Theresa, and the Frankfurt union was dissolved; Hesse Cassel declaring itself neutral. On the other hand, England, Austria, the Netherlands, and Saxony, had concluded a strict alliance at Warsaw on the 8th of January 1745, and Saxony had besides entered into a special convention with Austria against Prussia on the 18th of May 1745. But Frederick defeated the Austrians and Saxons on the 4th of June at Hohenfriedburg in Silesia, then entered Bohemia, and gained another victory after a very obstinate combat at Sorr, on the 30th of September 1745. The victory of the Prussians, under Prince Leopold of Dessau, over the Saxons at Kesselsdorf, on the 15th of December, led to the treaty of Dresden, December 25, 1745, which was concluded on the basis of the treaty of Berlin; so that Frederick retained Silesia, acknowledged the husband of Maria Theresa, Francis I., as emperor, and Saxony engaged to pay to Prussia one million of dollars. Thus ended the second Silesian war.

During the eleven years' peace that followed, Frederick devoted himself with unremitting activity to the internal administration of his dominions, the organisation of the army, and to literary pursuits. Among the grand improvements which he contemplated was a reform in the judicial proceedings, with a view to render them more simple and uniform, in all the different provinces of his dominions. Together with his chancellor Cocceii, he compiled the *'Frederician Code,'* a body of laws for the dominions of the King of Prussia, founded on reason and the constitution of the country. It is not easy to understand what is here meant by the word *'constitution.'* His father, it is true, drew up with great care what he called a constitution (*Verfassung-Urkunde*), or instructions for the supreme general board of finance, war, and domains, which he issued in 1722, and which is printed by Dr. Förster in his *'Life of Frederick William I.,'* but it is not likely that this is here alluded to. Frederick also wrote *'Memoirs of the House of Brandenburg,'* a concise account of his house, written in a good style, with a positive declaration of impartiality, which of course is to be taken with some allowance. Another work, a didactic poem in six books, on the *'Art of War,'* is his most considerable poetical production, and is greatly esteemed. These, and all his other works, are in French. These recreations did not divert his attention from the paramount duties of his position, which he always performed with the most persevering care. Instead of indulging in the pleasures of the chase, he made journeys to different parts of his dominions. He endeavoured to make agriculture, manufactures, and the arts flourish; and encouraged commerce, the true principles of which however he appears not to have understood. Though possessing no naval force, he insisted on the right of free navigation for his subjects, without molestation from the fleets of contending parties. One grand object was to improve his revenues, a measure necessary for the maintenance of his army, which he had increased to 160,000. He expended large sums in gratifying his taste for the arts, by decorating the palaces of Berlin and Potsdam, and in erecting many splendid edifices in those two places, in which however there was this incongruity, that the richest architectural decorations were often lavished on the exterior of buildings which were only barracks for the troops.

When the war broke out between England and France in 1755, the English government concluded a treaty with Frederick, the chief object of which was to secure Hanover from invasion. This led to a secret alliance between France, Austria, Saxony, and Russia, of which Frederick, having been privately informed, chiefly through the treachery of a clerk in the Saxon chancery, became apprehensive of an attack, and of the loss of Silesia. He accordingly resolved to anticipate his enemies, and commenced operations by invading Saxony on the 24th of August 1756; which was the beginning of the third Silesian, or, as it is generally called, *"The Seven Years' War."* This contest was the most extraordinary and important in modern times, previous to those of the French revolution. Though Frederick is the hero, the history of the war is, in fact, the history of continental Europe. Frederick, intending to invade Bohemia, required a passage through Saxony, which the elector king of Poland anticipating, assembled his troops in an entrenched camp at Pirna. Frederick invested it, and having defeated, at Lowositz, the Austrians who came to its relief, it surrendered; and he compelled all the privates to enlist in his own army. In 1757, he advanced into Bohemia, and gained, on the 5th of May, a great victory at Prague, over the Austrians, under Prince Charles of Lorraine and Marshal Brown. The Austrians took shelter in Prague, which Frederick immediately invested; but the approach of the Austrians under Marshal Daun, changed the face of the campaign. Daun formed an entrenched camp at Kolin, which Frederick attacked, but was defeated with great loss

on which he raised the siege of Prague, and retreated into Saxony. Meanwhile the French compelled the Duke of Cumberland to abandon Hanover, of which they took possession; and about the same time the Russians and Swedes invaded Prussia from the north: but though Frederick's affairs were supposed by his enemies to be desperate, he was not dismayed. He first attacked the united French and Austrian army, twice as numerous as his own, at Rosbach, and gave them a total and most disgraceful defeat. He then marched into Silesia, where the Austrians had taken Breslau, gained a great victory over them at Lissa, and recovered Breslau. The Russians and Swedes had retreated from the Prussian territories, and the Hanoverians had assembled a large force under Prince Ferdinand of Brunswick, to co-operate with the Prussians. Thus at the close of 1757 the king's affairs were so far restored, that he might have hoped for success in the next campaign, if he could have kept back the Russians; but the enmity of the Empress Elizabeth was inveterate. However the admiration which Frederick's conduct had excited in England, and confidence in his ability, induced the English government to grant him a subsidy of 670,000*l.*, which became an annual grant. In the campaign of 1758 the principal event was the sanguinary battle at Zorndorf, between the Prussians and the Russians, in which the latter were defeated, but the loss on both sides was immense. In 1759 the king's first object was to stop the progress of the Russians, who advanced to Frankfurt-on-the-Oder. On the 12th of August was fought the battle of Kunnersdorf. At the beginning of the day, the King of Prussia thought himself so sure of the victory, that he despatched a letter to that effect to the queen at Berlin; but in the end, he was obliged to quit the field, and wrote a second letter to the queen, desiring her to send away the royal family, and to have the archives removed, adding, that the city might make terms with the enemy. But Berlin was saved. Frederick's skilful conduct after his defeat induced the Russian general, instead of entering Brandenburg, to join the Austrians in Lusatia; but soon afterwards, General Finck, with 15,000 men, was taken prisoner by the Austrians, and a smaller corps shared the same fate. Frederick however received reinforcements, and Marshal Daun was contented to occupy the camp at Pirna and cover Dresden. In the following spring some fruitless negotiations for peace took place. In this campaign the city of Dresden suffered very severely from a bombardment, by which Frederick destroyed the finest part of the city. On the other hand, the Russians and Austrians entered Berlin, which was saved from plunder by a composition, but had to pay heavy contributions. Berlin was soon evacuated, and Frederick, who was hastening to its relief, turned into Saxony, where he was induced, by the desperate condition of his affairs, to venture to attack the Austrians, who were strongly posted at Torgau. He defeated them, after an obstinate battle, which compelled them to retreat. The Russians and Swedes also quitted his dominions, and he was able to recover strength in winter quarters in Saxony.

At the commencement of 1761 it was evident that the king of Prussia's situation was most critical. He confessed himself that, after the great losses he had sustained, his army was not equal to what it had formerly been. He accordingly occupied a strong camp in Silesia, where he remained immovable, watching his enemies, but was unable to prevent Marshal Laudohn from taking Schweidnitz, and the Russians, Colberg. Frederick's situation was now so desperate, that he appears to have seriously contemplated suicide: in this critical state, the only event perhaps which could have saved him occurred. This was the death of the empress Elizabeth on the 5th of January 1762, and the accession of Peter III., who was an enthusiastic admirer of Frederick, with whom he immediately concluded a treaty of alliance. Peace was also made with the Swedes, and though Peter was soon deposed, yet Catharine, who succeeded him, observed a strict neutrality during the remainder of the war. The king and his brother, prince Henry, gained several advantages in 1762 and 1763, and peace having been concluded between Great Britain and France, Austria was left alone, and the empress queen obliged to conclude peace with Prussia. The two powers mutually guaranteed the whole of each other's German dominions, Frederick only promising to give his vote to Joseph as king of the Romans. The king of Poland was restored to his dominions without compensation. Thus ended the Seven Years' War, which, after immense sacrifices of human life and treasure, left the political balance of Europe unchanged.

The issue of this great contest, in which the genius of Frederick had been so eminently distinguished, secured to him a decisive influence in the affairs, not only of Germany, but of all Europe. Returning to his capital after an absence of more than six years, he seriously directed his attention to repair the evils inflicted on his dominions by the war. He opened his magazines to give his subjects corn, both for food and for seed. He distributed horses among the farmers, rebuilt at his own expense the houses which had been burnt, founded colonies, erected manufactories, and made canals for the convenience of inland trade. Silesia was exempted from the payment of all taxes for six years, and the New Mark and Pomerania for two years. To relieve the nobility in those three provinces, a system of credit was introduced, by which the value of estates was raised, and the rate of interest reduced. In 1764 he founded the bank of Berlin, to which he gave eight millions of dollars as its first fund. Though he really desired to promote trade, from his ignorance of true commercial principles, and his desire to

increase the revenue, he was induced to take measures, some of which were injudicious, and others decidedly unjust: for instance, the debasement of the current coin. Meantime he continued to maintain a very large army. In March 1764 he concluded an alliance with Russia, by which he supported the election of the new king of Poland, Stanislaus Poniatowski, and the cause of the oppressed dissidents in Poland. In 1772 he agreed to the first partition of Poland, by which he obtained all Polish Prussia (which was ceded in 1466 by the Teutonic Order to Poland) and a part of Great Poland, as far as to the river Netz, but with the exception of Danzig and Thorn. Frederick has been accused of having first suggested the partition of Poland; but the fact is, that Frederick I. had formed a plan for the partition of Poland, drawn up in the year 1710. From that time the kingdom of Prussia was divided into East and West Prussia. In 1778, on the death of the elector of Bavaria, without children, Frederick interfered to prevent Austria from partitioning that country. The war was however terminated without a battle, by the treaty of Teschen, in May 1779, by which Austria renounced its intentions, and consented to the union of the Franconian principalities with Prussia. In 1785, the emperor having formed a plan to obtain Bavaria in exchange for the Low Countries, Frederick defeated it in conjunction with Saxony and Hanover, by concluding the alliance between the German princes, called the 'Fürstenbund,' which has been considered as the masterpiece of his policy. In 1786 he concluded a treaty of amity and commerce with the United States of America. Though he had long suffered from gout and asthma, which terminated in confirmed dropsy, not a little aggravated by his indulgence in the pleasures of the table, he continued his unremitting attention to public affairs till within two days of his death, the approach of which he contemplated with composure: he died on the 17th of August 1786, at his favourite palace of Sans Souci, in the seventy-fifth year of his age, and the forty-seventh of his reign, leaving to his nephew, Frederick William II., a kingdom enlarged, from 2190 to 3515 German square miles; about 70,000,000 of dollars (10,000,000*l.* sterling) in the treasury, and an army of 200,000 men.

The character of Frederick II., and his public and private life, have furnished the subject for numerous publications in all the European languages, which are perfectly familiar to most classes of readers. One of his great merits was, that he did not contract any public debt, and though he raised a very large revenue, yet a considerable part returned into the pockets of his subjects through various channels. Among his defects may be reckoned his contempt for religious institutions. He was avowedly an unbeliever in revealed religion, and his notions respecting natural religion appear to have been vague and fluctuating. With respect to his temper, he seems to have been deficient in real sensibility; and though many examples of his clemency and placability are recorded, he was at times harsh and even cruel. His moral conduct was guided generally by his pleasure and his interest, and in that respect, as well as his religion, he was greatly influenced by his predilection for French literature, and especially his intimacy with and admiration of Voltaire. Proud as the Germans in general are of Frederick, they cannot help regretting his contempt of German literature. It must however be owned that German literature, at the commencement of Frederick's life, was in a very low state, and it may be doubted whether the literature and language of Germany did not gain rather than lose by his neglect of them. Frederick was essentially a despot, and his interference with what he confessedly did not understand, would probably have done more harm than good. His voluminous works, all in French, would have entitled him to a certain amount of distinction in the literary world, even if he had not been a king. Besides the works already mentioned, he published military instructions, and some miscellaneous pieces in 4 vols. 8vo. His posthumous works, in 15 vols., contain the history of his own times, the history of the Seven Years' War, and memoirs, from the treaty of Hubertsburg, 1763, to the end of the partition of Poland.

FREDERICK WILLIAM, Elector of Brandenburg, surnamed the Great Elector, was the son of the Elector George William. In the distracted state of Germany during the Thirty Years' War, and the necessary absence of his father with the army, the young prince saw but little of the splendour and indulgences of a court, and passed the first years of his life in retirement with his tutors, who were men of learning and experience, and with his mother, first at the castle of Litzingen, in the forests of the Altmark, and afterwards at Custrin. The adventures and the singular fortunes of the family of his mother (who was sister of Frederick, King of Bohemia, husband of the Princess Elizabeth, daughter of James I. of England), the cruel and barbarous manner in which the war was carried on, and the dangers to which he and his family were exposed, necessarily made a deep impression on his mind. At the age of fifteen he was sent to the University of Leyden, where he especially devoted himself to the classics and to history. Of modern languages he was a proficient in the French, Dutch, and Polish. He was afterwards in the camp of Frederick Henry, prince of Orange, during the siege of Breda, and was much noticed by the prince for his amiable manners and exemplary conduct, as well as for his sound understanding. About this time a society of young persons of both sexes (called *Media Noctæ*) endeavoured to draw the prince into its circle; but his friend and tutor, the Baron Schulenberg, making him aware of the immoral nature of the society, the prince resolved immediately to quit the Hague. The Prince of

Orange was much surprised at this self-command, and when the prince arrived in the camp before Breda, said to him, "Cousin, your flight is a greater proof of heroism than if I took Breda; he who so early knows how to command himself will always succeed in great deeds." These words, as he himself owned, made a deep impression on him.

His father dying in 1640, the young prince found his dominions reduced to a most deplorable condition by war and bad government. The exactions of Wallenstein in the Mark alone were estimated at twenty millions of gold florins: and in a memorial of the magistrate of Prenzlau, it is stated that the inhabitants are reduced to such dreadful extremities that they not only eat dogs, cats, and even carrion, but that both in the town and country they attack and kill each other for food. He commenced his government with a degree of prudence and wisdom rarely found in so young a sovereign. His first care was to correct many crying abuses, and to restore order in the finances. His attention was then directed to foreign affairs. In 1642 he received the investiture of Prussia from the King of Poland; in 1643 he concluded a peace with the Swedes on condition of their evacuating the greater part of his dominions. At the peace of Münster he was not able to enforce his claims to Pomerania and Silesia, but obtained Magdeburg, Wallenstadt, Minden, and part of Pomerania. It is highly to his credit that it was chiefly owing to him that the principle of equal rights and privileges for the two great divisions of the Protestant church was admitted in that famous treaty. Charles Gustavus, king of Sweden, appearing emulous of rivalling Gustavus Adolphus, the elector concluded an alliance with Holland, and sought the friendship of Cromwell and Louis XIV. He was however obliged to make in 1655 a treaty with the Swedes, in consequence of which he joined in the invasion of Poland, and greatly contributed to the victory at Warsaw. Austria, Holland, and Poland vehemently protested against this alliance with Sweden. Cromwell however, who believed the Protestant cause to be in danger from the King of Poland, sent William Jenson as his ambassador to the elector, whom in letters he compliments in the highest terms for his service to the Protestant religion. But Russia and Austria declaring in favour of Poland, he, by the mediation of Austria, concluded a convention with Poland at Wehlau, by one of the stipulations of which he obtained the entire sovereignty of Prussia; and in 1678 completed the conquest of all Pomerania by the taking of Greifswald and Stralsund. The death of Charles Gustavus freed him from an adversary who would probably have endeavoured to prevent the execution of this treaty, which was confirmed by the treaty of Oliva. Frederick, now at peace with his neighbours, directed all his attention to promote the welfare of his subjects by favouring all internal improvements; the ruined towns and villages were rebuilt, new roads made, waste lands cultivated, commerce encouraged, and many useful establishments founded.

In 1672 however, Holland being threatened by Louis XIV., he concluded a treaty with the republic, engaging to furnish 20,000 men for its defence. He also contributed to induce the Emperor, Denmark, Hesse Cassel, and several German princes to join him against France. But though his advance into Westphalia induced the French to quit Holland, the campaign was rendered unsuccessful by the slowness of the Austrian general, and he was forced to abandon Westphalia to the enemy. The Austrians leaving him, and the Dutch neglecting to send him subsidies, he was obliged to make a convention with France in 1673. The French were to evacuate Westphalia and pay him 800,000 livres, he promising to withdraw from his alliance with Holland, and not to support the enemies of France; yet he reserved to himself the right of assisting the German emperor in case of attack. This happened in 1674, when he invaded Alsace with 16,000 men, and joined the Imperial army; but the Austrian general, Bournonville, avoided a battle, contrary to the advice of Frederick, and Turenne receiving reinforcements, obliged the Germans to quit Alsace. In order to free themselves from Frederick, the French instigated the Swedes to invade Pomerania and the March, which they attacked in December 1674 with 16,000 men. Frederick hastened to his dominions, and proceeding with great rapidity and secrecy at the head of only 5000 men, he totally defeated 11,000 Swedes at Fehrbellin in 1675, and freed his dominions from the enemy. Following up his successes, he took Stettin. In January 1679 he crossed the Frische Haff and the Gulf of Courland with his army on sledges over the ice, and surprising the Swedes in their winter quarters, compelled them to quit Prussia. He did not reap any real advantage from his success, for Louis XIV. insisted that he should make peace with Sweden and give up all his conquests; and on his refusal sent an army of 30,000 men to lay waste the duchy of Cleves and city of Minden, so that he was forced to conclude the treaty of St. Germain, by which he restored all his conquests to Sweden; the French withdrew from his Westphalian dominions, and paid him 300,000 crowns. After this we do not find Frederick again in the field. He was indeed engaged in various negotiations; was involved in disputes with France on account of its seizure of Strasbourg and Luxembourg; and in consequence of his reception of 20,000 French Protestants who left their country on the repeal of the edict of Nantes. Frederick, who had previously obtained from his ambassador, Von Spanheim, notice of the intended measure, had made preparations to receive the fugitives, and sent funds to his agents at Frankfurt, Amsterdam, and Hamburg, for their assistance. In like

manner he protected the proscribed Waldenses. Having in vain interceded for them in a very affecting letter to the Duke of Savoy, he offered to receive 2000 of them into his dominions. He sent 8000 men in 1686 to assist the emperor against the Turks; having in the year preceding renewed his alliance with Holland; and when Prince William of Orange was preparing for his expedition to England, Frederick assisted him with several regiments, and Marshal Von Schomberg, who became so great a favourite of William, and was eventually killed at the battle of the Boyne. As another proof of Frederick's enterprising spirit, it deserves to be noticed that Spain neglecting to pay him the arrears of a subsidy promised him for his co-operation against France, he resolved to commence a war by sea against that power: he fitted out eight frigates which had been employed against Sweden, and sent them in 1680 to capture Spanish ships, and they actually took some rich merchantmen.

We have not space, nor is it necessary to detail the proceedings of this great prince in consolidating the prosperity of his dominions and the welfare of his subjects. He died in April 1688, leaving to his son a much enlarged and highly cultivated territory, a well-filled treasury, and an army of 30,000 excellent troops. He was twice married; first in 1647 to Louisa Henrietta, princess of Orange, an amiable and accomplished person, author of the celebrated German Hymn 'Jesus mien Zuversicht.' She died in 1667. In the following year Frederick married Dorothea, duchess dowager of Brunswick Lüneburg; but though an excellent and virtuous princess, she was not liked by the people, chiefly because she was on ill terms with her step-children, especially the crown-prince. The character of Frederick, both in public and private life, has always been highly esteemed. He was kind, generous, fond of society, and though rather quick in his temper, extremely placable. As a sovereign he appears to have justly merited the surname of the Great Elector.

FREDERICK WILLIAM I., King of Prussia, son of Frederick I., was born in 1688. At a very early age he manifested a predilection for military exercises: at the age of five years he was sent to Hanover to be brought up with the electoral prince, afterwards George II. of England. The court of his grandfather, where the mode of living was strictly economical, simple, and without the restraints of rigid etiquette, pleased the young prince much more than the formal magnificence of his father's court. He served in the allied army against the French, and distinguished himself at the siege of Menin and the battle of Malplaquet. In 1706 he married the princess Sophia Dorothea of Hanover.

His character being in many respects directly the reverse of that of his father, he commenced, immediately on his accession on the 25th of February 1713, to retrench the luxury that had prevailed in the preceding reign; he reduced the salaries of persons in office, limited their number, and endeavoured to introduce order into the finances. In his own person he set an example of the utmost plainness of apparel, and laid aside all the formalities of his station; while the queen and princesses were allowed to wear only dresses of the simplest kind. He devoted himself to public business, examined everything, was easy of access, and received and answered letters from the meanest of his subjects; but he was austere and arbitrary, and carried to the utmost extent his ideas of the divine right of kings. Though he repeatedly declared the republican constitution of Holland to be a model for all states, and boasted that he was himself a true republican, he was very far from allowing any check on his own power. His reforms in the finances and expenditure enabled him to gratify his most ardent wish, of keeping a great military establishment, and he laid the foundation of that strict discipline and regularity by which the Prussian troops have been since so greatly distinguished. His childish passion for tall soldiers is well known. No expense was spared in order to gratify it, men of gigantic stature were picked up in all the neighbouring states, and many were even kidnapped or forced into his service, by which he involved himself in many serious quarrels. The economy of his internal administration enabled him to repopulate those provinces which were desolated by the plague, by means of colonies from other states, which he settled on very advantageous terms. He was liberal in rewarding the industry and ability of those who introduced any new art, and many of the richest manufactures in the Prussian dominions owe their foundation to him. But he had a mortal aversion to all abstract sciences, and even to poetry and literature; and he expelled the celebrated philosopher Wolf for his metaphysical opinions. He erected many public buildings at a considerable expense, but built little, and with great economy, for himself and his court. He founded the Medico-Chirurgical College, the Charité, and the Foundling Hospital at Berlin, the Berlin Cadet Establishment, and the Orphan House at Potsdam; the emigrants from Salzburg and the Polish dissidents met with a favourable reception in his dominions. On the other hand the Berlin academy and the universities narrowly escaped dissolution. The details of his private life have been given at great length by his daughter, the Margravine of Bareith, and his character is portrayed in a few happy touches by Voltaire ('Mémoires, &c. écrits par lui-même').

The public events of the reign of Frederick William were of no great importance. In the treaty of Utrecht, France and Spain recognised his royal title, and the sovereignty of Neuchâtel and Valengin was given him. In the course of the war in the north, in which his

father had taken no part, the Russians and Saxons, after the capitulation of the Swedish general, Steenbock, in Tönningen, resolved to occupy Swedish Pomerania. The king wished to restore tranquillity in the north by his mediation; but Charles XII., who had returned from Turkey to Stralsund, rejected his proposals, and required Prussia to give back Stettin, but refused to repay the 400,000 dollars which Frederick had advanced to indemnify the Russians and Saxons for the expenses of the war. This induced Frederick William in 1715 to declare war against Sweden, and to make an alliance with Russia, Saxony, and Denmark. In this war the island of Rügen and Stralsund were taken, but no other event of importance occurred, and after the death of Charles XII. peace was restored; Prussia retaining Hither Pomerania, Stettin, and the islands of Usedom and Wollin, and paying to Sweden 2,000,000 of dollars. Count Seckendorf, the Austrian ambassador, induced the king to withdraw from the alliance which had been concluded at Hanover, between England, Holland, and Prussia, after George II. had ascended the throne of England, and to agree in the treaty of Wusterhausen, in October 1726, to recognise the Pragmatic Sanction, and, if necessary, to support it with 19,000 men. On the breaking out of the war in Poland in 1733, he caused King Stanislaus, the opponent of Augustus II., to be honourably received at Königsberg, when he fled from Poland, by which conduct he displeased the courts of Vienna and St. Petersburg, the allies of Saxony. However, when France declared war against Austria, he assisted Austria with a corps of 10,000 men upon the Rhine. The king and the crown-prince were for some time with this corps; but nothing of importance was effected, and peace was concluded at Vienna in 1735. About this time Frederick William fell into a weak state of health, which increased the natural violence of his disposition. He was for a time supposed to be in great danger, but recovered and lived for some years, on the whole upon pretty good terms with his son, in whose arms he expired on the 31st of May 1740. He left to his successor 9,000,000 of dollars in his treasury, a disciplined army of 70,000 men, and a kingdom of the extent of 2190 German square miles, with a population of 2,240,000 inhabitants.

FREDERICK WILLIAM II., King of Prussia, was born in 1744. His father was Augustus William, second son of Frederick William I., upon whose death in 1758, his uncle, Frederick the Great, declared him Crown Prince of Prussia. The young prince soon indulged in a mode of life which was highly displeasing to his uncle, and alienated them from each other for many years. Frederick II. however expressed his satisfaction to the crown-prince, on his giving proofs of personal bravery in the war of the Bavarian succession, 1778. Frederick William's first wife was Elizabeth Christina Ulrica, princess of Brunswick, from whom he was separated in 1769. He afterwards married the Princess Louisa of Hesse Darmstadt. His accession in 1786 was under favourable circumstances. Prussia was engaged in no contest with foreign enemies, and the policy of Frederick II. had made him, in the latter part of his life, in some measure an arbitrator in the affairs of Europe. Political errors soon lessened Frederick William's credit with foreign cabinets, and the treasure left by his uncle was wasted in useless wars, and by the extravagance of his favourites. His first interference in foreign affairs was in 1787, when he sent an army, under Duke Charles William Ferdinand of Brunswick, to Holland, where the patriots refused to recognise the right of the stadtholder, and insulted his wife, Frederick William's sister, on her way to the Hague, for which however satisfaction had been given. The Prussians advanced without opposition to Amsterdam, and the old order of things was soon restored, upon which a defensive alliance between England, Prussia, and Holland was concluded at the Hague in April 1788. In the war between Sweden and Russia in the same year, Frederick William, in conjunction with England, prevented any further attack upon Sweden by Denmark. Being jealous of the success of Russia and Austria in the Turkish war, he concluded an alliance with the Porte in 1790, and guaranteed its possessions. This measure having given offence to Austria, a Prussian army was assembled in Silesia, on the Bohemian frontier, and an Austrian army in Bohemia. The Emperor Leopold II. did not wish for war with Prussia, and in the convention concluded at Reichenbach on the 27th July, 1790, between Austria and Prussia, with the mediation of England and Holland, he promised to restore to the Turks all his conquests, except the district of Aluta, on which conditions peace was made between Austria and the Porte at Szistowe. Some differences respecting this convention were arranged by Leopold II. and Frederick William at their meeting at Pillnitz, in August, 1791, when they entered into a closer union with respect to the affairs of France.

A part of the Polish nation, with king Stanislaus Poniatowsky at its head, proposed to establish a new constitution for the kingdom, and to make the royal dignity hereditary in the house of Saxony. In order to secure foreign aid, an alliance was concluded between Poland and Prussia, by which the latter recognised the integrity of Poland, and promised to assist it with 40,000 infantry and 4000 cavalry, in case any foreign power should interfere in its internal affairs. After making peace with the Porte, Catharine II., who, without taking any share in the war then carrying on by Prussia and Austria against France, had calculated on their efforts, contrived to reduce Frederick William to the alternative either of defending Poland against Russia by virtue of his alliance with that state, or of making a second partition of it, in

conjunction with Russia. Frederick William chose the latter, and in January 1798 sent troops under General Möllendorf into Great Poland, which occupied a tract of country of the extent of 1100 German square miles, with a population, including Danzig and Thorn, of 1,200,000 inhabitants. Though the diet at Grodno was obliged to agree to this accession, as well as to a similar cession of territory to Russia, the Poles rose in 1794, under Kosciuszko and Madalinsky, to recover their independence, in which insurrection the Russians and Prussians were several times defeated, till Kosciuszko was taken prisoner on the 10th October, by the Russian General Fersen, and Praga was stormed by Suwaroff on the 4th November. Hereupon the third partition of Poland followed. All that remained, after the preceding partitions, was divided between Austria, Russia, and Prussia, by which the latter acquired a large addition of territory, and the independence of Poland was annihilated.

In the war against France, Prussia sent 50,000 men to the Rhine in 1792, under the Duke of Brunswick, and the king soon followed, accompanied by the princes. The Duke of Brunswick failed in his plan of marching to Paris, and was obliged to retreat. On the 5th April 1795, Prussia made peace with the Republic, and left all its territories beyond the Rhine in the possession of the French. To preserve the neutrality of the north of Germany, a convention was made between Prussia and several princes, whose territories were included in what was called the line of demarcation. During this reign the margrave of Anspach and Baireuth, who was the last prince of that line of the house of Brandenburg, ceded those principalities, for an annuity of 500,000 florins, to Frederick William, who on that occasion revived the order of the Red Eagle. In the internal administration, the system of indirect taxes introduced by Frederick II. was abolished. Many judicious arrangements were introduced, and a new code of laws for the whole kingdom published; but the toleration promoted by Frederick II. was much restricted by means of the religious edict of 1788 and other measures. Frederick William died on the 16th of November 1797, and was succeeded by his eldest son, Frederick William III.

FREDERICK WILLIAM III., King of Prussia, was the eldest son of King Frederick William II., by his second wife, Friederike Louise, princess of Hesse-Darmstadt: he was born on the 3rd of August 1770. Frederick William was the grand-nephew of King Frederick II., or the Great, under whose superintendence he was prepared for the important functions which he was destined to discharge on the throne of Prussia. The chief tutor of Prince Frederick William was Benish, one of the king's privy councillors; General von Backhoff instructed him in the military sciences: both are said to have been honest men, but unfit for training the mind of a youth; and well-informed writers of that period assert that the education of the prince was bad. Frederick William was sixteen when, through the death of Frederick II. in 1786, he became Crown-Prince, his father, Frederick William II., having succeeded King Frederick. During the reign of Frederick William II. Prussia lost much in general opinion.

Frederick William III. succeeded his father on the 16th of November 1797. He had already distinguished himself at Landau and Pirmasens against the French as commander of part of the Prussian avant-garde, and he had married in 1794 the accomplished Louise Auguste Wilhelmine Amalie, princess of Mecklenburg-Strelitz. At that time the Prussian monarchy contained about 124,000 English square miles, with a population of above ten millions—an area and a population three times greater than those which constituted the kingdom when the great Frederick came to the throne. But one-third of this country was formed of the provinces acquired by Prussia in the partitions of Poland, and the Polish capital, Warsaw, was then a provincial town of Prussia; from this portion of the monarchy the king derived more nominal than actual strength, and among its inhabitants there was not one in ten thousand whom he could call a loyal subject. The treasures left by the great Frederick had been squandered away by Frederick William II. in his campaigns in Holland, France, and Poland; and a considerable debt, contracted by the same king, now added to the difficulties in which the state was placed through his unwise policy. Under these circumstances, Frederick William III. turned his attention to the re-organisation of the financial department, and the introduction of a better system of administration. The changes which he effected were however far from being radical, nor were they calculated to extricate Prussia from the dangers of her political position. From the moment that King Frederick William II. had signed the peace of Basel, Prussia was caught in a net; and the favourable moment to disentangle herself by again joining Austria in her struggle against France had been neglected. Frederick William III. directed all his efforts towards upholding his neutrality in the great European struggle, and the French press was active in persuading him of the advantages of his policy. The first consequence of this policy was distrust on the part of Austria, Russia, and Great Britain towards Prussia, and still more on the part of the petty German princes, who hitherto had looked upon Prussia as their protector against the ambition of the house of Austria. But it soon became manifest that the king intended, with the aid of France, to aggrandise his dominions at their expense. He made his first acquisition by the peace of Luneville, when he received the bishoprics of Hildesheim, Paderborn, part of that of Münster, and some other territories, with an area of about 5130 English square

miles and 600,000 inhabitants, as an indemnity for some districts on the left bank of the Rhine, which had been ceded to France by the peace of Basel, and which had an area of only 900 English square miles, with 170,000 inhabitants. These territories were seized long before the decree of the diet of Regensburg (Ratisbon) in 1803, through which the partition of Germany was legally settled, and which he thus anticipated, being sure of the support of Russia and France; for as early as 1801 Frederick William adhered to the plan of the Emperor Paul of Russia to resist the English supremacy on the sea, and a Prussian ship having been carried by an English cruiser to the port of Cuxhaven, the king sent troops to that place and seized her, although Cuxhaven was within the territory of Hamburg. England was then far from wishing to have Prussia as an enemy, and, anxious to prevent a rupture with her, George III. sent his son Adolphus, afterwards Duke of Cambridge, to Berlin, to settle the affair in an amicable manner. In spite of these friendly overtures Frederick William gave way to the dangerous advice of some of his ministers, and secretly prepared for taking military possession of the electorate of Hanover and the whole German coast between Denmark and Holland. This gave rise to fresh distrust, and Prussia would perhaps as early as 1801 have felt the consequences of her dishonourable and self-seeking policy, but for the assassination of the Emperor Paul of Russia, and the friendly dispositions of his son and successor Alexander towards Great Britain, in consequence of which the convention of the 17th of June 1801 was signed, and peace restored between Russia and England. Nelson's attack on Copenhagen in April 1801 had already forced Denmark to withdraw from the Northern Coalition, and thus Prussia also was compelled to abandon her hostile designs towards England. Yet there was no real friendship between Prussia and either England or Russia, and the conduct of Frederick William towards Austria was so equivocal, that he was not only considered at Vienna as an intriguer, but as a secret enemy.

During this time the friendship between Prussia and France was strengthened, and the intercourse between the two governments and between the king and the first consul Napoleon Bonaparte was very intimate. It was however evident that when Prussia claimed anything from France, she seldom got it; but when France was the claimant, Prussia always yielded. No sooner had Bonaparte declared that the residence of so many French emigrants in the Prussian dominions seemed to be dangerous to him, than Frederick William ordered them to leave his kingdom immediately, and this order was likewise extended to Louis XVIII., who was residing quietly at Warsaw, but was now compelled to take refuge in Russia. The legitimists in Europe now treated Frederick William as a traitor to the holy cause of kings. Their astonishment was still greater when, after Napoleon had crowned himself Emperor of France, in 1804, the King of Prussia was the first of the potentates of Europe to recognise him, and to accept and bear the Grand Cross of the recently founded order of the Legion of Honour, in acknowledgment of which the king sent Napoleon the Grand Cross of the order of the Black Eagle. It seemed to be settled that the King of Prussia was to receive all northern Germany as the price of his neutrality and friendship, as soon as it could be occupied with safety. Napoleon used to speak of King Frederick William in terms of the highest esteem, but events soon showed that he despised him.

In 1805 Napoleon's designs against England were frustrated through a new coalition headed by Great Britain, Austria, and Russia. From Boulogne, where the French army had been concentrated for the intended invasion of England, it advanced by rapid marches to the frontiers of Austria. Berlin was the centre of the most important negotiations; for the king's aid seemed to promise victory to the side to which he should incline; and a large party in Prussia, tired of the king's indecisive policy, declared that Prussia had been treated with contempt by Napoleon, and that it was now time to fight against the usurper. Frederick William however still professed friendship for Napoleon; he assembled a strong army on the frontiers of Austria, but whom that army was to oppose was known only to a few. The Emperor Alexander now demanded a free passage through Silesia for a Russian army, which was either to join the Austrians in Bohemia, or more probably to occupy Hanover, and having met with a refusal, he repeated his demand in an imperious tone. The King of Prussia answered that his generals had received orders to treat any Russian who should set his foot on the Prussian soil as an enemy. There was little doubt that in this struggle also Frederick William would remain either neuter, or wait till one of the belligerent parties should have been weakened by defeats, and then join the victor and have his share in the spoliation of Austria and France. No sooner had the war broken out than the violation of the Prussian dominions in Franconia, by Marshal Bernadotte, showed how little Napoleon cared for the Prussian king—or rather, how well he knew that Frederick William was a man of indecisive character, who would not avenge an insult unless he could do it with impunity and profit. However, that insolent violation roused the war-party in Prussia; and Frederick William, always influenced by circumstances, now followed the advice of his minister the Baron von Hardenberg, and consented to an interview with the Emperor Alexander, which led to the Convention of the 3rd of November 1805; in consequence of which a Russian army was allowed to pass through Silesia, while, by a secret article of that

Convention, Frederick William promised to join the coalition against Napoleon unless he withdrew from Germany before the 15th of December. Napoleon's wrath at this unexpected news was indescribable; but being then in the heart of Austria and on the eve of a battle, he concealed his vexation. Through his intrigues however he induced Frederick William to dismiss Von Hardenberg, and to appoint in his stead Count Haugwitz, who at once hastened to the headquarters of Napoleon in Moravia. A battle between the hostile armies was unavoidable; and the general opinion in Prussia was that Haugwitz was to present his master's ultimatum to Napoleon, and either to compel him to make peace with Austria as the *status quo*, or to have a new enemy in Prussia. One hundred and fifty thousand Prussians were on the Moravian frontier, ready, as it seemed, to join the Austro-Russians, from whom they were separated only by a few days' march. No ultimatum was tendered to Napoleon. Haugwitz waited till the Austro-Russian army was annihilated by Napoleon in the battle of Austerlitz (2nd of December, 1805), and the day after the battle impudently congratulated Napoleon in the words "Dieu merci, nous avons vaincu!" "If I had lost," said Napoleon to his ministers, after Haugwitz had left him, "he would have said the same to the Emperors of Austria and Russia."

Only thirteen days after the battle of Austerlitz (15th of December 1805) a treaty was concluded at Vienna, through Haugwitz, between France and Prussia, which astonished all Europe, caused deep indignation in England, and filled all Prussian patriots with shame and despair. Prussia ceded to France her dominions in Franconia, the violation of which had caused so much indignation in Germany, and received as the reward of her duplicity the electorate of Hanover, though only *de facto*, and till a general peace to which Great Britain should be a party should be made. Hanover had been occupied by the French in 1803, against the law of nations. In that year George III. renewed the war against France as King of Great Britain and Ireland, but not as Elector of Hanover; and in order to establish that distinction, he sent a circular to the courts of Europe informing them that Hanover was out of the question, and was consequently a neutral territory. In this case however, as in so many others, Napoleon disregarded international law; and the consequence was, that Hanover was first occupied by the French, and afterwards by the Prussians. According to the condition on which Prussia was put in possession of Hanover, she could only hold it as a trustee for the Elector King George III.; but a second convention, concluded at Paris on the 15th of February 1806, showed that Frederick William intended to annex Hanover to his dominions, which he actually effected, declaring that he had received Hanover as a lawful conquest of Napoleon.

Prussia soon received the due punishment for the duplicity of her government. The first consequence of the treaty of Paris was a declaration of war by Great Britain; in a few months several hundred Prussian ships were seized by the English cruisers; and England's ally, King Gustavus Adolphus IV. of Sweden, occupied the duchy of Lauenburg, an appendage to the electorate of Hanover, for George III., and threatened to invade Prussia. However, as neither Great Britain nor Sweden was able to injure Prussia much by land, King Frederick William hoped to settle his differences with those powers and to enjoy the profits of his neutrality, but he was roused from his dreams by the insolent conduct of Napoleon, and at last brought to see clearly his dangerous position. The history of those times shows plainly that in such a contest as was occasioned by the French revolution, there was no lasting neutrality for any power which was in direct contact with French influence, and that there was no chance left but to fight for or against France. The king and statesmen of Prussia had ill understood the French revolution, and they now suffered for it.

As to the personal character of Frederick William, he was regarded as a man of plain understanding, more admired by his subjects for the qualities of his heart than those of his head, and little disposed to admire others for their talents or genius. There is no doubt Napoleon expressed his real opinion when he spoke of him with contempt, and his contempt changed into animosity in proportion as the Prussian cabinet deranged his plans without exactly thwarting them. On ceding Hanover to Prussia, Napoleon could boast of having caught Frederick William in a trap from which he could not escape without becoming either his vassal or his enemy; and matters being once in this condition, the French emperor boldly proceeded towards pushing him to extremities. The foundation of the Rhenish confederation, which, as Napoleon openly said, would be as useful to him against Prussia as against Austria, was only notified by Napoleon to the Prussian cabinet after it was completely established, though it would seem that such an union of most of the members of the German empire would not have been proposed to any of them without previously consulting Prussia, if Frederick William had been regarded by Napoleon with the respect and deference which he owed to the head of one of the great European kingdoms. Another provocation was the occupation by the new Grand-Duke of Berg, Murat, who was the brother-in-law of Napoleon, of the territories of the Prince of Nassau-Weilburg, the brother-in-law of the King of Prussia; and perhaps a direct order of Napoleon only could induce Murat to take possession of the three abbotships in Westphalia which had belonged to Prussia since 1803. In order to soothe Frederick William's anger at the establishment of the Rhenish Confederation, Napoleon, with apparent

friendship, proposed to him to form a similar union in Northern Germany; but, with still more manifest disrespect towards him, he ordered the Hanse-Towns not to adhere to the contemplated confederation, because he would take them under his immediate protection, and he secretly enjoined several princes in northern Germany to refuse any closer alliance with Prussia. At the same time Von Hardenberg, the successor of Count Haugwitz as prime minister of Prussia, was attacked in the French official newspapers; nor was there lack of articles in which Frederick William was ridiculed, or the pride of his queen provoked. The majority of the Prussian nation, headed by their queen Louisa, called loudly for war; but the king was now accustomed to neutrality, and time was required to prepare him for acting with decision. A fresh insult from France at last roused him from his state of indecision; he learned, either through his ambassador in Paris, or indirectly through the British ministers, that in the secret negotiations which were then carried on between Great Britain and France, Napoleon had promised to restore King George III. to the possession of Hanover. His language against France became now bolder, and he listened to the proposal of the Emperor Alexander, who promised to assist him with a powerful army if he would wage war with France. Under such circumstances hostilities between Prussia and Great Britain were suspended, and Frederick William sent his ultimatum to Napoleon, demanding that the French armies should immediately evacuate Germany and retire beyond the Rhine; that no German prince not belonging to the Rhenish confederation should be prevented from adhering to the contemplated Northern Confederation; and that the Prussian territories occupied by the Grand Duke of Berg should be restored to Prussia. This ultimatum was rejected by Napoleon, who stood with his main army on the frontiers of Franconia and Thuringia. The Prussian main army was in Thuringia; it was composed of troops who, down to the meanest drummer, thought themselves equal to those warriors with whom Frederick II. had resisted Europe, and it was increased by the numerous and well-disciplined contingents of the Elector and Dukes of Saxony, the Elector of Hesse Cassel, the Duke of Brunswick, and several other princes, who had concluded an offensive and defensive alliance with the King of Prussia. If King Frederick William had possessed a little sagacity, he would have discovered that his hopes rested on a rotten foundation, and that he was going to fight against the best general and the best troops in Europe, with an army whose natural courage and excellent discipline were led to the field by vanity and overbearing insolence.

The war broke out on the 1st of October 1806: a fortnight afterwards the glory of the Prussian name was prostrated on the field of Jena. The king behaved gallantly in this unfortunate battle; he had two horses killed under him, and his cloak was pierced by bullets. Another fortnight, and Napoleon I. entered Berlin. The Prussian army was annihilated: corps of 20,000 or 30,000 men, commanded by heroes of the Seven Years' War, laid down their arms to small detachments of the French. Spandau, Stettin, Cüstrin, Hameln, Glogau, opened their gates, before their walls had been touched by a cannon-shot; Magdeburg surrendered without resistance, though occupied by a garrison of 20,000 veterans, who were to defend there the great magazines of the army. "In the Seven Years' War," wrote Frederick William to his queen, "Prussia stood alone against Europe, and was often in a more dangerous position than now: we are not alone now, we have Russia." This is another instance that the fact of Prussia having been victorious in the Seven Years' War was still considered as a proof that she would always remain so: but there is a difference between talking of great things and doing them. The assistance of Russia only delayed the ruin of Prussia. In the battle of Eylau (8th of February 1807) both the French and the Russians claimed the victory; but on the 14th of June, the anniversary of the battle of Marengo, the fate of Prussia was decided in the field of Friedland. A few days afterwards Napoleon entered Königsberg, his troops pushed still farther on towards the Russian frontier, and before the month of July the whole of the Prussian kingdom was in the hands of the French, with the exception of a few fortified places, and Memel, an open town in the extreme eastern corner of Prussia Proper.

Both Alexander and Frederick William now sued for peace: separate conventions of peace had already been made between Napoleon and the German allies of Prussia, namely, Saxony and some smaller states. The town of Tilsit was chosen as the place for the ensuing negotiations. The three sovereigns were to meet on a raft constructed on the river Niemen, which formed the boundary between Prussia and Russia. The first interview took place between Napoleon and Alexander alone, on the 25th of June 1807. On the following day Alexander presented Frederick William to his victor. Napoleon was haughty, sometimes bitter; Frederick William, worn out by care, showed himself cold and reserved, speaking little, yet betraying his personal hostile feeling towards Napoleon. Some days afterwards Queen Louisa arrived, and it was expected that she would succeed, through her amiable character and ability, in bringing Napoleon down from his conditions; for it was already known that he did not intend to give back many of his conquests. But so far was she from making the slightest alteration in Napoleon's intentions, that he treated her several times rather rudely, giving her to understand that he guessed very well the motive of her presence at Tilsit.

Peace was concluded at Tilsit on the 7th of July 1807. The first article of this peace, referring to Prussia, is a proof that Napoleon not only despised Frederick William as a man, but wished to make him feel it, for the article begins with these words: "Moved by esteem for the Emperor of Russia, and in order to give a proof of his earnest desire to unite the Russian and French nations through the bonds of friendship and unalterable confidence, the Emperor Napoleon consents to give back to the King of Prussia part of his conquered kingdom." Upon this follows the description of those territories which Napoleon gave back, but not of those which the vanquished party ceded, as is generally the case in transactions of the kind; and this circumstance is another instance of Napoleon's desire to humble his unfortunate enemy. By this peace Frederick William lost the greater part of his realm; all the territories west of the Elbe, and nearly the whole of his Polish dominions—altogether about 70,000 English square miles, with a population of 6,000,000. The Polish dominions were given to the elector of Saxony, who had assumed the title of King of Saxony, as the grand-duchy of Warsaw, except the district of Bialistok, which Russia received; and thus the Emperor Alexander was rewarded at the expense of his unfortunate ally. Out of the German dominions was created the new kingdom of Westphalia, and some parts were given to Saxony and the grand-duke of Berg. The king was further required not to prevent any German prince from adhering to the Rhenish Confederation; to promise to become a member of this confederation at some future time; to reduce his army to 40,000 men, and to pay 146,000,000 of francs (nearly 6,000,000 sterling) to France. Till this money was paid French troops were to occupy Berlin and the principal fortresses of Prussia.

Thus, one terrible blow prostrated Prussia, and reduced one of the great monarchies of Europe to the rank of a third-rate power. The remaining part of Prussia was completely exhausted. Upwards of 7,000,000 sterling had been paid to France during the war under the title of contribution or fine, according to the circumstances; as much in money or in value had been taken by the French soldiery; and wherever the French had been quartered—and they had been quartered in all parts of the kingdom—the houses were burnt, the fields destroyed, the cattle killed, and the horses taken away. Under these calamities the king betrayed no symptom of despair. The re-organisation of his kingdom occupied all his thoughts. Such a sudden downfall of his power and glory at last taught him that he had laboured under a most fatal mistake, that his glory was that of his ancestors, and his power a phantom. Still at the mercy of Napoleon, he nevertheless conceived the plan of removing the causes of so much evil, and of introducing radical reforms into all the branches of administration; and he carried his plan out with a patience, a resignation, a perseverance, for which he deserved more praise than he deserved blame for his insolent conduct in the time of his prosperity. No sooner was the peace concluded than he proceeded to St. Petersburg; he afterwards lived at Memel and Königsberg till the French troops evacuated Berlin, when he returned to his capital in December 1809, after an absence of three years. Most of his ministers and many high functionaries were dismissed, and the Baron von Stein appointed prime minister. Those among the generals who had behaved like cowards in the field, or shamefully surrendered the strongest fortresses, were tried and punished; others who had behaved well were promoted, and among these were the generals Scharnhorst and Gneisenau, the regenerators of the Prussian army, and the brave Blücher, who alone saved the Prussian name from eternal disgrace, till he also was compelled to surrender to the superior forces of Bernadotte after the battle of Lübeck in November 1806. Stein having displaced Napoleon, the king was obliged to dismiss him; he appointed Von Hardenberg in his stead, who however acted in the same spirit as his predecessor. Many important reforms were effected in the internal government; among others—the last remnants of the bondage of the peasantry were abolished; the exclusive privileges of the lower nobility were taken away; government offices were thrown open, talent, learning, and merit being declared to be the only qualifications required; trade and the exercise of all mechanical arts were made free, and the existing corporations, with their exclusive privileges, were abolished; the municipal corporations in the towns received (in 1808) privileges of self-government of a nearly democratical character; the military system was radically reformed: every subject able to carry arms was declared under obligation to fight in case of necessity, and to serve in the army three years; so that, although the army was apparently only 40,000 men strong, it was really much stronger. The greatest difficulties in the reformation of the kingdom arose from the state of its finances; a system of economy was therefore introduced of which history offers few parallels. Frederick William set a noble example by selling his plate and jewellery, for which he received several millions of thalers from Hamburg merchants, and also many of the crownlands of which he was the owner; and he sent his brother William to Paris for the purpose of obtaining better conditions for the payment of the sums due to France. On the 8th of September 1808 this prince made an agreement with Napoleon's minister De Champigny, according to which Frederick William was relieved from his obligation to enter the Rhenish Confederation, and the French troops were to evacuate Prussia, on condition of 73,000,000 of francs being paid within twenty days, and twelve bills given for 72,000,000 francs, each of 6,000,000 of

france, payable monthly. Prussia being still unable to raise so much money in so short a time, another convention was made by which the debt was diminished by 20,000,000 francs, on condition that the rest should be paid in thirty-six monthly instalments. Even this obligation Prussia would not have fulfilled if the king had not declared that he could pay one half of it, feeling himself bound to do so as possessor of the crown-lands. Struggling with all these difficulties, the king approved of the plan of establishing a university at Berlin; and he showed much zeal in its foundation, which took place in 1810. He also invited distinguished men from other parts of Germany to assist him in his difficult task of regenerating Prussia: the historian Niebuhr, who deserves so much praise for his laudable conduct in this period, had entered the Prussian service as early as 1806.

During the five years that followed the peace of Tilsit, Frederick William was the mere vassal of Napoleon, who seized every opportunity of humbling and weakening him still more. The means which he employed had however sometimes the contrary effect, and in one instance he showed his anger at being disappointed in very strong terms. Napoleon had no sooner taken possession of Berlin than he issued his famous decree, by which the continent of Europe was shut against all intercourse with Great Britain, and which ordered the seizure of English goods wherever they might be found. By the treaty of Tilsit, Frederick William was compelled to give effect to that monstrous decree in his remaining dominions, although England was nearly the only country in which the Prussians could sell their corn, hemp, and timber, and Napoleon expected that as Prussia had already suffered so much during the short war with England in 1806, she would now soon lose the last chance of raising money, and thus give him a pretext to put the whole country under his administration till she should have paid her debt. Just at the time when Prussia was reduced to such a state that the royal family had no better dinner than the humblest mechanic, and the king's plate and jewels were at Hamburg to be sold, an immense quantity of English goods was discovered at Stettin, and in some other sea-ports. The Prussian officers speedily and secretly sold them, their purchasers being mostly Frenchmen, and the money thus raised—1,000,000*l.* sterling as some say, or 700,000*l.* according to others—was employed in diminishing the French debt. When Napoleon was informed of the fact, he was greatly excited, but it was then too late to seize the goods and put the money in his own purse.

In 1813 Napoleon set out on his campaign against Russia, and Frederick William was under the necessity of joining his oppressor and sending a body of 20,000 men to act against the Emperor Alexander. At Dresden Napoleon was received by a host of potentates. Among them was Frederick William, but though he was obliged to bow, he did it as stiffly as possible, spoke very little, and by his reserved behaviour increased the ill-feelings of Napoleon against him.

If Napoleon had been victorious in Russia, Prussia would have disappeared from among the kingdoms of Europe; and both Napoleon and Frederick William well knew that. The Prussian contingent fought under Marshal MacDonald, on the extreme left of the French, which was operating against Riga in the direction of St. Petersburg, and the Prussians behaved so well as to deserve the praise of their French commander. In consequence of Napoleon's retreat from Moscow, the left wing of his army retreated also, but slowly. Closely pressed by the Russians, the Prussian general York, the descendant of an English family settled in Prussia, suddenly made a truce with his Russian opponent, General Diebitch. A few days afterwards, 30th of December, they concluded the famous convention of Posarum, in consequence of which the Prussian army retreated into Prussia, and all hostilities between the corps of York and Diebitch ceased. Napoleon's wrath at this unexpected event was indescribable, and he sent a threatening letter to Frederick William, demanding that York should be deprived of his command, and be tried by a court-martial for high treason. Frederick William was then in Berlin, surrounded by French troops: he consequently declared the convention of Posarum null and void, and ordered York to be arrested. A sort of mock investigation of the case took place, but it was soon dropped, and subsequent events showed that, although perhaps without direct orders, York had acted according to the secret wishes of his royal master: it had indeed been sufficiently obvious for some time that the Prussian king was only acting with Napoleon as long as it suited his own purpose.

Frederick William hastened to Breslau, where he had an interview with the Emperor Alexander. On the 28th of February 1813, he signed a treaty of peace and alliance with Alexander at Kalisch, in Poland, but as yet no war was declared against France, and the remnants of the French army, which retreated through Prussia, were hospitably received by the inhabitants, although they brought unspeakable misery over the country. At last, on the 17th of March 1813, Frederick William, perceiving that he could do so with apparently little risk, declared war against France, and issued the famous proclamation to his subjects which roused the whole nation as one man, in arms against the foreign usurper.

In two pitched battles at Lützen, on the 2nd of May, and at Bautzen, on the 20th and 21st of May, Napoleon was victorious over the combined Prussians and Russians; but neither of these victories had any important consequences for him, and so far were the allies from being

downcast, that they retreated only a short distance, and immediately reassumed a threatening attitude. Where Napoleon did not command in person, and especially in the *little* war, the French were regularly beaten; and he accordingly listened to the proposition of Frederick William and Alexander to settle their differences peacefully. They made a truce at Pöschwitz on the 4th of June to last till the 17th of August, and a congress was assembled at Prague under the mediation of Austria, which until then had kept a strict neutrality. Both of the belligerent parties endeavoured to draw Austria into their interest, and both of them wanted time to increase their armies in case of a new outbreak of hostilities. Napoleon having peremptorily rejected the main condition of definitive peace, namely, to give up all his conquests in Germany and to withdraw with his armies beyond the Rhine, Sweden, and Austria declared for the allies; and as Napoleon had gradually augmented his forces by new levies in France, and by withdrawing 50,000 veteran troops from Spain to Germany, he broke off the negotiations, and the war commenced again on the 17th of August. The patriotic enthusiasm which first animated Prussia was then spreading over all Germany, and principally Northern Germany, whence the French had been driven out by the inhabitants immediately after Prussia's declaration of war against France; but although Marshal Davoust and General Vandamme soon brought the people again to obedience, the allies knew that they could reckon upon a general rising at the first opportunity. The forces of the allies in August have been estimated at 500,000 men, of which about 200,000 were Prussians; but this estimate is rather below than above the real number. The army of Napoleon was considerably less; but in the north Denmark had declared for him and damaged the operation of the allies on that side. On the 27th of August Napoleon gained another victory at Dresden; but having advanced upon Bohemia, part of his army was entirely routed at Kulm by the Russians, and at Nollendorf by the Prussian general Kleist. Upon this the hopes of Napoleon were blighted by one defeat after another, and in the battles of Grossbeeren, Dennewitz, Katzbach, Görde, and many others, the Prussians and their brave commander Blücher restored the honour of their arms, and reduced Napoleon to a most critical position in the neighbourhood of Leipzig. In the battle of Leipzig the French power was broken, or rather in three successive battles on the 16th, 18th, and 19th of October, and there again Blücher and the Prussians obtained the greater share of glory. It was on the 18th, in the evening, when Frederick William and the Emperors of Austria and Russia met on a hill near Probstheida, where the centre of the French position had been, and descending from their horses, embraced each other in the presence of their soldiers, and kneeling down, remained long in silent prayer. From Leipzig the remnants of the French army fled to the Rhine. The passage of the Rhine was effected by Napoleon on the 2nd of November. Frederick William, urged by Blücher, advised the allies to invade France, but there was a contrary opinion at head-quarters, and two months were spent in inactivity before at last the Russo-Prussians crossed the Rhine on the 1st of January 1814. The beginning of the campaign in France was signalized by the battles of Brienne and La Rothière, where Blücher once more obtained an advantage over Napoleon. Frederick William and Alexander were witnesses of the battle at Brienne. During the subsequent negotiations at Châtillon Frederick William appeared to be satisfied with moderate conditions, but Napoleon was victorious in several battles that were fought during the negotiations, and the French plenipotentiaries withdrew from Châtillon.

The allies now agreed by the convention of Chaumont that they would make no peace till France was reduced within her former limits; that Austria, Russia, and Prussia should employ all their forces to that effect, and keep each, for the period of twenty years after the peace, an army of 150,000 men ready to enforce the conditions of such a peace, and that Great Britain should pay 5,000,000*l.* sterling. There was still a doubt at the head-quarters of the allies whether they should march upon Paris or not, the operations of Napoleon in their rear seeming to render such movement very dangerous, but Frederick William, at the instigation of Blücher, constantly urged the necessity of finishing the war at Paris, and so at last the great task was undertaken. On the 9th and 10th of March Blücher defeated Napoleon at Laon, Prince Schwarzenberg was victorious at Arcis-sur-Aube, and their united armies gained another battle at La Fère Champenoise. A few days afterwards they stormed the fortifications round Paris, and gained the battle of Mont-Marte, and on the following day, the 31st of March, Frederick William and Alexander made their triumphal entry into Paris. On the 2nd of April Napoleon was deposed by the Senate.

After the restoration of the Bourbons, Frederick William in company with the Emperor Alexander, several members of the Royal Prussian family, and the old field-marshal Blücher, paid a visit to England, where they were most enthusiastically received. After a short stay in England he returned to Prussia, and made his triumphal entry into Berlin, and thence proceeded to the congress at Vienna, to take his seat among the distributors of the provinces ceded by France at the peace of Paris. There he claimed his former possessions, except the greater part of his share in the division of Poland, which he consented to leave to Russia, but with his usual unscrupulous selfishness, he demanded, as an indemnity, the whole kingdom of

Saxony. The king of Saxony, Frederick Augustus, was then Frederick William's prisoner of war. Frederick William was supported in his views by the Emperor Alexander. Both of them took so menacing an attitude in this affair, and met with so firm a resistance from the king of Saxony, as well as other potentates, that serious fears were entertained of a rupture between Prussia and Russia on one side, and Austria, Great Britain, and France, on the other, but the return of Napoleon from the island of Elba produced a salutary effect among the members of the congress, and Frederick William was obliged to be satisfied with the larger and northern half of the kingdom of Saxony. Besides this acquisition he received back the most western part of Poland, under the name of the grand-duchy of Posen, nearly all his former possessions in Germany, and several other parts of that country, namely, a large tract on both sides of the Rhine and the greater part of Westphalia. He also acquired Swedish Pomerania by exchange for Lauenburg, but left several small districts in the hands of some of the minor German princes. Comparatively speaking, however, Prussia acquired less than the other great northern powers, since the area of the kingdom as fixed by the treaty of Vienna was less than previous to the peace of Tilsit, and besides this the Prussian dominions were now divided into two large portions separated from each other by a small narrow tract belonging to Hanover and Hesse-Cassel.

Blücher at the head of a powerful Prussian army was ready to resist Napoleon, after his return to Paris in 1815, in the Netherlands. Against him Napoleon aimed his first blow at Ligny, on the 16th of June, and Blücher lost the day, but the spirit of the Prussian army was so excellent, that Blücher retreated in good order upon Wavre, kept his word to aid the Duke of Wellington at the battle of Waterloo, and had his glorious share in that great victory, by which the power of Napoleon was broken. Frederick William followed his army to Paris, and there signed with the other powers the second peace of Paris. To the proposition of the Emperor Alexander of forming that union called the Holy Alliance, Frederick William adhered with eagerness.

After his return, Frederick William undertook the difficult task of organising a kingdom composed of incongruous parts, and exhausted by oppression, rapine, war, and its great exertions. His intellectual capacities were very limited, but he had plain sense, loved and knew how to create order, and, guided by long and bitter experience, displayed considerable ability in selecting his measures, and in choosing his servants among men whose principles promised a quiet and peaceable development of that state of things which he had in view. In a few years the finances were brought to a flourishing condition; trade, mechanical arts, agriculture, were promoted by liberal laws, and where laws were not sufficient the king would help with money from his own purse, lending or giving large sums to the great land-owners in Eastern Prussia, when the high rate of the corn duties in England produced a stagnation of the corn trade in that province, and momentarily deprived the owners of immense estates of the means of paying taxes or their creditors, or even living decently. Nor was he less active in reforming the administration of law and the post-office, in constructing roads, and in founding universities, colleges, and schools. The people however looked to him for civil and political freedom as well as for material improvements. Their claims were the more just as they were not only founded upon their social wants, but upon rights also; their rights being derived not merely from the eighteenth article of the Confederative Act, but still more directly from Frederick William's edict of the 22nd of May, issued after the return of Napoleon from Elba, and before the battle of Waterloo had removed all fear of France, wherein he promised to establish a general representative constitution for the whole kingdom. But whatever were his intentions when he issued that edict, he never fulfilled the smallest portion of it. The reasons why Frederick William III. broke his solemn promise must be found in his character. A real representative constitution which should give the nation a participation in the legislation, was a thing utterly detested by Frederick William. He was a king brought up in the old German doctrines of absolutism. He would be the father of his nation, the master in his house, and he expected from his subjects that sort of obedience which boys owe to their father and servants to their master. Like a good father he gave his children a good education, allowing them all sorts of amusements and liberty, and paying even their little debts occasionally; but he wanted all their actions to be confined within the limits prescribed by himself, and any claim to go beyond he would punish with angry words or the paternal cane, according to the case. When Frederick William promised a constitution he did not perhaps precisely know what it was; at least this is the excuse which has been offered for him: yet it would seem to be the most obvious duty of a sovereign to ascertain what he really meant before pledging his royal word to give his people a representative constitution.

The first to remind Frederick William of his promise were the inhabitants of the Rhenish provinces. Early in 1813 the inhabitants of Coblenz presented an address to the king in which they humbly established the justice of their demand on the ground of the 18th Article of the Confederative Act, and the edict of the 22nd of May 1815. The king professed to be "justly indignant" at their temerity.

He told them that—"He who reminds the king, who has voluntarily promised a constitution, of his word, manifests criminal doubts of the inviolability of his word, and anticipates his decision on the right time of its introduction; a decision which ought to be as free as was his first promise;" and with this wretched quibbling the pious monarch contrived to satisfy his conscience. Of course "the right time" never came, and though the king lived for five-and-twenty years, and the country was peaceful and flourishing, he never made an effort to fulfil the promise made with every character of solemnity to the people, who had done so much for him and had suffered so much from his vacillating, feeble, and time-serving policy.

While Frederick William thus evaded his promise to grant constitutional liberties to his subjects, he did what he could to check the spirit of liberalism in other parts of Germany; and he was especially active in restraining the liberty of the press, and putting down the secret societies among the students in the universities, especially the society called 'Burschenschaft,' the object of which was the gradual regeneration of Germany, and the political independence of the whole nation under one government. In 1820, and in the following years, the continental kings held successively the congresses of Troppau, Laibach, and Verona, where measures were taken against the political movements in Italy and Spain, and here again Frederick William showed that he hated representative constitutions in those countries no less than in his own. Prussia was astonished and indignant at this conduct in a king who owed his crown and his glory, nay his very honour, to promises of political liberty. Between the reactionary and the liberal party the king was wavering for some time, with his accustomed want of decision in complicated matters, till he fell in with the Protestant pietists. From this time the spirit of the Prussian government became what it is now still more, a sort of Jesuitical despotism, dressed in the smooth garb of piety and philosophy. He adopted despotic measures of a most revolting character. One of the most glaring instances of the spirit in which his government was carried on was the forced union of the Lutheran and Reformed churches, or the introduction of the new 'agenda,' as it was gently called, a violation of the liberty of conscience which in another age would have led to a religious war. The persecutions by which Frederick William's government attained their object were numberless, but there is no space here to dwell longer upon the subject. Contemporary with this ecclesiastical reform was the establishment of the 'Landstände,' or provincial estates, a sort of middle-age representation of the people in each province, but not a general representation of the whole nation.

Small as the political liberties of Prussia were, and vexatious as the military system was which reigned throughout the whole administration, a period of fifteen years was sufficient for Frederick William and his councillors to raise Prussia again to the rank which she occupied among the powers of Europe previous to the battle of Jena. In her exterior relations Prussia behaved with prudence and generally with dignity. The object of Frederick William was to make Prussia powerful, and he succeeded. Peace was the great object he had constantly at heart, and he maintained peace even through the dangers occasioned by the French revolution in 1830. Though averse to the principles of the French Revolution, he contented himself with keeping the French within France, by declaring that he would make common cause with Austria and Russia against her from the moment the French made their cause a European one by continuing to revolutionise Europe through her emissaries. He had to experience the dangers of the French Propaganda in a riot at Aix-la-Chapelle, which was the first and also last outbreak of a plot to revolutionise the Rhenish provinces. But while adopting towards France a passive policy, he was ready enough to assist Russia in crushing revolutionary principles in Poland. During the last Polish revolution he not only supplied the Russian army with provisions and military stores, but allowed the Russian generalissimo, Field-Marshal Paskiewicz, to cross the Vistula on the Prussian territory, which enabled him thus to attack Warsaw and to put down the insurrection. A great number of Polish subjects of Frederick William, having joined the army of their brethren in Russia, were severely punished when they returned to Prussia after the fall of Warsaw.

Towards the end of his reign Frederick William committed an act which created a great sensation in Europe, by arresting and imprisoning the archbishops of Cologne and Gnesen, for instructing the Roman Catholic priests to withhold their sanction from marriages of Roman Catholic women to Protestant husbands, in violation of the concordat of 1820 between Pope Pius VII. and Frederick William III., by the terms of which the issue of mixed marriages was to follow the religion of the father, unless the parents agreed otherwise. The affair was only settled at last between the pope and the present king in such a way as to leave no doubt that Frederick William had acted imprudently as well as unjustly in this matter. His policy in promoting the material welfare of his subjects was wiser, and never were the trade, manufactures, agriculture, and navigation of Prussia in so flourishing a condition as towards the close of his reign. He attained his object in a great measure by concluding the great commercial league with most of the other German states, the plan of which was originally conceived by the minister of finances, Mr. Von Maassen, and which is known under the name of the 'Zollverein.'

Broken down by the infirmities of age, Frederick William III. died after a short illness on the 7th of June 1840. He was twice married. By his first wife, Louisa of Mecklenburg-Strelitz, he had four sons, the eldest of whom is the present King Frederick William IV., and three daughters. His second wife was Augusta, countess von Harrach, created Princess of Liegnitz, with whom he was united in 1824 in morganatic marriage, and by whom he had no issue.

*FREDERICK WILLIAM IV., King of Prussia, was born October 15, 1795, and succeeded his father on June 7, 1840. He married Elisabeth Louisa, daughter of the late Maximilian Joseph, king of Bavaria, on November 29, 1823, but has no children. Frederick William received a careful education under the historian Niebuhr, and other of the most eminent men of Germany, and has always encouraged literature and the arts. After his father's death he made himself popular to a certain extent by conceding some minor reforms and talking of others. On the breaking out of the revolutionary mania in March 1848 however he took a new course. On the 22nd of that month, after some severe fighting between the troops and the citizens at Berlin, the king issued a proclamation in the Gazette, recommending the cordial union of German princes and people under one guiding hand, offering himself to be that guide; the fusing and dissolving the name of Prussia into that of Germany; and abolishing the censorship of the press, placing its offences under the ordinary tribunals. The populace assembled in delight; an accidental quarrel arose with the soldiery, more blood was shed, but the king had the prisoners released, nominated a popular ministry, and proclaimed a general amnesty, and again all was tranquil. He next undertook the protection of Schleswig and Holstein against the Danes, in the name of the Provisional Government of Germany. But after the Constituent German National Assembly at Frankfurt elected the Archduke John lieutenant-general of Germany, Frederick William's ardour cooled. He refused to give or consent to a constitution for his own people, saying with a mock sentimentality that he would not have "a piece of paper come between him and his people;" and the chief events in his course since have been the intrigues in the German Diet to oppose the superiority of Austria, and the refusal to take any active part in the late contest against Russia, though early in the controversy he had declared Russia in the wrong for her attack on Turkey.

His nephew, Frederick William, visited England in 1856, as the suitor of the Princess Royal.

FREDERICK AUGUSTUS I., King of Saxony, eldest son of the Elector Frederick Christian, born at Dresden on the 23rd of December 1750, succeeded his father on the 17th of December 1763, under the guardianship of his uncle Prince Xavier, till he assumed the government in 1769. In 1769 he married the Princess Maria Amelia of Deuxponts. He began his reign with a firm resolution, to which he remained faithful under all circumstances and at all times, to do everything in his power to promote the happiness of his people. In the whole of his long reign there was no act of despotism, or violation of the rights of others. Averse from innovation, he undertook nothing through ostentation or mere imitation, but new institutions arose only when he had become convinced of their utility. He gradually diminished the debts of the country; and the strict integrity of his administration caused the Saxon funds, though the interest was low, to be several per cent. above par. He often prevented the country from contracting debts by personal sacrifices, endeavoured to decrease rather than to raise the taxes, and never suffered his interest and that of his treasury to be opposed to the interests of his subjects. During the dreadful dearth in 1772, 1804, and 1805, and the inundations in 1784, 1799, and 1804, the king gave particular proofs of his paternal care for his people. Agriculture, the improvement of the breed of cattle, especially of the sheep, made considerable progress, and were encouraged by premiums. The mines, the salt-works, and the forests were improved by careful superintendence and wise laws. Manufactures were encouraged; commerce, which had suffered severely during the Seven Years' War and by the duties imposed during his minority upon foreign goods, became flourishing to a degree hitherto unknown. The army was placed upon a better footing, excellent institutions were established for the education of officers, and a military penal code was compiled. Extensive support was given to the universities of Wittenberg and Leipzig, the schools of Pforta-Meissen and Grimma were reorganised, the seminaries at Dresden and Weissenfels, the institutions for the sons of soldiers at Annaberg, and the elementary mining-schools in the Erzgebirge were founded, and the mining-academy at Freiberg better organised. In his legislation Frederick's government appears in a very favourable light. Torture was abolished in 1770; the number of oaths in courts of justice was diminished; the punishment of death restricted and made less cruel. Important changes were also made with respect to several public boards; salutary police laws and a general ordinance on guardianship were issued; orphan-houses, workhouses, dispensaries, &c. were founded. The spirit of integrity, order, temperance, and fidelity so generally prevailed, that Saxony was eminently distinguished for the morality of its inhabitants. Notwithstanding his love of peace, he was more than once obliged to take part in the wars of other powers. Thus, in 1778, the claims of his mother on the succession of her brother the Elector of Bavaria, made him join Frederick the Great against Austria. The welfare of his country and its geographical position required him to be united

with Prussia, on which account he joined the Fürstenbund. Similar considerations induced him to refuse the crown of Poland, which the Poles offered to him and his successors in 1791. He took no part in the war against France further than furnishing his contingent as a prince of the empire; and in 1796 he acceded to the armistice and treaty of Neufchatel with France, and stationed a cordon of troops on the line of demarcation, on his southern frontier. He took no part in the new war between Austria and France in 1805; but when the German empire was dissolved, on the 6th of August 1806, he was obliged to furnish Prussia with 22,000 men against France. After the battle of Jena, Saxony was abandoned to the French. Napoleon, besides various requisitions, levied a contribution of 25,000,000 of francs, and established a provisional administration of the sequestered revenues, but allowed the country to remain neutral; and its fate would doubtless have been very different but for the respect with which the private and public virtues of the king inspired even his enemies. Frederick assisted his distressed subjects from his private property, concluded a treaty of peace with Napoleon at Bonn in December 1806, assumed the title of king, joined the Rhenish Confederation, and furnished 20,000 men as his contingent. By the treaty of Tilsit in 1807 he obtained a large portion of Prussian Poland, by the name of the grand-duchy of Warsaw. He was bound to take part with France in its wars, but sent no troops to Spain; and in the war with Austria in 1809 he furnished only his contingent. In 1813 his dominions became the theatre of war. On the entrance of the allies into Saxony he retired to Plauen, thence to Ratisbon, and thence to Prague; but the menaces of Napoleon compelled him to return to Dresden; he afterwards followed Napoleon to Leipzig. That town being taken by the allies after the defeat of the French on the 18th and 19th of October, Alexander intimated to him that he considered him as a prisoner. The act of spoliation which followed is well known. In spite of his remonstrances and representations, and of the high estimation in which his character was held, he was deprived of a large portion of his kingdom, which was given to Prussia under the title of the grand-duchy of Saxony. He returned to his capital on the 7th of June 1815, founded, in commemoration of that event, the order of Civil Merit, and devoted all his attention to repair the injuries caused by the war. In September 1818 he celebrated the fiftieth anniversary of his assuming the government, and in January 1819 that of his marriage. He died on the 5th of May 1827, in the seventy-seventh year of his age and the sixty-fourth of his reign.

FREDERICK AUGUSTUS I. OF POLAND. [AUGUSTUS II.]

FREDERICK AUGUSTUS II. OF POLAND. [AUGUSTUS III.]

FREDERICK WILLIAM, Duke of Brunswick, the fourth and youngest son of Charles William Ferdinand, was born October 9, 1771, and educated for the military profession. In 1786 the king of Prussia named him successor of his uncle Frederick Augustus, duke of Oels and Bernstadt, who died in 1805. He went to Lausanne, spent two years in Switzerland, and on his return was made captain in a Prussian regiment of infantry. In 1792 he was with the Prussian army in France, and was twice wounded. After the peace of Basel he obtained a regiment, and in 1804 married the princess Mary of Baden, by whom he had two sons, Charles and William. After 1806 he took part in the war against France, with all the ardour which the oppression of Germany and his father's unhappy fate inspired. He was taken prisoner with Blücher at Lubeck. His eldest brother the hereditary duke dying without children in September 1806, and his two other unmarried brothers having been declared incapable of reigning on account of incurable blindness, he would have succeeded to the government of Brunswick on the death of his father; but the peace of Tilsit and the will of Napoleon decided otherwise. From that time he lived at Bruchsal, where he lost his consort in April 1808. At the beginning of the war between France and Austria, in 1809, he raised a free corps in Bohemia. After the total defeat of the Austrians, the duke resolved to leave Germany, and with a corps of 700 cavalry and 800 infantry, commenced in July that memorable and masterly retreat which gained him such deserved reputation. After some skirmishes he reached Brunswick on the 31st of July, but did not enter the city. There was no time for rest; three bodies of troops, each much more numerous than his own, were advancing against him. On the 1st of August the Westphalian general Reubel met the duke at the village of Oelper, near Brunswick, and a battle ensued, in which Reubel's 4000 men not only yielded to the 1500 Brunswickers, but left the only way open by which they could escape.

By a series of skilful manoeuvres the duke deceived his pursuers, crossed the Weser, broke down the bridge behind him, and having completely baffled his enemies, reached Elsfeth on the 6th of August, where he took possession of a sufficient number of vessels in which he embarked his troops during the night, and on the 7th in the morning, hoisting English colours, sailed for Heligoland, where he arrived on the 8th, and on the 10th proceeded with his corps to England. He was received in England with the greatest joy; his troops were taken into the English service and employed in the Peninsula, where they distinguished themselves. The duke had a pension of 6000*l.* a year granted by the parliament till he returned to his own dominions in December 1813, where he was received with extraordinary enthusiasm, and with expectations which he was unhappily unable to fulfil. He was one of the most liberal and noble-

minded princes of his age. He was sincerely desirous of promoting the welfare of his subjects; but, wanting to accomplish it at once, he overlooked the ordinary forms: finding nothing to support him in the constitution of the country, which had been completely changed, and being surrounded by interested or prejudiced counsellors, numerous mistakes were committed. His military establishment was too great for the dilapidated state of the finances, and indifference, if not aversion, took the place of the affection of his people. The rest is known. With his famous Black Hussars he joined the Duke of Wellington in 1815, and fell gloriously at Quatre-Bras on the 16th of June 1815.

FREDERICK WILLIAM CHARLES, King of Württemberg, was born at Treptow, in Pomerania, November 6, 1754; succeeded his father, Frederick Eugene, as Duke of Württemberg in 1797; became elector in 1803; and assumed the royal title on the 1st of January 1806. In 1780 he married Augusta Caroline Frederica Louisa, princess of Brunswick Wolfenbüttel, by whom he had two sons, William, the present king, and Paul, and a daughter Catherine, who was married to Jerome Bonaparte, king of Westphalia. As his father was personally engaged in the Seven Years' War in the armies of Prussia, his early education was very carefully directed by his mother, Sophia Dorothea, daughter of the Margrave of Brandenburg-Schwedt, a highly accomplished and excellent princess. After the peace in 1763 his father was at leisure to attend to the education of his son, who possessed great natural abilities. He was however brought up in many respects on the French model, to which his four years' residence at Lausanne contributed. His natural eloquence was aided by an extraordinary memory; he was well versed in mathematics, natural philosophy, history, and geography, and cultivated his taste for the fine arts, especially in his journey to Italy in 1782; but with too much vivacity for calm examination, he often hastily adopted a false view, and was thus led in his subsequent life into many errors. In many points he took Frederick the Great for his model. As well as his seven brothers he entered the Prussian service, and in the war of the Bavarian succession attained the rank of major-general. After his return from Italy, whither he accompanied his sister and her husband the Grand Duke Paul of Russia, he was made lieutenant-general, and governor-general of Russian Finland. He renounced this connection in 1787, and lived first at Monrepos, near Lausanne, and then at Bodenheim, near Mentz. He witnessed at Versailles the first proceedings of the National Assembly. When his father, after the death of two brothers without male descendants, became Duke of Württemberg in 1795, Frederick, as crown-prince, opposed in 1796 the entrance of the French into Franconia, but was defeated. After this event he lived for a time at Anspach, then at Vienna and London, where in 1797 he married Charlotte Augusta Matilda, princess-royal of England, with whom he returned to Stuttgart in June the same year.

When he succeeded to the government in December 1797, his duchy, which had already suffered severely in the war with France, was 153 German (about 3000 English) square miles in extent, with 600,000 inhabitants. Frederick, by his interest at the courts of Vienna and St. Petersburg, obtained by the decision of the German diet of the 23rd of February 1803, besides the electoral dignity, an ample indemnity for his loss of territory on the left bank of the Rhine. The chief object of his policy was to preserve and extend his dominions. On the 2nd of October 1805 Napoleon arrived at Ludwigslust, and on the following day issued the declaration of war against Austria. Frederick was compelled to join France, and furnished 8000 men. By steadily adhering to the system of Napoleon he acquired in and after the peace of Presburg the possession of an independent kingdom of the extent of 368 German (nearly 7400 English) square miles, with 1,400,000 inhabitants. After he had assumed the title of king, on New Year's Day 1806, he published the organisation of his greatly-enlarged dominions, by which a uniform system of administration was introduced into the old and new provinces. Desirable as this might be (and he is highly commended for it by some writers), it certainly did not give satisfaction to his subjects. Accustomed, and indeed compelled, to act with energy in his foreign affairs, he sought to make everything in his internal government bend to his will, without regard to long-cherished prejudices or even to long-established rights. He joined the Rhenish Confederation, was at the meeting of Napoleon and Alexander at Erfurt in October 1808, and in the campaign of 1812 furnished his contingent as member of the confederation. After the battle of Leipzig he formally renounced, in November 1813, the Rhenish Confederation, and joined the allied powers against France. He went in person to the congress at Vienna, where he was received with great respect by the assembled sovereigns. In the thirteenth article of the Act of Congress it was enacted that representative assemblies should be introduced into all the states of Germany—a benefit for which Germany is in great measure indebted to the Prince-Regent of England. The king of Württemberg (though he did not accede to the German Confederation till the 1st of September 1815) drew up a constitution, which he presented as an ordinance to the states which he had convoked; but it was unanimously rejected: the deputies required the ancient constitution, and speedy relief for the miseries of the people. Accustomed to implicit obedience, and not a little astonished at this behaviour, he still redressed many grievances, and after dissolving the assembly in August 1816, he called another

in October, and unexpectedly prescribed fourteen propositions as the basis of a constitution, which were favourably received by the people. A new constitution was drawn up; but before it could be discussed he died, on the 30th of October 1816, in the sixty-second year of his age and the nineteenth of his reign. His character was essentially despotic, but he had too much good sense and too enlightened an understanding to be systematically a tyrant. He desired the good of his people, though of the means of promoting that he conceived himself to be the best judge. It must be said to his praise that his edict of the 15th of October 1806, secured to all his Christian subjects equal security for their rights and the free exercise of their religious worship. He introduced neither French laws nor French forms of administration; everything in Württemberg remained German; and Württemberg was happily preserved from the degradation of becoming a French province.

FREDRO, MAXIMILIAN, palatine of Podolia, a celebrated Polish author, who died in 1676. He spent his life in serving his country, in the camp as well as in the council, and occupied many important posts. His active life gave him excellent opportunities for making observations on many subjects connected with war and politics; which he has transmitted to posterity in his works, which are chiefly in Latin. His writings are full of interesting details, his observations are shrewd, and his opinions on various subjects are remarkably sound; whilst the vigour and conciseness of his style procured for him the name of the Polish Tacitus. His principal works are—1, 'Vir Consilii monitis ethicorum, nec non prudentiæ civilis descendum instructus'; 2, 'Monita politico-moralia et icon ingeniorum'; 3, 'Militarium seu axiomatum belli ad harmoniam togæ accommodatorum libri'; 4, 'Fragmenta Scriptorum togæ et belli'; 5, 'Considerations on the Military service,' in Polish; 6, 'Proverbs and Advice, moral, political, and military,' in Polish. This last work, which is very popular in Poland, has mainly contributed to establish the reputation of Fredro, who has here displayed an extraordinary knowledge of the world, and an intimate acquaintance with the habits and character of all ranks of society.

* FREILIGRATH, FERDINAND, a distinguished German poet, was born June 17, 1810, at Detmold, in the German principality of Lippe. His father was a teacher, and gave him his first instruction. He afterwards studied in the gymnasium of his native town. In 1825 he was placed in the counting-house of a merchant at Soest, in Westphalia. From 1831 to 1836 he was employed in a banking-house at Amsterdam, and from 1837 to 1839 in a merchant's house at Barmen, in the Prussian Rhein-Provinz. His earliest poems were published in the journals of Westphalia, and in the 'Musen-Almanach' for 1835. The first collected edition of his poems was published at Stuttgart in 1838, and the earliest poems included in it have the date of 1826. Freiligrath's 'Gedichte' consist of about two-thirds of original lyrical poems, and one-third of translations. The original poems are distributed by the poet into Day-Book-Leaves ('Tagebuchblätter'), Ballads and Romances, Terzines, Alexandrines, Mixed Poems, and Occasional Poems; the translations are from the French and English, the largest number of the latter being from Scott and Moore. The reception of his poems was so favourable that he resolved to relinquish his commercial employments, and devote himself to poetical literature. He then lived mostly near the Rhine, and at Unkel became acquainted with his present wife, a native of Weimar, and then a governess with an English family. He married in 1841, and after his marriage removed to Darmstadt. In the year 1842 the King of Prussia granted him a yearly pension of 300 thalers (about 44*l.*), after which he returned with his family to the Rhine, and lived about two years at St. Goar.

There had existed for some years in Germany, especially in the Prussian Rhine-Provinces, a large party very decidedly opposed to the government on account of the censorship of the press and other restrictive and arbitrary measures. Freiligrath had become attached to this party, and had written and shown to his associates several poems expressive of his political opinions and feelings. In opposition to the advice of some of the more prudent of his friends, he resolved to make a public profession of his political belief by the publication of these poems; and as he would thus place himself in direct opposition to the government of the King of Prussia, he considered that he had no longer any claim on the royal bounty, and resigned his pension. In 1844 he published his volume of political poems under the title of 'Ein Glaubensbekenntnis; Zeitgedichte,' &c. ('A Confession of Faith; Poems of the Times,' &c.) The impression made by these poems was sudden and extensive; within a few days the book was in circulation throughout the whole of Germany, and excited among the liberal party the greatest enthusiasm. As might have been expected, the censorship ordered the book to be suppressed, and the government commenced a prosecution against the author. He therefore took the prudent course, and left Germany in the autumn of 1844; he resided in Belgium, in Switzerland, and lastly in London, where he resumed his original occupation of a clerk in a banking-house. In 1845 he published a translation into German of the Lyrical Poems of Victor Hugo, and in 1846 a volume of poems translated from recent English writers, 'Englische Gedichte aus Neuerer Zeit, nach Felicia Hemans, L. E. Landon, Robert Southey, Alfred Tennyson, Henry W. Longfellow, und Anders,' &c., Stuttgart

and Tübingen. The preface is dated Zürich, in the spring of 1846. In this year he also published the first of six political poems, to which he gave the French revolutionary title of 'Ça Ira'. In the early part of 1848, on the invitation of Mr. Longfellow, he had arranged to go to the United States; but the revolutionary struggle of that year, which his political poems had doubtless contributed to produce, induced him to return to Germany. He stationed himself at Düsseldorf, became an active member of a political club there, and in consequence of the reactionary measures of the government after the revolution had terminated, published a poem entitled 'Die Todten an die Lebenden' ('The Dead to the Living'), the dead being the insurrectionary leaders slain at the barricades in Berlin in March 1848. For the publication of this poem an action was brought against him by the government: he was tried at the assize-court in Düsseldorf, by a jury of twelve sworn men, and was acquitted October 3, 1848.

After his acquittal Freiligrath removed to Cologne, and assisted in the editorship of the 'Neue Rheinische Zeitung,' contributing also to the literary department of the paper. While thus engaged he published a small collection of poems under the title of 'Between the Sheaves' ('Zwischen den Garben'), a Gleaning of Poems of a former Date, 1849, and a translation of Shakspeare's 'Venus and Adonis,' 1850. The periodical on which he was engaged was discontinued about this time, and he then returned to Düsseldorf. He had issued in 1848 the first number of 'New Political and Social Poems,' and in 1851 produced a second number, but had no sooner done so than he was threatened with another government prosecution. The liberal party in Germany had now become weak, and under the circumstances he deemed it prudent to withdraw from the continent. He again came to London, where, we believe, he still resides with his wife and children, plying the pen of a banker's clerk as his chief means of subsistence, but not entirely relinquishing his literary occupations.

Freiligrath's 'Gedichte,' first published in 1833, had reached the 16th edition in 1855. These poems are strikingly original, bearing little or no resemblance to those of any previous German poet. They are founded sometimes on scenes and objects which had fallen under his own observation, sometimes on the descriptions of travellers, and sometimes they are pictures furnished by his imagination; they have no reference to himself, his own circumstances, or his own feelings, but present animated images of the scenes, objects, and beings, not only of Germany and Holland, but of Africa and America. His conceptions are always distinct, and his expression glows with the warmth naturally produced by a vivid imagination. There is occasionally something of wildness, but no weakness, and now and then the images are coarse and even unpleasant, but they are always founded on the realities of actual existence. When Freiligrath assumed the character of a political poet he appears to have done so from an earnest sense of duty; and his poems of this class are the outpourings of a generous and enthusiastic spirit, vigorous and often vehement, but even when satirical, without spleen, or bitterness, or unfair exaggeration. His translations from the English are numerous, and not only give the sense correctly, but exhibit the spirit, and imitate the rhythm.

(*Deutsche Literaturgeschichte der Neuern Zeit, in Biographien, Kritiken, und Proben*, 16mo.)

FREINSHEIM, JOHN, was born at Ulm in 1603, and studied at Strasbourg, where he became librarian to Matthias Bernegger, a wealthy philologist, who gave him his daughter in marriage. He was afterwards appointed professor of eloquence in the University of Upsal, where he remained five years, after which he was made librarian to Queen Christina, with a handsome salary. But his health and the rigour of the climate of Sweden obliged him to return to Germany in 1656, when the elector palatine appointed him honorary professor in the University of Heidelberg, and his councillor at the same time. He died at Heidelberg in 1660. Freinsheim wrote a supplement to Livy, with the intention of replacing the lost books of that historian. The first part of this work was published at Strasbourg in 1664, and the remainder appeared in Doujas's edition of 'Livy ad usum Delphini.' Freinsheim endeavours to imitate Livy's style, and he regularly quotes the authors from which he derived the materials for his narrative. He also wrote a 'Supplement to Quintus Curtius,' besides a 'Commentary' on the same writer, as well as on Florus and Tacitus. Freinsheim wrote also: 'De calido potu Dissertatio,' 'De Præcedentia Electorum et Cardinalium,' and other learned works.

*FREMONT, JOHN CHARLES, was born on the 21st of January 1813, in the city of Savannah, in the state of Georgia, North America. His father was a Frenchman, his mother a native of the state of Virginia. His father died while Fremont was very young, but his mother, though poor, managed to procure him a good education in the city of Charleston, South Carolina, where she had taken up her residence. He entered the junior class of Charleston College in 1828. For some years after he left the college he supported himself and assisted his mother by teaching mathematics, and was so occupied in 1833 on board the *Natches* sloop of war. He was afterwards employed as a surveyor and railroad engineer, under Captain Williams of the Topographical Engineers. From 1833 to 1838 M. Nicolet, a scientific tourist, had occupied himself in exploring an extensive

portion of country west of the upper branches of the Mississippi, and at the termination of his amateur travels the government of the United States engaged him to extend his journeys into a more distant part of the territory. Fremont was then associated with him to assist him in his surveys, and he was thus employed during the years 1835 and 1839. After his return Fremont became acquainted in the city of Washington with Mr. T. H. Benton, who was for many years one of the two senators sent to Congress from the state of Missouri, and in 1841 married one of Mr. Benton's daughters.

Fremont while absent with M. Nicolet was appointed a second lieutenant in the corps of Topographical Engineers, and was soon afterwards directed by Colonel Abert, the chief of that corps, to explore and report upon the country between the frontier of the state of Missouri and the South Pass in the Rocky Mountains. The expedition left the city of St. Louis on the Mississippi at the end of May 1842, and proceeded by steamboat up the Missouri to the mouth of the Kansas, which they left on the 10th of June. Passing up the Kansas about 100 miles, and then by its tributaries, they arrived at the Great Platte 200 miles from its junction with the Missouri. They then followed the north fork of the Platte, and reached the mouth of the Sweet-Water River, one of the head waters of the Platte. The Sweet-Water runs along a sandy plain, generally about five miles wide and bounded by granitic mountains. This plain, 120 miles long, conducts by a very gradual ascent to the summit of the South Pass, 7490 feet above the sea, whence the waters flow westward to the Pacific Ocean, and eastward to the Atlantic, and through which the great currents of emigration flow between the eastern and western States. Lieutenant Fremont and his party encamped on the summit on the 5th of August, and on the 8th entered among the Wind-River Mountains, on the western side of the Pass, where they spent eight days, and Fremont, with four of his men, ascended to the summit of the loftiest peak, now named Fremont's Peak, which he found by barometer to be 13,750 feet above the sea. The South Pass is about 960 miles, travelling distance, from the junction of the Kansas with the Missouri. The expedition left the Wind-River Mountains on the 18th of August, and recrossing the Pass returned by nearly the same route as that by which they came. They reached the mouth of the Kansas on the 10th of October 1842, having been absent four months.

Lieutenant Fremont was now raised to the rank of brevet-captain of the corps of Topographical Engineers, and was directed by Colonel Abert to connect his survey of 1842 with the surveys of Commander Wilkes on the coast of the Pacific Ocean, so as to give an uninterrupted view of the route from the frontiers of Missouri to the west coast of the American continent. Having engaged 39 men, and made the necessary preparations, Captain Fremont's party reached the little town of Kansas, near the junction of the Kansas with the Missouri, May 17, 1843, whence they started on the 29th of May. The first expedition had been mostly up the Great Platte and the valley of the Sweet-Water. The route of the second expedition was more southern, up the valley of the Kansas to the head waters of the Arkansas, and thence to the South Pass, which was crossed some miles farther south than where it was crossed in 1842. Fremont and his party then proceeded in a south-western direction down the valley of the Green River, on the bank of which they encamped August 15th, 69 miles from the South Pass. They then entered the valley of the Bear River, the principal tributary of the Great Salt Lake, which, on the 6th of September, Captain Fremont beheld from a lofty hill, with feelings of intense delight, it having been for some time the principal object of his search. Having examined the northern end of the lake, he passed through an exceedingly barren region, where the natives exist with great difficulty on roots, insects, and worms. He then entered among the upper tributaries of the Snake River, which is the chief southern branch of the Columbia, or Oregon River, along the valleys of which he descended till he reached Fort Vancouver, not far from the mouth of the Oregon. He left that place in November, and in March 1844 reached the valley of the Rio Sacramento near the junction of the Rio de los Americanos. Travelling thence through Upper California he returned by the Utah Lake, which is the southern end of the Great Salt Lake. From the time when he left the northern end of the lake in September 1843, till he reached the southern end in May 1844 he had completed a circuit of 12 degrees in diameter, north and south, and 10 degrees east and west, and had been occupied eight months in travelling 3500 miles. The expedition afterwards returned by the South Pass, and reached the town of Kansas on the 31st of July 1844, having been travelling fourteen months. From the Great South Pass to the mouth of the Oregon, by the common travelling route, is about 1400 miles.

Captain Fremont's Report of his second expedition had not been published when in the spring of 1845 he started on a third expedition, which was carried out with an energy and perseverance not surpassed by anything on record, and its results well entitled him to the gold Victoria medal of the Royal Geographical Society of Great Britain, which was awarded to him. In this third survey Captain Fremont, having advanced westward to the Pass of the Cascades, where the Columbia traverses the mountains which form the northern extremity of the Sierra Nevada, he boldly explored that chain southward in the depth of winter. With extreme difficulty and after extraordinary

exertions the party at length passed over the last culminating ridge of the Sierra Nevada, and descended into the low country watered by the Rio Sacramento, and in the spring of 1846 arrived at Monterey, then the capital of Upper California. Here, in the previous year, an insurrection had broken out, and Upper California had been declared an independent republic. In 1846 war was declared by the United States against Mexico, and Captain Fremont immediately entered into communication with the American commanders on the coast. In conjunction with Commodore Stockton he retained possession of California, and assumed the military command till General Kearney arrived from New Mexico with his dragoons, and the Americans were enabled, after some hard fighting, to obtain complete possession of the country. Meantime a commission arrived, appointing Fremont a lieutenant-colonel, and as there had been from the first a dispute between Stockton and Kearney as to which of them was entitled to the command in chief, Fremont continued to obey the orders of Stockton. Kearney was dissatisfied, but did nothing in the matter till they both reached Fort Leavenworth on their return home, when he arrested Fremont, and brought him to trial before a court-martial for disobedience of his orders. The court-martial found Lieutenant-Colonel Fremont guilty, and deprived him of his commission. President Polk signed the sentence, but offered Fremont a new commission of the same rank as that of which he had been deprived. This offer Fremont refused, and became thenceforth a private citizen.

Fremont's last and most disastrous expedition occurred at the end of 1848 and beginning of 1849. He had resolved to settle as a farmer in California, and made the necessary arrangements for having his wife and family transferred there by the usual route. He then collected a strong exploring party of about 30 men and 130 mules, with the intention of crossing the Rocky Mountains by the headwaters of the Rio Grande del Norte. He left the Missouri on the 21st of October, reached the Upper Pueblo near the head of the Arkansas, and there unluckily engaged a trapper as a guide who had entirely forgotten the region through which they were to pass, or else had never known it. After much delay and with extreme difficulty they crossed the dividing ridge of the Sierra San Juan, among deep snow, exposed to violent winds, and suffering excessively from intense cold. Fremont then discovered that it was impossible to go forward; he therefore resolved to return, and endeavour to reach New Mexico. They had scarcely recrossed the summit before all the mules were dead, and all the men began to droop, and one or two died. After a series of struggles, exhibiting unconquerable energy and perseverance, Fremont reached Taos in New Mexico, where he obtained relief, and collected those of his party who remained alive. Ten had died, and of those who were living some were so much exhausted as to be unable to walk. He left the Upper Pueblo on the 25th of November 1848, and reached Taos on the 28th of January 1849, so that the party had been for more than two months engaged in this terrible struggle with the elements. From Taos he and his party were transported to Santa Fé, which they reached on the 17th of February. The chief scene of their sufferings was probably about 38° 30' N. lat., 107° W. long. The party reached California without any further difficulty.

California became one of the United States of America in December 1849, and on the 10th of September 1850 Mr. Fremont took his seat in Congress as one of the two senators elected by the State. In the same year, at the suggestion of Humboldt, he received the great gold medal of the Prussian government for "his efforts in the advancement of science," and was elected an honorary member of the Geographical Society of Berlin.

Mr. Fremont, having become a landed proprietor in the state of California, found himself subject to claims for sums due for supplies which had been furnished on his private credit to the American army during the campaign in California. The government of the United States, after much delay, relieved him from these liabilities by paying the sums due. In maintaining his right to the Mariposa estate, which he had purchased, he was in a similar manner subjected to much annoyance by the government, which resisted his claim, and it was not till he had obtained more than one decision in his favour by the Supreme Court of the United States that he obtained a final triumph.

A strong party has now (August 1856) been organised among the Republican Northern States for the election of Fremont as the next President, in opposition to Buchanan, who is supported by the Democratic Southern States. The presidency of Mr. Pierce will terminate on the 3rd of March 1857.

The Reports of Captain Fremont's first two expeditions were published by the American government, and were republished together in England in one volume, entitled 'Narratives of the Exploring Expedition to the Rocky Mountains in the year 1842, and to the Oregon and North California in the years 1843-44, by Brevet-Captain J. C. Fremont, of the Topographical Engineers,' 8vo, London, 1856.

FRERET, NICHOLAS, born at Paris in 1688, was the son of a solicitor. He studied the law to please his family, but devoted his attention chiefly to the study of history and chronology. His first publication, 'Origine des Français et de leur Etablissement dans les Gaules,' is written with a boldness and candour unusual at that time; but it caused his confinement in the Bastille for a short time by order

of the Regent d'Orléans. He was made a member of the Academy of the Inscriptions, and wrote numerous memoirs, chiefly upon difficult questions of ancient history and chronology. His principal works are—'Recherches Historiques sur les anciens Peuples de l'Asie'; 'Observations sur la Généalogie de Pythagore'; 'Observations sur la Cyropédie de Xénophon'; 'Défense de la Chronologie fondée sur les Monuments de l'Histoire ancienne, contre le Système chronologique de Newton.' This last work was edited after Freret's death by Bougainville, who added to it a biographical notice of the author. Freret, while discarding the enormous antiquity attributed by some to Egyptian and Chinese history, and showing the accordance of the authentic records of those nations with the Mosaic chronology, throws back the dawn of the historical times of Greece several centuries further than Newton. He wrote also on the religion and geography of the ancients. Freret was a man of very extensive erudition and of indefatigable application, and he rendered considerable service to history. He died at Paris in 1749. His scattered works have been published together: 'Œuvres complètes de Freret,' 20 vols. 12mo, Paris, 1796. Long after Freret's death, two or three works of an anti-Christian tendency were published under his name by Naigeon, a disciple of Diderot, and others of the same school; but these works are so different in their style and spirit from all those that are known to be his, and their authenticity has been so little proved, that they are now generally regarded as apocryphal.

FRERON, ELIE CATHERINE, was born in 1719, and educated by the Jesuits. He made himself conspicuous by his literary journal, which he began to edit in 1746, under the title of 'Lettres à Madame la Comtesse.' Being suppressed on account of some bitter attacks on several writers, Freron changed its title, in 1749, into that of 'Lettres écrites sur quelques sujets de ce Temps.' In 1764 he again changed the name of his journal to that of 'Année Littéraire,' which he continued till his death in 1774. Freron directed his attacks against the philosophers of the 18th century, and particularly against Voltaire. His bitter invectives were more than retaliated by his adversaries, who succeeded in making Freron's name synonymous with that of a scurrilous reviewer. Freron's son (Louis Stanislas), who continued the 'Année Littéraire' till 1790, became notorious during the French revolution as a violent Jacobin. He died in 1802 at St. Domingo, where he accompanied General Leclerc, being nominated sous-préfet of that island.

FRESCOBALDI, GIROLAMO, a most distinguished composer for and performer on the organ, was a native of Ferrara, and at the age of twenty-three became organist of St. Peter's at Rome. He may be considered as the father of the true organ style, and his writings have been more or less imitated by every orthodox composer of the kind of music in which he so much excelled. "His first work," says Dr. Burney, entitled 'Ricercari e Canzoni Francese, fatte sopra diversi obblighi in Partitura,' contains the first compositions we have seen printed in score, and with bars. They are likewise the first regular fugues that we have found upon one subject, or of two subjects carried on at the same time, from the beginning of a movement to the end." Frescobaldi was born in the early part of the 17th century, but the precise date of neither his birth nor death appears to be known. However, in 1641, according to Della Valle, Frescobaldi was living: Gerber states that his first work was published in 1623.

FRESNEL, AUGUSTIN JEAN, a very distinguished French mathematician and natural philosopher, was born in 1788, at Broglie near Bernay: his father, who was an architect, endeavoured early to communicate to him the rudiments of education; but considerable difficulty was experienced in effecting this desirable object, partly from the delicate state of the pupil's health, and partly, it is supposed, from a distaste in the latter for the acquisition of that kind of knowledge which depends chiefly on the exercise of the memory; hence the youth made small progress in the study of languages, and he was eight years of age before he could write in a legible manner. An inquiring faculty was however manifest in him even at that time by the experiments which he made to determine the best materials and the best constructions for the small machines used in the sports of children.

At the age of sixteen years and a half he was admitted a pupil in the École Polytechnique, where he soon made great progress in the study of the sciences, and where he attracted the notice of Legendre by his solution of a problem which had been proposed by that mathematician as a trial of the abilities of the students. On leaving that institution he was appointed engineer in the department of the Ponts-et-Chaussées.

It is remarkable however that it was not till the year 1814 that Fresnel began to study the branch of science in which he afterwards became so much distinguished. In that year he requested a friend, by letter, to inquire of his uncle what was meant by 'polarisation of light'; and it is to be presumed that he obtained the information he sought, for in eight months from that time he appears to have made himself fully acquainted with the subject. In 1823 he was made a member of the Académie des Sciences at Paris; in 1825 he was elected a Fellow of the Royal Society of London, and two years later this learned body awarded him the Rumford medal for his optical discoveries. At the time of his death, which happened in 1827, he held the post of secretary to the Commission for the Lighthouses of France, and he was succeeded in this post by his brother, M. Léonor Fresnel.

The phenomena of the colours exhibited by crystallised plates when exposed to polarised light, and the rings which appear to surround their axes, were attentively examined by Fresnel, and, in conjunction with his friend Arago, he succeeded in reducing the interferences of polarised light to a few simple laws, which were duly verified by experimental analysis. This subject, which has also been investigated by Sir David Brewster, M. Biot, and subsequently by M. Mitscherlich, is treated by Fresnel in a *Mémoire* which was read to the Institute of France in 1816. He gave a formula for the intensity of a previously polarised ray when reflected from a surface under any angle of incidence in a plane inclined to the plane of primitive polarisation; and this, with a general account of the deviations which the plane of polarisation undergoes in consequence of the reflexion, is contained in two *Mémoires* which were presented to the Académie des Sciences in 1817 and 1818.

In 1819 he gained the prize which in the preceding year had been proposed by the Institute for the best memoir on the diffraction of light. In his *Mémoire* he showed that rays passing at a sensible distance from a reflecting body deviate from their primitive direction and interfere with the direct rays; and, on the principles of the undulatory theory, he ascribed the effect to a number of small waves which originate with each portion of the surface of the primitive wave when it arrives at the reflecting surface. In his '*Mémoire sur la Diffraction de la Lumière*,' 4to, Paris, Fresnel has given a complete explanation, on the undulatory hypothesis, of the coloured fringes produced by an opaque object when exposed to a luminous point: he has also given a table of the several maxima and minima of the intensity of light beyond the limits of the geometrical shadow, and he determined that, within those limits, the light gradually diminishes till total darkness takes place. In order to examine the effects produced by the diffraction of light when it is made to pass through a small aperture, he caused the image of the sun at the focus of a glass lens to fall precisely at the spot where a small circular orifice was made in a plate of metal; and, placing before his eye another glass lens, he suffered the cone of light from the orifice to fall on the lens, when the image of the orifice appeared as a bright spot, surrounded by rings of light of different colours. With a micrometer Fresnel measured the diameters of these rings, and he has given an explanation of the variations produced in the intensity of the light of the central spot when the distance of the eye-glass from the orifice is varied. He observed also the succession of bright and dark bands which are produced when light from a radiant point is reflected from two plane mirrors inclined to one another at an angle nearly equal to 180 degrees.

In a paper entitled '*Considérations théoriques sur la Polarisation de la Lumière*,' which is printed in the '*Bulletin de la Société Philomathique*,' 1824, Fresnel assumes that the eye is affected only by those vibratory motions of the particles of ether which take place transversely, or in planes perpendicular to the direction of the motion of the wave. Unpolarised light he conceived to consist of a rapid succession of waves in which the vibrations are performed in every direction perpendicularly to that of the ray; and common polarised light to consist in the transverse vibrations being parallel to one plane passing through the direction of the ray. By combining the hypothesis of transverse vibrations with the theory of undulations, Fresnel obtained formulæ for the intensity of reflected light at any angle of incidence.

He conceived that the phenomena of double refraction in crystals with one axis depend upon a modification of the actions of the ether by the action of the molecules of the crystal; the elasticity of the latter molecules in a direction perpendicular to the axis being supposed to be different from the elasticity in a direction parallel to the axis. In the year 1821 Fresnel presented to the Académie des Sciences a *Mémoire* in which the properties of double refraction and polarisation in biaxial crystals were contemplated; and he investigated what he called the "surface of elasticity;" a superficies conceived to be such that the force of elasticity by which the vibrations of a molecule in the direction of the radius of such surface are regulated is proportional to the square of that radius. He also gave, for doubly refracting crystals with two axes, an indication of the general equation to a wave surface, which has since been investigated by Ampère and Maccaullagh.

Fresnel's inquiries were also directed to the subject of rotatory polarisation; and he found by experiments that the phenomena might be explained by conceiving the molecules of ether, which give rise to the rays in the direction of the axis of the quarts, or of the fluids in which the like phenomena are exhibited, to revolve uniformly in circles, with different velocities, some from right to left, and others in a contrary direction. The colours produced by such media he conceived to be owing to the interferences of two rays or pencils in which the molecules revolve in opposite directions.

Fresnel also proved that light was circularly polarised by two total reflections from glass at an angle equal to about $54^{\circ} 37'$; and placing a crystallised plate between two rhomboids of glass, each of which polarised the light circularly, and had their planes of reflection at right angles to one another, he observed that the light transmitted through the system exhibited phenomena similar to those which are seen along the axis of quarts. He succeeded in exhibiting before the

Academy, in 1822, a division of the pencils, so that a line appeared double, by making the light pass through prisms of glass which were subject to strong pressure by means of screws; and he was the first who observed the change produced by heat on the tints of sulphate of lime, a subject which has since been more completely investigated by M. Mitscherlich.

Apparently unacquainted with what had been previously proposed by Brewster for a like purpose, this philosopher and engineer devised several constructions of great lenses for lighthouses; one of these constructions consisted of five concentric spheroidal zones (plano-convex) of glass disposed about a central lens, the whole being contained in a square frame. Eight of these, in vertical positions, constituted an octagonal case or lantern, which revolved about a vertical axis, and had in its centre a powerful lamp. Another construction consisted of two great lanterns, as they may be called, one within the other; the convex surface of each was formed of thin cylindrical refractors, and both revolved about a lamp in their common axis: the cylinders were so disposed as to produce, by the revolution, incessant flashes of light.

Fresnel made some experiments for the purpose of decomposing water by means of a magnet; and the method which he pursued consisted in producing a current in an electro-magnetic helix inclosing a bar-magnet covered with silk; on plunging the ends of the wire in water, he obtained some remarkable effects; but, being unable to account for certain anomalies which he observed, he abandoned the project.

(Duleau, *Notice sur Fresnel*; *Biographie Universelle*.)

FRESNOY, DU. [DUFRESNOY.]

FREY, JACOB, one of the most able engravers of the 18th century, was born at Lucern in 1681. After learning the first rudiments of engraving of a cousin in his native place, he went to Rome, where he obtained employment from and was instructed by Westerhout, who also introduced him to the notice of Carlo Maratta, with whom he perfected himself as a draughtsman. Frey made an engraving for Maratta of a drawing of 'Hercules and the Serpent,' after Annibal Caracci, which excited that painter's admiration and astonishment. Frey had used the needle more than was customary at that time with engravers—a practice which Maratta recommended him strongly to pursue.

Frey soon obtained the reputation of the greatest engraver at Rome and of his time. He engraved in all eighty pieces, including many of the finest works of Italian art. Among the principal are—'St. Jerome,' and 'Martyrdom of St. Sebastian,' after Domenichino; 'St. Romualdo,' after Sacchi; a copy of a 'Holy Family,' by Edelinek, after Raffaele; the 'Aurora,' after Guido; and several admirable plates after Maratta, Cignani, Annibal Caracci, and others. The 'Aurora,' after Guido, was one of Frey's favourite pieces; it is beautifully drawn, and the 'Hours' have a surprising degree of buoyancy and motion: though less careful in the detail of the accessories, Frey's is a very superior print to that made by Raffaele Morghen of the same subject, especially in the extremities and general treatment of the 'Hours' and 'Aurora,' which are the essential portion of the composition. He died at Rome in 1752. There is a notice of him and a list of his works in J. C. Fuessli's '*Geschichte der besten Künstler in der Schweiz*;' there is also an account of him in Gandellini's '*Notizie storiche degli Intagliatori*.'

FRISCHLIN, NICODEMUS, born in 1547, was the son of a Protestant clergyman in the duchy of Würtemberg. He showed at an early age a great aptitude for the study of languages, became an accomplished scholar, and was made professor in the University of Tübingen, where he wrote his *Paraphrases* of Virgil's *Bucolics* and *Georgics*, and of Peralus, as well as a great quantity of original poetry, and several dramas, for one of which, entitled 'Rebecca,' he was crowned with a gold laurel crown by the Emperor Rudolf II. at the Diet of Ratisbon, with the title of poet-laureate. But his satirical humour made him enemies, and, being charged with adultery, he was obliged to leave Tübingen. After visiting several towns of Germany, he at last settled at Mayence, where he published some of his works. In consequence, it would seem, of fresh satirical effusions from his pen, the Duke of Würtemberg caused him to be arrested at Mayence, and shut up in a tower, whence he attempted to escape, but fell in so doing from a great height, and died of the fall in November 1590, being forty-three years of age. He wrote a great number of works, the principal of which are:—1, '*De Astronomice Artis cum Doctrinâ Colesti et Naturali Philosophia convenientiâ*;' 2, '*Institutiones Oratoriæ*;' 3, several Orations; 4, a work on education entitled '*De Ratione instituendi Puerum ab anno sextis sexto vel septimo ad annum usque sextumdecimum*;' 5, '*Dialogus Logicus contra P. Rami Sophisticum pro Aristoteli*;' and other treatises against the schoolmen; 6, '*Facetie Selectiores*,' many of them licentious; 7, '*Questionum Grammaticarum, libri octo*;' 8, '*In Tryphiodori Ægyptii Grammatici librum de Iliæ excidio, interpretatio duplex et notæ ad textum Græcum*;' 9, '*Notes on Callimachus*;' 10, '*Aristophanes repurgatus a mendis et interpretatus*;' 11, '*In ebrietatem Carmina*;' and a quantity of verses, elegies, antires, epigrams, besides the dramas and the paraphrases of classic authors above mentioned.

FRISI, PAOLO, a distinguished Italian mathematician, was born at Milan, April 13, 1728, of a family which came originally from Strasbourg; and at fifteen years of age he was placed in a monastery

of the Barnabites, of whose order he became a member. At this time apparently the cultivation of the sciences formed no part of the discipline of the institution; Frisi acquired however some notion of geography from a number of old maps which lined the walls of the corridors, and he made considerable progress in the study of mathematics, with almost no other aid than that of a few books of which he obtained possession.

From Milan he was sent to the University of Pavia, where he studied theology; and at intervals of leisure he greatly extended his knowledge of mathematics. He was afterwards appointed to give instruction in philosophy at Lodi; and while at this place he composed a treatise entitled '*Disquisitio Mathematica in Causam Physicam Figure et Magnitudinis Telluris nostræ*,' which his friend Donato Silva, at his own expense, caused to be published at Milan in 1751. In this work proof is given, agreeably to the Newtonian system, that the earth has the form of an oblate spheroid; and its merit procured for the author an invitation from the king of Sardinia to deliver lectures in philosophy at Casal. Frisi accepted the invitation; but the Académie des Sciences of Paris having in 1753 nominated him one of its foreign correspondents, the honour thus conferred upon him seems to have induced the principals of his order at Milan to give him the appointment of professor of philosophy in the college of St. Alexander in that city. His dissertation on the figure of the earth was about that time criticised by an ill-informed person, a Jesuit, who asserted that the arguments were inconclusive, and who reproached the author with attempting to obscure the glory of Italian science by the adoption of English ideas. Such an adversary was easily silenced, but the attack produced in the mind of Frisi a rooted dislike to the Jesuits in general. In answer to the objections made to some of the propositions he wrote a work called '*Estratto del Capo Quarto del Quinto Volume della Storia Letteraria d'Italia*,' &c., which was published at Milan in 1755.

In the same year he published at Lugano a tract entitled '*Saggio della Morale Filosofia*,' &c.; and, at Milan, his work '*De Existentiâ et Motu Ætheris, seu de Theoria Electricitatis*,' &c. About the same time he took occasion to oppose in public the belief in witchcraft and magic, which then existed in Italy; and this boldness, together with a certain freedom in his manner of living, appears to have raised up against him many enemies: fearing their machinations, he wished to withdraw from Milan, and he gladly accepted an appointment in the University of Pisa, which was conferred upon him in 1756 by the grand-duke Leopold. While holding this post he published, in Latin (Luca, 1757), select dissertations on the subject of electricity, which two years before had been written by Euler, Resaud, and himself, for the prize proposed by the Academy of Sciences at St. Petersburg; and a tract entitled '*De Motu Diurno Terræ*' (Pisa, 1758), which had obtained the prize proposed by the Royal Academy of Berlin. He also published '*Dissertationes Varie*' in two volumes; of which the first (Luca, 1760) contains a tract entitled '*De Atmosphærâ Cœlestium Corporum*,' and the second (Luca, 1761) two others, entitled '*De Inæqualitibus Motus Planetarum omnium in Orbitis Circularibus atque Ellipticis*' (in two books), and '*De Methodo Fluxionum Geometricarum*.'

In 1760 Frisi made a journey to Rome and Naples in consequence of a commission which he received from the pope, Clement XIII., to examine and report upon a subject in dispute between the people of Ferrara and Bologna respecting the navigation of certain rivers: he also assisted with his advice the commissioners appointed by the Venetians to repair the damages caused by the overflowing of the Brenta; and for these services, though he appears to have excited the jealousy of the engineers of the country, and to have made enemies of many persons whose estates were affected by the measures which were taken in consequence of his reports, he was liberally remunerated both by the pope and the Venetians. In 1761 he published, at Luca, a tract entitled '*Piano de' Lavori da farsi per liberare e assicurare dalle Acque le Provincie di Bologna, di Ferrara, di Ravenna*,' &c.; and, in the following year, one in three books, entitled '*Del Modo di regolare i Fiumi e Torrenti principalmente del Bolognese e della Romagna*.' Of this there have been four editions. He returned to Milan in 1764, having been appointed professor of mathematics in that city, and, except occasional absences, he continued to reside there till his death. In the year 1766 he made a visit to France, and thence he came to London, where, as well as in Paris, he received great attentions from the learned: the Portuguese ambassador in the latter city proposed to him an appointment in Lisbon, but this he declined, being unwilling entirely to leave his country. Two years afterwards he went to Vienna, where also he was well received, and where he was consulted on the subject of the disputes between the pope and the emperor.

Soon after his return, the pope (Pius VI.) gave him a dispensation from his monastic engagements, and he lived subsequently as a secular priest. In 1778 he made a journey to Switzerland, where he conceived the idea of writing a tract on subterranean rivers; and this, with dissertations on the meteorological influence of the moon, on conductors of electricity, and on the heat of the earth, he published at Milan, in 1781, under the title of '*Opuscoli Filosofici*.'

In the year 1776, having previously enjoyed excellent health, he first felt the symptoms of a painful disease; these gradually increased in violence, and eight years afterwards, in the hope of obtaining relief, he underwent an operation: a mortification however ensued, and

terminated his life at Milan, November 22, 1784, in his sixty-seventh year. He was buried in the church of St. Alexander in that city, and the Barnabites honoured his tomb with an epitaph in Latin.

In 1757 Frisi was elected a Fellow of the Royal Society of London: he was also a member of the Academy of Sciences of St. Petersburg, of the Academies of Berlin, Stockholm, Copenhagen, and Berne, and of the Institute of Bologna. He received a golden medal in 1759 from the archduke Joseph, afterwards emperor; and the empress Maria Theresa granted him a pension for life.

Besides the works which have been mentioned Frisi published many others; and of these the following are the principal:—'*Prelæctio habita Mediolani*,' viii. idus Maii, (1764); '*Saggio sopra l'Architettura Gotica*' (Leghorn, 1766); '*De Gravitate Universali libri tres*' (Milan, 1768), a work much praised by D'Alembert and John Bernoulli; '*Della Maniera di preservare gli Edifizj dal Fulmine*' (Milan, 1768); '*Danielis Melandri et Pauli Frisii alterius ad alterum de Theoria Lunæ Commentarii*' (Parma, 1769); '*Cosmographiæ Physicæ et Mathematicæ*,' 2 tom. 4to. (Milan, 1774, 1775)—this is considered his principal work; '*Del' Architettura, Statica, e Idraulica*' (Milan, 1777) '*Pauli Frisii Operum*,' tom. 1, *Algebræ et Geometriæ Analyticæ continens* (Milan, 1782); tom. 2, *Mechanicam Universam et Mechanicæ Applicationem ad Aquarum Fluentium Theoriam* (ibid, 1783). The third volume, which treats of Cosmography, was published by two of his brothers after his death. He published, at various times, notices of the lives of Galileo Galilei and Bonaventura Cavalieri, of Sir Isaac Newton, Donato Silva, and Titus Pomponius Atticus: he wrote a notice of the empress Maria Theresa, which was published at Pisa in 1783, without his name; and one of D'Alembert, which was published after his death. He also left several works in manuscript.

* FRITH, WILLIAM POWELL, R.A., a native of Yorkshire, was born in 1819. Having shown a decided predilection for art, he was about 1835 placed in Sass's school, Charlotte-street, Bloomsbury, and thence proceeded to the schools of the Royal Academy. After a trial with an unimportant picture at the British Institution in 1839, he the following year sent to the exhibition of the Royal Academy a very promising painting of '*Malvolio before the Countess Olivia*.' In succeeding years he contributed pictures of the same order from Shakspeare, Scott, Sterne, Goldsmith, and Molière, making his way steadily as a clever and careful artist, remarkable however more for skill and taste in execution than for originality of conception or intellectual power. In 1844 he made indeed a somewhat more ambitious effort than he had previously essayed, in an '*Interview between John Knox and Mary Queen of Scots, respecting her Marriage with Darnley*;' but it was not very successful, and he returned to his more homely range of subjects in the '*Village Pastor*,' from Goldsmith, which appeared at the exhibition of the Royal Academy in 1845, and obtained his election as an associate of that institution. The next year he furnished one of his best pictures, '*Madame Jourdain discovering her Husband at the Dinner which he gave to the Belle Marquise and the Count Dorante*,' in which Mr. Frith has perhaps made as near an approach to humour as in any picture he has yet painted. The next year however, stimulated by his newly-acquired honours, he put forth his powers in a larger and more elaborate work, '*An English Merry-Making a Hundred Years ago*,' which attracted general attention, and, though it was a year of great pictures, Mr. Frith's not only kept its place, but proved indeed one of the most popular pictures of the year. The next season saw from his pencil three pictures of a somewhat different character—'*An Old Woman, accused of having Bewitched a Peasant, brought before a Country Justice*,' in which the mingling of mirth and sentiment was not very happy; '*A Stage-Coach Adventure in 1750*;' and a '*Scene from the Bourgeois Gentilhomme*.' In 1849 appeared his '*Coming of Age*,' so well known from Mr. Holl's engraving. It is only necessary to mention the most marked of his subsequent pictures. In the exhibition of 1851 he had a very clever work, '*Hogarth brought before the Governor of Calais as a Spy*.' '*Pope making love to Lady Mary Wortley Montague*' (1852), though a pretentious was an unpleasant rendering of a subject essentially unadapted for anything better than a coarse wood-cut. A far better picture was '*Life at the Sea-Side*' (1853), a view of Ramsgate beach in the height of the 'season,' depicted with much quaint grace and some humour—like a sketch of Leech's worked up into a well-painted picture. This picture caught the general fancy more perhaps than any other of Mr. Frith's works, and had the honour of being purchased by her Majesty: an engraving from it is now in course of execution by Mr. Sharpe. '*Maria tricks Malvolio*,' was the title of his principal contribution in 1855; and '*Many happy Returns of the Day*,' that in 1856. Mr. Frith was elected R.A. in 1853.

Mr. Frith is of the whole one of the most equal of our established painters. His failures are chiefly such as arise from mischoice of subject; the technical part is always carefully executed, and seldom exhibits any very palpable mistake or shortcoming. But if there is never any great failure there is never any distinguished success. His pictures are literally level to every capacity. His ladies are always plump and pretty and well-dressed. Whatever their part, they carry all the dainty drawing-room graces and proprieties into it. They are evidently playing their part with a full consciousness that they are being looked at and admired while playing it. The men are equally plump, smooth-faced, and well-dressed, and even more artificial. The

children, alike in their looks and clothes and behaviour, are all that an affectionate mamma could wish her darlings to be. Mr. Frith's pictures consequently are the delight of the ladies, and find special favour with well-conditioned citizens. His technical merits are just such as confirm and secure the kind of admiration which the range of his subjects and the character of his personages excite. His colour is always bright and fresh and gay. His drawing is good, without parade or affectation. His touch is light and neat, yet sufficiently varied; and he finishes every part with scrupulous care.

FROBEN, or FROBENIUS, JOHN, was a native of Hammelburg in Franconia, where he received his earliest education. He afterwards went to the university of Basel, and there acquired the reputation of being an eminent scholar. With the view of promoting useful learning, he applied himself to the art of printing; and becoming master of it, opened a shop in Basel, probably about 1491. He was the first of the German printers who brought the art to perfection; and one of the first who introduced into Germany the use of the Roman character. Being a man of probity and piety as well as skill, he would never suffer libels, or anything that might hurt the reputation of another, to go through his press for the sake of profit. Froben's great reputation was the principal motive which led Erasmus to fix his residence at Basel, in order to have his own books printed by him. The connection between them grew close and intimate, and was one of the sincerest cordiality. Erasmus loved the good qualities of Froben, as much as Froben admired the great ones of Erasmus.

There is an epistle of Erasmus extant, which contains so full an account of this printer, that it forms a very curious memoir for his life. It was written in 1527, on the occasion of Froben's death, which happened that year; and which, Erasmus tells us, he bore so extremely ill, that he really began to be ashamed of his grief, since what he felt upon the death of his own brother was not to be compared to it. He says, that he lamented the loss of Froben, not so much because he had a strong affection for him, but because he seemed raised up by Providence for the promoting of liberal studies. Then he proceeds to describe his good qualities, which were indeed very great and numerous; and concludes with a particular account of his death, which was somewhat remarkable. Erasmus wrote his epitaph in Greek and Latin. Both these epitaphs are at the end of his epistle.

A large number of valuable authors were printed by Froben, with great care and accuracy; among which may be enumerated, the works of St. Jerome, 5 vols. folio, 1516, reprinted in 1520 and 1524; those of St. Cyprian, fol. 1521; Tertullian, fol. 1521, reprinted in 1525; the works of Hilary, bishop of Poitiers, fol. 1523, reprinted in 1526; St. Ambrose, 4 vols. folio, 1527. All of these were edited by Erasmus. Froben formed a design to print the Greek Fathers, which had not then been done; but death prevented him. That work however was carried on by his son Jerome Frobenius, and his son-in-law Nicholas Bleschhof, or Episcopopus, who, joining in partnership, carried on the business with the same reputation, and gave very correct editions of those fathers.

FROBISHER, SIR MARTIN, an enterprising English navigator, who, as Stow informs us, was born at Doncaster, in Yorkshire, of parents in humble life, but it is not known in what year. Being brought up to the sea, he very early displayed the talents of a great navigator, and was the first Englishman who attempted to find out a north-west passage to China. He made offers for this purpose to different English merchants for fifteen years, without effect; but being at last patronised by Ambrose Dudley, earl of Warwick, and other persons of rank and fortune, he engaged a sufficient number of adventurers, and collected such sums of money as enabled him to fit himself out for his voyage. He provided only three ships, two barks of about twenty-five tons each, called the Gabriel and the Michael, and a pinnace of ten tons. With these he sailed from Deptford, June 8th 1576; and the court being then at Greenwich, the queen beheld them as they passed by, "commended them, and bade them farewell, with shaking her hand at them out of the window." Bending their course northward, they came on the 24th within sight of Fara, one of the islands of Shetland; and on the 11th of July discovered Freeland, bearing W. N. W., which stood high, and was covered with snow. They could not land by reason of the ice, and great depth of water near the shore. The east point of this island Captain Frobisher named "Queen Elizabeth's Foreland." On the 28th they had sight of Meta Incognita, being part of New Greenland, on which also they could not land, for the reasons just mentioned. August 10th Frobisher went on a desert island, three miles from the continent, but staid there only a few hours. The next day he entered into a strait which he called Frobisher's Strait, a name which it still retains. On the 12th, sailing to Gabriel's island, they came to a sound, which they named Prior's Sound, and anchored in a sandy bay there. On the 15th they sailed to Prior's Bay; on the 17th to Thomas William's island, and on the 18th came to anchor under Burcher's island. Here they went on shore, and had some communication with the natives, by whose treachery they lost a boat and five of their men. Frobisher having endeavoured in vain to recover his men, set sail again for England on the 26th of August; came again within sight of Freeland on the 1st of September; and notwithstanding a terrible storm

on the 7th of the same month, he arrived at Harwich on the 2nd of October.

Frobisher took possession of the country he had landed upon in Queen Elizabeth's name, and, in token of such possession, ordered his men to bring to him whatever they could first find. One among the rest brought a piece of black stone, in appearance like sea-coal, but very heavy. Having at his return distributed fragments of it among his friends, the wife of one of the adventurers threw a fragment into the fire, which being taken out again and quenched in vinegar, glittered like gold; and being tried by some refiners in London, was found to contain a portion of that rich metal. This circumstance raising prodigious expectations of gold, great numbers of persons earnestly pressed and soon fitted out Captain Frobisher for a second voyage, to be undertaken in the following spring. The queen lent him a ship of the royal navy of 200 tons, with which, and two small barks of about 80 tons each, he fell down to Gravesend, May 26th 1577, where the minister of the parish came aboard the greater ship, the Aid, and administered the sacrament to the company. Two days after they reached Harwich, whence they sailed on the 31st of May.

The whole complement of gentlemen, soldiers, sailors, merchants, miners, &c., who accompanied the expedition, was 140, furnished with victuals and all other necessaries for seven months. They arrived in St. Magnus Sound, at the Orkney islands, upon the 7th of June, whence they kept their course for the space of twenty-six days without seeing land. They met however with great drifts of wood, and whole bodies of trees, which they imagined to come from the coast of Newfoundland. On the 4th of July they discovered Freeland, along the coasts of which they found vast islands of ice, some being seventy or eighty fathoms under water, and more than half a mile in circuit. Not having been able safely to land in this place, they proceeded to Frobisher's Strait; and on the 17th of the same month made the north foreland in it, otherwise called Hall's Island, as also a smaller island of the same name, where they had in their previous voyage found the ore, but could not now get a piece as large as a walnut. They met with some of it however in adjacent islands. On the 19th they went upon Hall's greater island to discover the country, and the nature of the inhabitants, with some of whom they trafficked, and took one of them, neither in a very just nor handsome manner; and upon a hill here they erected a column of stones, which they called Mount Warwick. They now sailed about, to make what discoveries they could, and gave names to different bays and islands; as Jackman's Sound, Smith's Island, Bear's Sound, Leicester's Isle, York's Sound, Ann countess of Warwick's Sound and Island, &c.

Frobisher's instructions for this voyage were principally to search for ore in this neighbourhood; he was directed to leave the further discovery of the north-west passage till another time. Having therefore in the Countess of Warwick's Island found a good quantity, he took a lading of it. He set sail the 28th of August, and arrived in England about the end of September. He was most graciously received by the queen, and her majesty appointed commissioners to make trial of the ore, and examine thoroughly into the probability of a north-west passage to China. The commissioners did so, and reported the great value of the undertaking, and the expediency of farther carrying on the discovery of the north-west passage. Upon this, suitable preparations were made with all possible despatch; and because the mines newly found out were sufficient to defray the adventurers' charges, it was thought necessary to send a select number of soldiers to secure the places already discovered, to make farther discoveries into the inland parts, and to search again for the passage to China. Besides three ships, as before, twelve others were fitted out for this voyage, which were to return at the end of the following summer with a lading of gold-ore. They assembled at Harwich on the 27th of May 1578, and sailing thence on the 31st, they came within sight of Freeland on the 20th of June, when Frobisher, who was now called lieutenant-general, took possession of the country in the queen of England's name, and called it West England, giving the name of Charing Cross to one of the high cliffs. On July 4th they came within the mouth of Frobisher's Strait, but being obstructed by the ice, which sank one of their barks, and driven out to sea by a storm, they were so unfortunate as not to hit the entrance of it again. Instead of which, being deceived by a current from the north-east, and remaining twenty days in a continual fog, they ran sixty leagues into other unknown straits before they discovered their mistake. Frobisher however, coming back again, made for the strait which bore his name; and on the 23rd of July, at a place within it called Hatton's Headland, found seven ships of his fleet. On the 31st of the same month he recovered his long-desired port, and came to anchor in the Countess of Warwick's Sound; but the season of the year being too advanced to undertake discoveries, after getting as much ore as he could, he sailed with his fleet for England, where, after a stormy and dangerous voyage, he arrived in the beginning of October.

We have no account how Frobisher employed himself from this time to 1585, when he commanded the Aid, in Sir Francis Drake's expedition to the West Indies. In 1588 he commanded the Triumph, and exerted himself very bravely against the Spanish Armada on July the 26th, in which year he received the honour of knighthood, on board his own ship, from the lord high admiral, for his valour. In 1590 he commanded one of two squadrons upon the Spanish coast.

In 1594 he was sent with four men-of-war to the assistance of Henry IV. of France, against a body of the leaguers and Spaniards, then in possession of part of Brittany, who had fortified themselves very strongly at Croyzon, near Brest. Here in an assault upon that fort, on November 7th, he was wounded by a ball in the hip, of which he died soon after he had brought the fleet safely back to Plymouth, and was buried in that town. (Hakluyt's 'Collection of Voyages,' vol. iii., pp. 29, 32, 39; Stow's 'Annales,' edit. 1631, p. 109; 'Biogr. Brit.,' vol. iii., p. 2044.) There is a good portrait of Sir Martin Frobisher in the picture-gallery at Oxford; and many of his letters and papers, with others relating to him, are preserved in the Cottonian and Harleian collections of manuscripts in the British Museum. The instructions given to him for the voyage of 1577 are printed in the 'Archæologia,' vol. xviii., p. 287, from one of Sir Hans Sloane's manuscripts. His last letter, reporting the taking of the fort of Croyzon, dated November 8th 1594, is preserved in the Cottonian Manuscript, Calig. E. ix. fol. 211. A Latin translation of the account of his voyage of 1577, under the title of 'Historia Navigationis Martini Forbissieri,' by Joh. Tho. Freigius, was published at Hamburg in 4to, 1675.

FROISSART, JEAN, was born at Valenciennes about 1337. He was the son, as is conjectured from a passage in his poems, of Thomas Froissart, a herald-painter, no inconsiderable profession in the days of chivalry. The youth of Froissart, from twelve years upwards, as he himself informs us, was spent in every species of elegant indulgence. In the midst of his dissipation however, he early discovered the ardent and inquisitive spirit to which we owe so much; and even at the age of twenty, at the command of his "dear lord and master, Sir Robert of Namur, lord of Beaufort," he began to write the history of the French wars. The period from 1326 to 1356 was chiefly filled up from the chronicles of Jean le Bel, canon of Liège, a confidant of John of Hainault, and celebrated by Froissart for his diligence and accuracy. It is reasonable to believe that this work was interrupted during a journey to England in the train of Philippa of Hainault, the heroic wife of Edward III., and mother of the Black Prince. Froissart was for three or four years secretary, or clerk of her chamber, a situation which he would probably have retained but for a deep-rooted passion for a lady of Flanders, which induced him to return to that country; a circumstance equally favourable to the history of the Continent, and unfortunate for that of Britain. During his residence in England he visited the Scottish mountains, which he traversed on a palfrey, carrying his own portmanteau, and attended only by a greyhound. His character of historian and poet introduced him to the court of David II., and to the hardly less honourable distinction of fifteen days abode at the castle of Dalkeith with William, earl of Douglas, where he learned personally to know the race of heroes whose deeds he has repeatedly celebrated.

Froissart was in France at Melun-sur-Seine in April 1366; perhaps private reasons might have induced him to take that road to Bordeaux, where he was on All Saints' day of that year, when the Princess of Wales was brought to bed of a son, who was afterwards Richard II. The Prince of Wales setting out a few days afterwards for the war in Spain against Henry the Bastard, Froissart accompanied him to Dax, where the prince resided some time. He had expected to attend him during the continuance of this great expedition, but the prince would not permit him to go farther; and shortly after his arrival sent him back to the queen his mother. Froissart could not have made any long stay in England, since in the following year, 1368, he was at different Italian courts. It was this same year that Lionel, duke of Clarence, son of the king of England, espoused Joland, daughter of Galeas II., duke of Milan. Froissart, who probably was in his suite, was present at the magnificent reception which Amadeus, count of Savoy, surnamed the Count Vert, gave him on his return: he describes the feasts on this occasion, and does not forget to tell us that they danced a virelay of his composition. From the court of Savoy he returned to Milan, where the same Count Amadeus gave him a good *colardie*, a sort of coat, with twenty florins of gold; thence he went to Bologna and Ferrara, where he received forty ducats from the King of Cyprus, and thence to Rome. Instead of the modest equipage he travelled with into Scotland, he was now like a man of importance, travelling on a handsome horse, attended by a hackney. It was about this time that Froissart experienced a loss which nothing could recompense—the death of Queen Philippa, which took place in 1369. He composed a lay on this melancholy event, of which however he was not a witness; for he says, in another place, that in 1395 it was twenty-seven years since he had seen England. According to Vossius and Bullart, he wrote the life of Queen Philippa; but this assertion is not founded on any proofs.

Independently of the employment of clerk of the chamber to the Queen of England, which Froissart had held, he had been also of the household of Edward III., and even of that of John, king of France. Having however lost his patroness, he did not return to England, but went into his own country, where he obtained the living of Lestines. Of all that he performed during the time he exercised this ministry, he tells us nothing more than that the tavern-keepers of Lestines had 500 francs of his money in the short space of time he was their rector. It is mentioned in a manuscript journal of the Bishop of Chartres, chancellor to the Duke of Anjou, that, according to letters sealed December 12, 1381, this prince caused to be seized fifty-six

quires of the 'Chronicle' of Froissart, rector of the parish of Lestines, which the historian had sent to be illuminated, and then to be forwarded to the King of England, the enemy of France. Froissart attached himself afterwards to Wenceslaus of Luxembourg, duke of Brabant, perhaps in quality of secretary. This prince, who had a taste for poetry, commissioned Froissart to make a collection of his songs, rondeaus, and virelays; and Froissart, adding some of his own pieces to those of the prince, formed a sort of romance, under the title of 'Meliador; or, the Knight of the Sun;' but the duke did not live to see the completion of the work, for he died in 1384.

Immediately after this event, Froissart found another patron in Guy count de Blois, who made him clerk of his chapel, for which Froissart testified his gratitude by a pastoral and epithalamium on a marriage in the family. He passed the years 1385, 1386, and 1387 sometimes in the Blaisois, sometimes in Touraine; but the Count de Blois having engaged him to continue his history, which he had left unfinished, he determined in 1388 to take advantage of the peace which was just concluded to visit the court of Gaston Phœbus count de Foix, in order to gain full information of whatever related to foreign countries and the more distant provinces of the kingdom. His journey to Ortez, the chief residence of the Count de Foix, in company with Sir Espaing du Lyon, is one of the most interesting parts of Froissart's 'Chronicle.' The Count de Foix received and admitted him as a member of his household. Here Froissart used to entertain Gaston after supper by reading to him the romance of 'Meliador,' which he had brought with him. After a long sojourn at the court of Ortez he returned to Flanders by the route of Avignon. We learn from a poem referred to by M. de St. Palaye, that on this occasion the historian, always in quest of adventures, met a personal one with which he could have dispensed, being robbed of all the ready money which his travels had left him. After a series of journeys into different countries for the sake of obtaining information, we find him in 1390 in his own country, solely occupied in the completion of his history, until 1393, when he was again at Paris. About 1378 he obtained from Pope Clement VII. the reversion of a canonry at Lille, and in the collection of his poetry, which was completed in 1393, and elsewhere, he calls himself canon of Lille; but Pope Clement dying in 1394, he gave up his expectations of the reversion, and began to qualify himself as canon and treasurer of the collegiate church of Chimay, which he probably owed to the friendship of the Count de Blois.

In 1395 Froissart revisited England, where he was received with marks of high favour and affection by Richard II. and the royal family. Here he went on collecting for his history, and had the honour to present his 'Meliador' to the king, who was much delighted with it, "for he could speak and read French very well." After a residence of three months Froissart left England, and at his departure received from the king a silver goblet containing a hundred nobles. He finally settled at his benefice of Chimay, and employed as usual the hours of his leisure in arranging and detailing the information collected in his travels. The melancholy fate of his benefactor, Richard II., in 1399, became the subject of his latest labours. It is uncertain how long Froissart survived the death of Richard and the conclusion of his 'Chronicle;' he was then about sixty years old, and died shortly after at Chimay, according to an entry in the obituary of the chapter.

The period of history embraced in Froissart's 'Chronicle' is from 1326 to 1400. The best of the old editions of the original is that of Lyon, in 4 vols. folio, 1559. One of the most valuable of the recent editions is that in the 'Collection des Chroniques Nationales Françaises, avec Notes et Eclaircissements, par J. A. Buchon,' in 15 vols. 8vo, Paris, 1824-26. Froissart's 'Chronicle' seems to have been first printed at Paris by Ant. Verard, without date, 4 vols. folio, and was reprinted by Guill. Eustace, Paris, 1514. There are two English translations; one by Bouchier lord Berners, made 'at the high commandment' of king Henry VIII., fol., Lond., Pinson, 1525-26; reprinted in 2 vols. 4to, Lond., 1812, under the editorial care of E. V. Uttersen, Esq.; the other, 'with additions from many celebrated MSS.,' translated by Thomas Johnes, Esq., appeared 'from the Hafod press,' in 4 vols. 4to, 1803-5.

The principal particulars of Froissart's life have been here condensed from that by St. Palaye, translated and edited by Mr. Johnes, 8vo, Lond., 1801, and revised and republished in 4to, Hafod, 1810.

There are several splendidly illuminated manuscripts of Froissart's 'Chronicle,' quite or nearly contemporary, preserved in the British Museum: one a complete copy, belonging to the old royal library of the kings of England, 14 D. ii. vi.; another consisting of the second and fourth books in the same collection, 18 E. i. and ii.; a third in the Harleian Library, MSS. 4379 and 4380, containing the fourth book only; a fourth, an imperfect copy, is in the Arundel collection, No. 97.

FRONTINUS, SEXTUS JULIUS, born of a patrician family, was prætor of Rome A.D. 70, and about five years later was sent by Vespasian to Britain, where he seems to have remained three years, during which he conquered the Silures. (Tacitus, 'Agricola,' 17.) About A.D. 78 he was succeeded by Agricola in the command of the troops in Britain. On his return to Rome he wrote, under the reign of Domitian, his work, 'Strategemata,' in four books, in which he gives short anecdotes of numerous Greek and Roman generals, illustrative of the practice and resources of war. Nerva entrusted him with the

superintendence of the supply of water to Rome, and while filling this office, which he retained under Trajan, he wrote his work on the aqueducts, which has been printed in the earlier editions under the title of 'De Aquis que in Urbem influunt,' but is now generally known by the title 'De Aqueductibus.' It contains much valuable information on the mode in which ancient Rome was supplied with water, and on everything that concerned this important part of the economy of that city. Frontinus died under Trajan, about A.D. 106. Several other works have been attributed to him, such as 'De Colonia,' 'De Limitibus,' 'De Qualitate Agrorum,' but seemingly without foundation. See the Bipontine edition of his works, with a life of Frontinus, 8vo, 1788. 'The Stratagems, Sleights, and Policies of Warre,' of Frontinus were translated into English by Richard Morysine, and published in London in 1639, and another version appeared in 1686, and it has been translated into German, Italian, French, Spanish, &c. His work 'De Aqueductibus' was translated into French, and illustrated by engravings, 4to, Paris, 1830.

FRONTO, MARCUS CORNELIUS, born at Cirta, in Africa, of an Italian family, after studying in his own country came to Rome in the reign of Hadrian, and acquired great reputation as a rhetorician and grammarian. Antoninus Pius appointed him preceptor to his two adopted sons, Marcus Aurelius and Lucius Verus, whose confidence and affection he gained. After being consul, Fronto was appointed to a government in Asia, which his bad health prevented him from filling. His learning and his instructive conversation are mentioned with praise by Aulus Gellius, the historian Appian, and others of his contemporaries. He died in the reign of Marcus Aurelius, at an advanced age. Until of late years we had nothing of his works, except fragments of his treatise 'De Differentiâ Verborum,' being a vocabulary of the so-called synonyms; but in 1815 Angelo Mai, having discovered in the Ambrosian Library at Milan a palimpsest manuscript on which had been originally written some letters of Fronto to his two pupils, deciphered the text wherever the writing was not entirely obliterated, and published it with notes. It happened by singular good fortune that Mai, being some years after appointed librarian of the Vatican, discovered in another palimpsest volume another part of Fronto's letters, with the answers of Marcus Aurelius and Verus. Both the volumes came originally from the convent of St. Columbanus, at Bobbio, the monks having written them over with the Acts of the first council of Chalcedon. It happened that one of the volumes was transferred to Milan, and the other to Rome. Mai published the whole in a new edition: 'M. Cornelii Frontonis et M. Aurelii imperatoris epistulae: L. Veri et Antonini Pii et Appiani epistularum reliquiae: Fragmenta Frontonis et scripta grammatica,' 8vo, Rome, 1823. These letters are very valuable, as throwing additional light on the age of the Antonines, confirming what we know of the excellent character of Marcus Aurelius, and also showing his colleague Verus in a more favourable light than he had been viewed in before. The affectionate manner in which both emperors continue to address their former preceptor is very touching. Two or three short epistles of Antoninus Pius are also interesting. There are besides many letters of Fronto to various friends, a few of which are in Greek. The work was translated into French, and published with the text and notes, 2 vols. 8vo, Paris, 1830.

* FROST, WILLIAM EDWARD, A.R.A., was born at Wandsworth, Surrey, in September 1810. His artistic training, like that of a large number of our eminent painters, was commenced (about 1825) at Sasse's academy in Bloomsbury, and completed at the Royal Academy, where he entered as a student in 1829. As a student he distinguished himself both by diligence and success: in each of the schools of the Royal Academy, except that of the antique, where Maclise was the successful competitor, he won the first prize; and he completed his course as a scholar by carrying off the gold medal in 1839 by his picture of 'Prometheus bound by Force and Strength.' While attending the academy, and until his original pictures secured him patrons, Mr. Frost painted portraits, which no doubt served, besides their temporary purpose, to train his eye to observation of character and individual expression.

Mr. Frost first attracted notice by a cartoon of 'Una alarmed by the Fauns and Satyrs,' which he sent to the cartoon competition of 1843 at Westminster Hall, where it obtained one of the premiums of 100*l*. His gold-medal picture had been exhibited at the Royal Academy in 1840, but his name does not occur again in the catalogue till 1843, when a painting by him of 'Christ crowned with Thorns' appeared, and with his cartoon attracted so much notice, that Mr. Frost at once resolved to abandon portrait-painting. When Mr. Frost first thought of adopting painting as a profession he had been introduced to Mr. Etty, who kindly assisted him in his early studies, and continued subsequently to favour him with valuable advice. Whether this may have had anything to do with the direction of the young artist's efforts we know not, but eventually it was to the same line of subjects as that by which Etty had acquired so much fame that Mr. Frost devoted himself. His first important works of this class were a 'Bacchanalian Dance' exhibited at the British Institution in 1844, and 'Nymphs Dancing,' exhibited the same year at the Royal Academy. They were quickly sold, and brought substantial commissions. In 1845 followed 'Sabrina,' in 1846 'Dianna surprised by Acton,' which won for itself a place in Lord Northwick's fine collection and for the painter the

dignity of A.R.A. The following year Mr. Frost contributed to the Academy exhibition a still more ambitious work, 'Una and the Wood-Nymphs,' which was purchased by the Queen, who as well as Prince Albert has since continued to patronise the painter. His subsequent pictures are—'Euphrosyne,' 1848; the 'Sirens,' 1849; the 'Dissuading of Cupid,' painted for Prince Albert, and 'Andromeda,' 1850; 'Wood-Nymphs' and 'Hylas,' 1851; 'Nymph and Cupid' and 'May Morning,' 1852; 'Chastity,' 1854; 'Bacchante and Young Fawn Dancing,' 1855; and the 'Graces,' 1856, besides various smaller pieces.

Although Mr. Frost has followed Etty in his style of subjects, and perhaps caught something from him in composition and colour, nothing can be less like the dash and daring, or the joyous abandon of Etty, than the chastely correct, and almost coldly academic, undraped nymphs of Frost's painting. His works are, from the nature of their subjects, necessarily conventional; and they appeal essentially to a highly-artificial, perhaps we ought to say highly-cultivated, taste. They find however, as they abundantly deserve, warm admirers in the class to which they are addressed. Their technical merits are very high. The drawing is excellent, the colour sufficiently pleasing, and the execution sometimes almost miniature-like in its elaborate finish; while, if deficient in free living spontaneity and unconsciousness, they always display great refinement and almost courtly grace.

FRY, MRS. ELIZABETH, was the third daughter of John Gurney, Esq., of Earham Hall, near Norwich, an opulent merchant and banker, and a member of the Society of Friends. Elizabeth Gurney was born May 21, 1780, at Bramerton, four miles from Norwich, where her parents had then a summer residence; in winter they occupied a large and commodious house in Norwich. They were not 'plain Friends,' that is, they did not wear the plain dress of the Quakers, nor use 'thou' and 'thee' in place of the ordinary 'you,' nor abstain from the usual amusements of social life. They of course attended the Friends' meeting-house at Norwich, and the monthly and quarterly and yearly meetings; but in other respects there was little distinction between them and the gentry who belonged to the Church of England. Mrs. Gurney died when Elizabeth was only twelve years of age, leaving seven daughters and four sons. Mr. Gurney's business-pursuits led him into intercourse with persons of all denominations; and a warm heart, social disposition, and courteous manners, introduced him to many acquaintances without as well as within the pale of the Society of Friends. The daughters, as they advanced in years, especially the three eldest, dressed gaily, and sang and danced—sometimes attending concerts and balls at Norwich, and sometimes pursuing their favourite amusements at Earham Hall, which had then become their father's country residence.

Elizabeth Gurney, from the age of fourteen to seventeen, was, as she herself states in her 'Diary,' somewhat sceptical, and her doubts greatly distressed her. While she was in this fluctuating state of mind, William Savery, an American Quaker, paid a religious visit to England, and, on the 4th of February 1798, preached in the Friends' meeting-house at Norwich. His discourse produced a very strong effect upon her feelings, and turned the balance of her judgment in favour of religion—a change which subsequent discourses and conversations tended strongly to confirm. She had made great progress towards becoming a 'plain Friend,' and instructed about seventy poor children in her father's house at Norwich, when Joseph Fry, who, with his brother, carried on an extensive business in London, paid a visit to Mr. Gurney at Earham Hall. While there he made an offer of marriage to Elizabeth Gurney; and on the 19th of August 1800 they were married in the Friends' meeting-house in Norwich. Joseph Fry and his family belonged to the strict section of the Quakers, and Elizabeth Fry was now prepared to adopt their usages. She resided with her husband in his house of business, Mildred's-Court, in the City of London, till the spring of 1809, when, on the death of her husband's father, she removed to Plashet House, Essex. In 1810 she became a preacher among the Friends, and ever afterwards continued to perform with great zeal the duties of her sacred office.

In the month of February 1813 she visited the prison of Newgate in London, and saw about 300 women, tried and untried, with numerous children, crowded together, without classification or employment, in rags and dirt, with no bedding, and nothing but the floor to sleep on. The season was inclement, and she supplied them with some necessary covering. After several other visits, and making much improvement in their manners as well as their condition, she in 1817 succeeded in establishing a Ladies' Committee for the reformation of the female prisoners in Newgate—the sheriffs of London and the governor of the prison granting their permission, but affording no assistance. A school and a manufactory were established in the prison; and riot, intoxication, and filth, were succeeded by order, sobriety, and neatness. The improvements which she had been the means of introducing into Newgate were gradually extended to other prisons. She had interviews with the most influential of the ministers, was examined before the House of Commons, obtained the assistance of clergymen, and visited different parts of the kingdom, including Scotland and Ireland, for the purpose of carrying out her benevolent plans. She next turned her attention to the female convicts sentenced to transportation, and introduced many improvements, tending not only to ameliorate their condition but to reform their characters. From 1833 to 1836 she paid visits to Jersey and Guernsey; and about

the same time procured the introduction of libraries in the coast-guard stations and the government packets. From 1837 to 1842 she visited the principal towns in France, Belgium, Germany, and Holland, chiefly for the purpose of extending her improvements in prison-discipline. She died on the 12th of October 1845 at Ramsgate, and was buried in the Friends' burying-ground at Barking in Essex. She bore ten children, most of whom were living at the time of her death.

(*Memoir of Elizabeth Fry, with Extracts from her Journals; edited by Two of her Daughters*, 2 vols. 8vo, London, 1847.)

* FRYXELL, ANDERS, one of the most eminent living historians of Sweden, was born on the 7th of February 1795, at the parsonage of Hesselkog in Dalsland, where his father was minister. Anders was the eldest of six children, and though he made his way to the University of Upsal, was obliged to abandon his studies for a time by want of means. In 1820 he was admitted to holy orders; and about the same time began to be known to the public as a writer in the annuals, and as the author of an opera, 'Wermelands Flickan' ('The Lass of Wermeland'), which was acted with much success at Upsal and Carlstad. In 1823 his career as an historian commenced with the first volumes of 'Berättelser ur Svenska Historien,' or 'Narratives from Swedish History,' a work originally on much the same plan as Sir Walter Scott's 'Tales of a Grandfather,' as being intended to contain only the more entertaining portions of history for the perusal of youth. Fryxell's lucid and easy style made the work so popular that he was induced, perhaps without due consideration, to enlarge the plan, and that to such an extent, that while the whole of the heathen times in Sweden are despatched in the first volume, and of the Catholic times in the second, the single reign of Charles XI., by no means one of the most distinguished kings of Sweden, occupies no less than eight volumes, from vol. xiii. to xx., which is the last we believe that has yet appeared.

In 1844 two volumes of an English translation of this work, by a lady named Schoultz, containing the first three of the original, were published under the editorship of Mary Howitt, but the work was not continued, probably from want of encouragement. The latter portion of Fryxell's work is now generally regarded as an appropriate supplement to Geijer's history of the earlier times of Sweden; but the opinions of the two historians are far from coinciding—a controversy having in fact been carried on between them respecting the estimate to be formed of the part which the aristocracy plays in Swedish history, Fryxell undertaking its defence against the heavy censure of Geijer. Some of the best and most straightforward writing which has flowed from Fryxell's pen is to be found in his pamphlets on this controversy. The reputation acquired by his history led to his being named to some honourable positions, as rector of schools at Stockholm; and in 1833 he was promoted to the dignity of professor. In the following year he applied for a government grant to prosecute his researches by a journey abroad; and failing in obtaining it, raised a private subscription for the same purpose, to which the king and the crown-prince contributed, and he was thus enabled to collect the materials for his 'Documents relating to Swedish History' ('Handlingar rörande Sveriges Historia'), 4 vols. 8vo, 1836-43. This is a very valuable collection, and the account which is prefixed of the researches which produced it from the libraries of Denmark, Germany, Poland, and Holland, contains passages of singular spirit and interest. A long list of Fryxell's works is given in Palmblad's 'Biographiskt Lexicon;' but the only one of importance that remains to be added is his Swedish grammar, a popular school-book, of which the first edition was published in 1824, and the tenth in 1852; and to which a brief history of the Swedish language and literature is appended. Fryxell is one of the Eighteen of the Swedish Academy, a member of many other learned societies, and clergyman of the parish of Sunne, in the diocese of Carlstad.

FÜGER, FRIEDRICH HEINRICH, a distinguished German painter, was born at Heilbronn in Würtemberg, in 1751. He studied first in the academy at Dresden, whence he went in 1774 to that of Vienna, where he obtained the privilege of being sent as imperial pensioner to Rome. He remained about eight years in Rome, and in 1782 visited Naples, where he was employed to paint a series of frescoes in the library of Queen Caroline at Caserta, which he satisfactorily accomplished. In 1784 Füger was recalled to Vienna, and was appointed professor in and vice-director of the academy, and subsequently director. He died at Vienna in 1818. Füger distinguished himself in fresco, oil, and miniature painting, and likewise etched several plates with skill. His style of design was however too academic; he was a venerator of Mengs and imitated his style, and therefore, as with his model, the attainment of an imaginary ideal form engrossed his attention and became the chief object in his works, at the expense of character and other great qualities. Füger painted several pictures from Roman history; some from mythology and Homer; a few from early Bible history; and a series of twenty illustrations of the 'Messiah' of Klopstock. Many of his works have been engraved; the series from Klopstock, by J. F. Leybold and others. His last picture was a large allegory of the 'Restoration of Peace,' painted in 1815, to the glory of Francis I.; it represents the gratitude of the people on the banks of the Danube, but the composition is very poor: it was engraved by G. V. Kinninger in 1821. Some of his best works have been engraved by J. P. Pichler. (Nagler, *Allgemeines Künstler-Lexicon*.)

BIOG. DIV. VOL. II.

FUGGER, a German family, originally of Augsburg, that amassed great wealth in the 15th and 16th centuries by commerce, and especially by the monopoly of the spices, which they drew from Venice, and with which they supplied Germany and other parts of the continent. The Fuggers were created counts by Charles V. in 1530, to whom they had lent large sums of money; and a story is told of their lighting a fire of cinnamon-wood with his bond or bonds for the amount, in the presence of Charles, who happened to be a visitor at their house in passing through Augsburg. They also supplied Philip II. with money, and two of their family contracted with the Spanish government for the mines of Almaden. The family became divided into several branches, one of which obtained the rank of princes of the German empire, under the title of Fugger Babenhausen, near Ulm. The family continue to this day, and their domains are partly in Bavaria and partly in Würtemberg. The Fugger family, in the 16th century, made a liberal use of their wealth, in founding charitable institutions, such as the one still called Fuggerei; in promoting learning, collecting manuscripts, and forming valuable libraries. Several members of the family were themselves men of learning; among others Ulrich Fugger, born about 1520, was for a time a confidential attendant of Pope Paul III., but afterwards returned to Germany, and printed at his own expense several valuable manuscripts of classic authors which he had collected. He engaged as his printer Henri Estienne, with a handsome salary. His family being dissatisfied with his expenditure, obtained an order from the civil courts taking away from Ulrich the administration of his property under the pretence of incapacity; but the order was ultimately rescinded, and he was restored to his rights. He died in 1584 at Heidelberg, leaving his fine library to the Elector Palatine and several legacies to poor students. Another Fugger wrote a history of Austria, published at Nürnberg in 1668. Philip Edward Fugger, born in 1546, added greatly to the library and cabinet of antiquities begun by his ancestors at Augsburg, and distinguished himself by his munificence. Otho Henry Fugger, count of Kirchberg and Weissenhorn, born in 1592, served with the Spanish army in Italy, and afterwards raised troops in Germany for the emperor Ferdinand II. during the Thirty Years' War. (Imhoff, *Notitia Imperii*; Moreri, *Dictionary*, art. 'Fugger;' *Almanach de Gotha*.)

FULGENTIUS, FABIUS CLAUDIUS GORDIANUS, Bishop of Ruspina, a town on the coast of Africa, was born about A.D. 464. His father Gordianus, who was a senator of Carthage, was obliged to leave his native city during the persecutions of the Vandals, and retired to Telepte, in the province of Byzacium, where Fulgentius passed the early years of his life. He is said to have made great progress in his studies, and to have acquired an accurate knowledge of the Greek and Latin languages. In consequence of his attainments, he was appointed at an early age to receive the public revenues of the province; but he resigned his office soon after his appointment, and retired to a monastery in the neighbourhood. After enduring many persecutions on account of his opposition to the Arian doctrines, he resolved to go into Egypt to visit the celebrated monks of that country. From this design he was dissuaded by Eulalius, bishop of Syracuse, on the ground that the monks of the East had withdrawn from the Catholic communion, and accordingly he proceeded to Rome in 500. On his return to his native country, the Catholic clergy elected him bishop of Ruspina; but he did not enjoy his dignity long, being exiled to Sardinia, together with the other Catholic bishops of that part of Africa, by Thrasimond, king of the Vandals. His learning, his austere manner of living, and his frequent controversies with the Arians, procured him the universal respect of the Catholic clergy, who considered him the greatest ornament of the African church in that age. Curiosity led Thrasimond to recall him to Carthage, where he held disputes with the king on the debated points of the Arian controversy; but as he was unable to convince the monarch, he was obliged to return to Sardinia, where he remained till 522, when the death of Thrasimond and the succession of Hildericus to the throne occasioned the recall of the Catholic bishops. Fulgentius returned to Ruspina, and resided there till the time of his death, which happened either in 529 or 533.

His works were printed at Paris, in a 4to volume, in 1684. His principal works are:—1, 'Three Books to Thrasimond, king of the Vandals, on the Arian Controversy;' 2, 'Three Books to Monimus.' The first supports the opinions of Augustin on the doctrine of predestination; the second explains the sacrifice of Christ and the passage in 1 Cor. vi. 6, "But I speak this by permission, and not of commandment;" the third contains remarks on the Arian interpretation of John i. 1, "The word was with God." 3, 'Two Books to Euthymius, on the Remission of Sins,' to show that God will pardon sins only in this life; 4, 'A Book to Donatus, on the Trinity;' 5, 'Three Books on Predestination, to John, a priest, and Venerius, a deacon;' 6, 'A Book on Faith;' 7, 'Letters on various religious Subjects,' written principally during his exile.

(Dupin, *Bibliothèque Ecclésiastique*, vol. v., p. 13-21, Eng. Trans.; *Acta Sanctorum*, vol. i., Januar. p. 32.)

FULGENTIUS, FABIUS PLACIADAS, is said to have been a bishop of Carthage, and to have lived in the 6th century. He wrote a work on 'Mythology,' in three books, addressed to a priest of the name of Catus, which was printed for the first time at Milan in 1487. There is another work of Fulgentius, entitled 'Expositio Sermonum

Antiquorum ad Chalcidicum Grammaticum, which is usually printed with the works of Nonius Marcellus. (Fabricii, *Bibliotheca Latina*, lib. ii., c. 2.)

FULGENTIUS FERRANDUS, who is frequently confounded with Fulgentius, bishop of Ruspina, lived in the beginning of the 6th century. He was a disciple of the Bishop of Ruspina, whose life he wrote. He was also the author of an 'Abridgment of the Canons,' and finished a treatise addressed to Reginus, on which his master was engaged at the time of his death.

FULLER, REV. ANDREW, born February 6, 1754, was the son of a small farmer at Wicken, in Cambridgeshire; but received his very limited education chiefly at Soham, whither his father, who was of dissenting principles, removed while he was yet young. In 1770 he became a member of the Baptist church at Soham, where, in the absence of a regular minister, he began to preach occasionally at a very early age. Early in 1775, his ministrations having proved very acceptable, he was regularly ordained pastor of the church of which he had for some time taken the charge at the request of his fellow-members; and in 1782 he accepted an invitation to remove to a Baptist church at Kettering, in Northamptonshire, over which he presided until his death, which occurred on the 7th of May 1815.

Fuller took an active part in the formation, in 1792, of the Baptist Missionary Society, of which he was secretary until his death; and he travelled extensively in England, Scotland, and Ireland to preach in behalf of this institution, the interests of which he promoted with untiring zeal. His theological works are numerous and highly prized by the nonconformists; though many of them are small, and relate to controversial subjects, often of temporary interest. His first appearance in print was in 1784, when he published a sermon on 'The Nature and Importance of Walking by Faith,' shortly after which he printed a treatise, which was written in 1781, entitled 'The Gospel worthy of all acceptance; or the duty of all sinners to believe in Jesus Christ,' a work which, from its alleged tendency to Arminianism, involved him in a warm controversy with the ultra-Calvinists. This work has been, like several of his other more important writings, repeatedly reprinted. Another important controversy was raised by the publication, in 1793, of the first edition of his 'Calvinistic and Socinian systems examined and compared, as to their moral tendency.' The anti-Socinian views promulgated in this work were attacked by Dr. Joshua Toulmin in 'The Practical Efficacy of the Unitarian Doctrine considered,' and by Mr. Kentish, to whom he replied in 1797 in his 'Socinianism Indefensible, on the ground of its moral tendency.' Fuller engaged in the Deistical controversy by the publication, in 1800, of 'The Gospel its own Witness; or the holy and divine harmony of the Christian Religion, contrasted with the immorality and absurdity of Deism.' In 1802 he collected into a small volume a series of 'Letters to Mr. Vidler, on the doctrine of Universal Salvation,' which had originally appeared in the 'Evangelical Magazine,' and in 1810 he entered upon another theological controversy by publishing his 'Strictures on Sandemanianism.' About 1808 he wrote, in answer to numerous attacks by the enemies of Christian missions, his 'Apology for the late Christian Missions in India.' Among the less controversial works of Fuller were many single sermons and religious tracts, some of which are yet in high esteem, and the following larger works:—'Memoirs of the Rev. Samuel Pearce, of Birmingham,' 1800; 'The Backslider; or an inquiry into the nature, symptoms, and effects of Religious Declension, with the means of recovery,' 1801; 'Expository Discourses on the Book of Genesis,' 2 vols., 1806; 'Dialogues, Letters, and Essays on various subjects,' 1806; a volume of 'Sermons on various subjects,' 1814; and 'Expository Discourses on the Apocalypse,' 1815, the latter being prepared for publication just before, but not issued till after his death.

Fuller's works have been repeatedly reprinted in America as well as in this country, and the college of New Jersey, about the year 1798, conferred upon him the degree of D.D., which however he declined to use. His 'Complete Works' were collected and published in several volumes in 1831, and reprinted in one very thick volume, with a new memoir by his son, Andrew Gunton Fuller, in 1845.

(*Memoirs of the Rev. Andrew Fuller*, by J. Ryland, D.D., 1816; Rev. J. W. Morris, 1826; and A. G. Fuller, 1845.)

FULLER, SARAH MARGARET, MARCHIONESS OSSOLI, was born at Cambridge-Port, Massachusetts, United States of North America, May 23, 1810. Her father, a solicitor and a member of the Congress, perceiving her early aptitude, had her so highly educated that he was accustomed to speak of her while quite a child as "knowing more Greek and Latin than half the professors," while she herself says that she had nearly forgotten her native tongue from constantly reading other languages. The consequence was that when she grew to womanhood she had an overwrought nervous system, was a somnambulist, very near-sighted, and withal what is called a strong-minded, loud voiced, excessively dogmatic, and unquestionably clever, as well as cultivated person. The sudden death of her father in September 1835, threw upon her domestic duties and obligations to which she resolutely and without affectation addressed herself. She became a teacher at Boston of Latin, French, German, and Italian, then 'Lady Superior' of a school at Providence, Rhode Island, afterwards united herself for awhile to that singular social or Fourieristic

Society the 'Brook Farm Community,' and eventually took up her pen as a means of support. She had already become well-known as a writer in the periodicals when she in 1839 published a translation of 'Eckermann's Conversations with Goethe.' Having acquired great celebrity in the literary circles of Boston, especially among the transcendentalists of that learned city, for her conversational talents as well as her critical acumen, it was proposed to turn her powers that way to account, by forming under her guidance 'conversational classes' of the ladies of Boston. The scheme, odd as it may seem, met with acceptance. Five-and-twenty "of the most agreeable and intelligent women to be found in Boston and in its neighbourhood" met at stated seasons to converse—the 'conversation' being of course mainly on the side of the learned president—on such subjects as "the genealogy of heaven and earth; the will (Jupiter); the celestial inspiration of genius, perception, and transmutation of divine law (Apollo)," and such other recondite themes as might be conveyed under the symbols of Venus, Bacchus, Cupid and Psyche, and so forth; with poetry, music, the pictorial arts, the "thought that lies at the bottom of the different dances," and other more subliminary topics.

When Mr. Emerson started his 'Dial' in 1840, Miss Fuller was one of the most prominent of his band of philosophical contributors; and she wrote for it many very clever articles on the 'Fine Arts,' &c., some of which were subsequently republished in her volume of 'Papers.' She also published at Boston in 1844, under the title of 'Summer on the Lakes,' an account of a summer tour. On the discontinuance of the 'Dial' she removed to New York, and was installed directress of the literary department of the 'New York Tribune.' Here she let her studies turn more directly on political and social philosophy; and she gave utterance to her impressions of the wrongs of her sex in 'Woman in the Nineteenth Century,' a work which excited some attention in England as well as in America. She also published here the collection of her 'Papers on Literature and Art,' already referred to: both of these works were we believe reprinted in London.

In the spring of 1846 she put in execution a cherished scheme of a prolonged European tour. She first visited England, where she stayed some time, and obtained introductions to many of the literary notabilities, whom she describes and criticises in her letters with a most amusing air of superiority. In Paris she also remained for some time and formed the acquaintance of Madame Dudevant, &c. But Italy was the place she had most desired to visit, and thither she next proceeded—little dreaming to what a strange conclusion all her theories of woman's rights and claims and missions would there be brought. For a brief space she revelled in the enjoyment of the scenery, the climate, and the boundless treasures of art in that sunny region; and it must be added that a portion of her time was occupied in rendering herself conspicuous by her open and resolute, though somewhat imprudent avowal of extreme democratic opinions, and intercourse with persons obnoxious to the authorities on account of their suspected liberalism. But at length she became involved in an affair of a very different though not less exciting nature. She met by accident at vespers, in St. Peter's, Rome, while separated from her friends by the crowd, a young Italian gentleman; he behaved with a courtesy that charmed her; an intimacy ensued, and, though he was many years her junior, so utterly uneducated that he had scarce ever looked into a book, and without any kind of intellectual pretensions, the strong-minded worshipper of intellect with a very little wooing gave him her hand. But the young Marquis Ossoli, though of a noble family, had a very small patrimony, and that was in the hands of trustees. Moreover his family were devoted Roman Catholics, and his elder brothers held high appointments under the papal government; they would of course be bitterly incensed at his marrying a lady not of that faith, and especially one who was an avowed liberal. He therefore urged that the marriage should be strictly concealed: and to this she submitted. They were married in December 1847, and Madame Ossoli remained in Rome, ostensibly living alone as plain Margaret Fuller; indeed it was not till more than a year after the birth of a son that even her own mother was informed of the marriage. The sudden ascendancy of liberalism in Rome however altered matters. Miss Fuller had in London met Mazzini, and undertaken, as it would seem, to bear communications from him to various Italian liberals; and she had converted her husband to her own political creed. When the revolution broke out her husband threw himself heartily into the movement; and she shrank from none of the duties which her position and her opinions seemed to have devolved upon her. During the siege of Rome she was occupied as a nurse, having charge of one of the hospitals opened by the Roman Commission for the succour of the wounded, and acted with a noble disregard of toil or danger, and with much judgment as well as the greatest kindness in her self-imposed task. The fall of the republic compelled her to leave Rome; and with her husband and her child she, after staying the winter at Florence, embarked at Leghorn in May 1850, on board the *Elizabeth*, for America. From the first the voyage was unpropitious; the captain died soon after the ship sailed; the weather was throughout stormy; and though the vessel reached the American coast, it was only to be wrecked there, having struck on Fire Island Beach, Long Island,

July 16, 1850. A few of the passengers and crew were saved, but Margaret Fuller, her husband, and child were among the drowned. The body of her child came ashore, but her own tomb was the ocean.

The writings of Margaret Fuller will have no permanent value in themselves, either for their literary merits, their social opinions, or their estimates of character, of art, or of literature. But they will retain a certain value, in connection with the history of their author, as illustrative of a peculiar phase of society in America during the second quarter of the 19th century. Margaret Fuller herself was undoubtedly a woman of great ability as well as of considerable attainments, but she had thoroughly studied not a single subject, and her writings are all disfigured by dogmatism, assumption, and self-reference. In them you often come upon a striking and apparently original thought, but if the thought be dwelt on for a moment, it is recognised as owing its uncommonness mainly to peculiarity of expression: and sometimes these peculiarities degenerate into grotesqueness. Had her life been spared however there can be little doubt that what was strange, and almost repulsive in her earlier works, would have disappeared, and the better and lovelier part of her character and intellect have revealed itself. The severe mental discipline she had undergone in Rome had, as she said in one of more of her letters, subdued her pride; and with humility came in all the gentler virtues and intellectual graces. Nothing could be more noble and beautiful than her conduct as a woman, a wife, and a mother under her marriage trials, and during and after the siege of Rome; and the letters which she wrote then are more graceful and eloquent than perhaps anything else which has fallen from her pen. She wrote an account of the Roman revolution, the progress and suppression of which she had watched so eagerly, but the manuscript perished with her.

(*Memoirs of Margaret Fuller Ossoli*, compiled by her friends J. F. Clarke, R. W. Emerson, and W. H. Channing, 2 vols. 8vo, Boston, 1852, and 3 vols. 8vo, London, 1852.)

FULLER, THOMAS, was the son of the Rev. Thomas Fuller, rector of St. Peter's Aldwinckle, in Northamptonshire, where he was born in June 1608. He was educated under his father, and was sent in his thirteenth year to Queen's College, Cambridge, of which his uncle Davenant bishop of Salisbury was president. He became B.A. in 1625, and M.A. in 1628, but afterwards removed to Sidney Sussex College, where he obtained a fellowship in 1631, and nearly at the same time the prebend of Netherby, in the church of Salisbury, and the living of St. Benet's, Cambridge. In this year also he issued his first publication, a quaint poem, now little known, entitled 'David's Hainous Sin, Heartie Repentance, Heavie Punishment,' in 12mo. He was soon after represented by his uncle to the rectory of Broad Windsor, in Dorsetshire, where he remained about seven years; when he removed to London, and distinguished himself so much in the pulpits there, that he was invited by the master and brethren of the Savoy to be their lecturer. In 1639 he published his 'History of the Holy War:' it was printed at Cambridge, in folio, and by his striking originality became so popular that a third edition appeared in 1647. On April 13, 1640, a parliament was called, and a convocation also began at Westminster, in Henry VIIIth's chapel, having licence granted to make new canons for the better government of the church: of this convocation he was a member, and has detailed its proceedings in his 'Church History.' During the commencement of the Rebellion, and when the king left London, in 1641, to raise an army, Fuller continued at the Savoy, to the great satisfaction of his congregation and the neighbouring nobility and gentry, labouring all the while in private and in public to soften the angry feelings existing between the two great parties into which society was rapidly dividing. On the anniversary of the accession of Charles, March 27, 1643, Fuller preached at Westminster Abbey on this text, 2 Sam. xix. 30, "Yea, let him take all, so that my lord the king return in peace," in which he earnestly urged the duty of mutual concession with a view to peace. But as he had taken occasion in his discourse to laud the piety and personal character of the king, and to expatiate on the liberality of the royal offers, his sermon on which being printed, gave great offence to those who were engaged in the opposition, and exposed the preacher to a good deal of danger. This offence was increased by a sermon he preached on the Fast day, July 27; and soon after refusing to take an oath to the parliament, unless with such reserves as they would not admit, Fuller withdrew from London in the autumn of 1653, and joined the king at Oxford. Charles, having heard of his extraordinary abilities in the pulpit, was desirous of knowing them personally, and accordingly Fuller preached before him at St. Mary's church. But his entreaties to moderation as a means to a reconciliation were as little acceptable in Oxford as they had been in London. In London he had been censured as too hot a royalist; and now, at Oxford, he was pronounced little better than a puritan. During his stay here, his residence was in Lincoln College, but he was not long after sequestered, and lost all his books and manuscripts. This loss, the heaviest he could sustain, was made up partly by Henry Lord Beauchamp, and partly by Lionel Cranfield, earl of Middlesex, who gave him the remains of his father's library. Fuller found matters at Oxford so little to his liking, that he left it within about four months from entering it; but in order that he might not lie under the suspicion of want of zeal or courage in the royal cause, he determined to join the army, and there-

fore, being well recommended, was received by Sir Ralph Hopton in the quality of chaplain. For this employment he was at liberty, being deprived of all other preferment. Though he attended the army from place to place, and constantly exercised his duty as chaplain, he yet found proper intervals for his favourite studies, which he employed chiefly in making historical collections, and especially in gathering materials for his 'Worthies of England,' which he did, not only by an extensive correspondence, but by personal inquiries in every place which the army had occasion to pass through.

After the battle at Cheriton Down, March 29, 1644, Lord Hopton drew on his army to Basing House, and Fuller, being left there by him, animated the garrison to so vigorous a defence of that place, that Sir William Waller was obliged to raise the siege with considerable loss. But the war coming to an end, and part of the king's army being driven into Cornwall under Lord Hopton, Fuller, with the permission of that nobleman, took refuge at Exeter, where he resumed his studies, and preached constantly to the citizens. During his residence at Exeter he was appointed chaplain to the infant princess, Henrietta Maria, who was born at Exeter in June 1643. He continued his attendance on the princess till the surrender of Exeter to the parliament, in April 1646. He is said to have written or finished his 'Good Thoughts in Bad Times' at Exeter, where the book was published in 1645, 16mo: and also, 'Good Thoughts in Worse Times,' published in 1647. On the garrison being forced to surrender, he, being "weak in health and dejected in spirits," retired for awhile to the residence of the Countess of Rutland, at Boughton, near Northampton; where, by way of medicine for his mental weakness, he wrote his 'Cause and Cure of a Wounded Conscience.' At the end of a few months he returned to London, where, though he found his lectureship at the Savoy filled by another, he preached wherever his services were permitted. After a time he appears to have delivered regularly a week-day lecture at St. Clement's, near Lombard-street, and at St. Bride's, Fleet-street. In 1647 he published, in 4to, 'a Sermon of Assurance, fourteen years ago preached at Cambridge, since in other places, now by the importunity of his friends exposed to public view.' He dedicated it to Sir John Danvers, who had been a royalist, was then an Oliverian, and next year one of the king's judges; and in the dedication he says, that "it had been the pleasure of the present authority to make him mute, forbidding him, till further order, the exercise of his public preaching." Notwithstanding his being thus silenced, he was, about 1648, presented to the rectory of Waltham Abbey, in Essex, by the Earl of Carlisle, and there, after having undergone the customary ordeal of the 'Triers,' he was permitted to preach undisturbed. In 1648 he published his 'Holy State,' folio, Cambr. His 'Pisgah-sight of Palestine and the Confines thereof, with the History of the Old and New Testament, acted thereon,' was published, fol. Lond. 1650, and reprinted in 1682. At this period he was still employed upon his 'Worthies.' In 1651 he published his 'Abel Redivivus, or the Dead yet Speaking; the Lives and Deaths of the Modern Divines,' Lond. 4to. In the two or three following years he printed several sermons and tracts upon religious subjects: 'The Infant's Advocate,' 8vo, Lond. 1653; 'Perfection and Peace, a Sermon,' 4to, Lond. 1653; 'A Comment on Ruth, with two Sermons,' 8vo, Lond. 1654; 'A Triple Reconciler,' 8vo, Lond. 1654. About this last year he took as a second wife a sister of the Viscount Baltinglass. In 1655, notwithstanding Cromwell's prohibition of all persons from preaching or teaching school who had been adherents to the late king, he continued preaching and exerting his charitable disposition towards those ministers who were ejected, as well as towards others. In 1655 he published in folio 'The Church History of Britain, from the birth of Jesus Christ until the year MDCXLVIII,' to which he subjoined 'The History of the University of Cambridge since the Conquest,' and 'The History of Waltham Abbey, in Essex, founded by King Harold.' The Church History was animadverted upon by Dr. Peter Heylyn in his 'Examen Historicum,' to which Fuller replied in his 'Appeal of Injured Innocence,' fol. Lond. 1659. It is said that Lord Berkeley, in 1658 or 1659, took him over to the Hague, and introduced him to Charles II. It is certain however that a short time before the Restoration he was re-admitted to his lecture in the Savoy, and on that event restored to his prebend of Salisbury. He was chosen chaplain extraordinary to the king; and created D.D., at Cambridge, by a mandamus dated August 2, 1660. Upon his return from Salisbury, in August 1661, he was attacked by a severe fever, then very prevalent, and known as "the new disease," of which he died on the 16th of that month. His funeral was attended by at least two hundred of his brethren of the ministry. He was buried in his church of Cranford, on the north wall of the chancel of which his monument is still remaining. His 'History of the Worthies of England,' was not published till after his death, fol. Lond. 1662: it has been more than once reprinted; the best modern edition is that issued from the Oxford University press in 6 vols. 8vo, 1845, under the editorial care of the Rev. J. S. Brewer.

Besides the works already mentioned, Fuller was the author of several others of a smaller kind. 'Joseph's Parti-coloured Coat,' a comment on Chap. xi. of the First Epistle of St. Paul to the Corinthians, with eight sermons, 4to, Lond. 1640. 'Andronicus, or the Unfortunate Politician,' 12mo, Lond. 1646. 'A Comment on the

eleven first verses of the fourth chapter of St. Matthew's Gospel, concerning Christ's Temptations, Lond. 1652; 'Ephemeris Parliamentaria,' fol. 1654, and re-issued with new titles in 1658 and 1660. 'Mist Contemplations in Better Times,' 12mo, Lond. 1660. 'Ornithologie: or the Speech of Birds; also the speech of Flowers, partly moral, partly mystical,' 12mo, 1660; besides a 'Collection of Sermons,' 1657; and various single sermons, a 'Panegyrick to His Majesty on his Happy Return,' 4to, 1660, &c. In 1651 he published Dr. Holdsworth's 'Valley of Vision,' with a preface. A specimen of his Latin composition, in what is called 'An Echo,' occurs in the first book of 'Ayres and Dialogues, for one, two, and three Voices,' by Henry Lawes, fol. Lond. 1653. Fuller was a man of great originality; of wit so exuberant as to colour every page of his writings, and yet thoroughly genial, gentle, and natural; and with a lively imagination he always displays great shrewdness, discrimination, comprehensiveness of thought, clearness of vision, and freedom from prejudice. His personal character appears to have been in every respect admirable.

(*Life of Dr. Thomas Fuller*, 12mo, Lond. 1661; *Biogr. Britan.*, vol. iii. 2049-69; Russell, *Memorials of Thomas Fuller*; and *Life of Thomas Fuller in Knight's Cabinet Portrait Gallery*, vol. vii.)

FULTON, ROBERT, distinguished as having been the first to establish steam-navigation on the American seas and rivers, was born in 1765 in Little Britain, Pennsylvania. His parents were emigrants from Ireland. He received a common English education at a village school. Besides a fondness for mechanical pursuits, he early displayed a taste for drawing, and in his eighteenth year went to Philadelphia, and began to paint portraits and landscapes as a means of subsistence. In November 1786 he embarked for England, and on his arrival in London was received as an inmate in the house of West, the historical painter, with whom he continued to reside for some years, and who also gave him instructions in his profession.

After leaving West, painting was for some time his chief employment; but with Fulton the fine arts were destined to give place to the mechanical. He spent about two years in Devonshire, where he became acquainted with the Duke of Bridgewater, and projects for the improvement of canals then began to occupy the chief share of his attention. In 1794 he took out a patent for an inclined plane, which was intended to set aside the use of locks; he invented a machine to facilitate excavation, and wrote a work on canals, in which he first styled himself a civil engineer. He also invented a mill for sawing marble, and took out patents for spinning flax and making rope.

Fulton seems however to have had little success; and at the latter end of 1796 went to Paris, on the invitation of Joel Barlow, then resident minister from the United States, in whose house he resided during seven years. While at Paris two projects appear to have occupied a large portion of his time and attention: one, a carcass or box filled with combustibles, which was to be propelled under water, and made to explode beneath the bottom of a vessel; the other, a submarine boat, to be used for a similar destructive purpose. The first was a failure; but of his submarine boat he made many trials and exhibitions, some of them at the expense of the French government, with occasional failures and partial success, on the Seine, at Havre, and at Rouen. But for all practical purposes this was as much a failure as the other. He appears however to have clung to it with great perseverance, and not long before his death exhibited the power of his 'torpedo,' as he called it, by blowing up an old vessel in the neighbourhood of New York.

But while at Paris Fulton had other and better pursuits. He made himself acquainted with the higher branches of science, and with the modern European languages; he projected the first panorama exhibited at Paris, and in conjunction with Mr. R. Livingston, the American ambassador, began to make experiments on the Seine with small steam-boats: a larger one was built, which broke asunder, but a second, completed in 1803, was successful.

Soon after this time he was invited to England by the English ministry, at the suggestion of Earl Stanhope, with whom Fulton had become acquainted about the time of his introduction to the Duke of Bridgewater. The object of the English ministry appears to have been to employ him in the construction of his submarine implements of war. After some trials on the Thames the negotiation failed, and Fulton resolved to embark for America.

In 1806 Fulton arrived at New York, and soon after, with funds supplied by Mr. Livingston, commenced the construction of a steam-vessel of considerable size, which began to navigate the Hudson in 1807. He afterwards built others of large dimensions, one of them a steam war-frigate, which bore his name. His reputation became established, and his fortune was rapidly increasing, when his patent for steam-vessels, which he had taken out in conjunction with Mr. Livingston, was disputed, and his opponents were in a considerable degree successful. His constitution had been impaired by his numerous labours, and a severe cold which he caught by incautious exposure in giving directions to his workmen, together with the anxiety and fretfulness occasioned by the lawsuits about his patent rights, brought his life to a premature termination on the 24th of February 1815, in his forty-ninth year. His death occasioned extraordinary demonstrations of national mourning in the United States.

FUSELL, HENRY, was the second son of John Caspar Fuesli, a portrait and landscape painter, and author of 'Lives of the Helvetic

Painters.' He was born at Zürich in Switzerland, 7th February, 1741. The elder Fuesli gave his son a classical education, and brought him up for the church. He accordingly entered the Caroline College at Zürich, and having taken his degree of Master of Arts, entered into holy orders in 1761; but having written a pamphlet, in conjunction with Lavater, in which the misconduct of a magistrate was exposed, the friends of the two young men deemed it prudent that they should travel for awhile. After travelling in Germany he came to England, partly it appears as an agent for the purpose of establishing some regular plan of literary communication between that country and his native place. Sir Andrew Mitchell, the British minister at the court of Prussia, furnished him with introductions; and he supported himself for some time by translating from German, French, and Italian into English, and from English into German. The 'Letters' of Lady M. W. Montagu were among the works he translated into German. In 1765 he published a translation of Winckelmann's 'Reflections on the Painting and Sculpture of the Ancients.' In the following year he set out as travelling tutor to Lord Chewton, the eldest son of Earl Waldegrave; but he soon threw up his charge in displeasure. About this time he became acquainted with Sir Joshua Reynolds, to whom he showed some of his drawings. Reynolds recommended him to devote himself entirely to painting, and he followed the advice.

In 1770 he went to Italy, at which time he altered his name to Fuseli, to suit the Italian pronunciation, and this form he retained after his return to England. In 1778 he visited Zürich on his way back to England. On his return he was engaged by Alderman Boydell, with other artists, to paint pictures for the Alderman's Shakspeare Gallery. About the same period he edited the English edition of Lavater's work on physiognomy, and assisted Cowper in his translation of Homer, with remarks and corrections. In 1788 he married Miss Sophia Rawlins of Bath Eaton, and subsequently was elected an Associate of the Royal Academy. In 1790 he was elected Royal Academician. In 1799 he completed a number of pictures, designed from the works of Milton, to form a Milton Gallery, the idea of which was suggested by the Shakspeare Gallery; but he realised nothing by their exhibition. In the same year he was elected professor of painting to the Royal Academy, and in 1803 keeper. His edition of Pilkington's 'Lives of the Painters' was brought out in 1805. Canova, upon his visit to England, was much struck with Fuseli's works; and on the sculptor's return to Rome, at his recommendation Fuseli was elected a member of the first class in the Academy of St. Luke's. Fuseli died April 15, 1825, and was buried in the crypt of St. Paul's cathedral.

Fuseli had great facility in learning languages. He said that he could think and write with equal ease in French, Italian, and English, but with most power in German. His English writings are in a style not purely idiomatic, but they are full of nerve and originality of expression. His lectures contain (if we except some of his remarks upon contemporaries, which were sometimes all but unavoidably modified by personal feelings) some of the best criticism on the fine arts which had then appeared in the language. Though singularly abrupt and irritable in temper, he made and retained many friendships which were only broken by death. Lavater, Bonnycastle, and Johnson (the publisher), were among the oldest of his friends, and he survived them all. Many curious anecdotes are told of the freedom and quaintness with which he passed his strictures on all persons in matters of art, literature, or manners.

Fuseli made the works of Michel Angelo his chief study. He also moulded his style much upon the model of the colossal statues on Monte Cavallo at Rome. His colouring is low in tone, and overspread with a sickly, greenish, leaden, or yellowish hue; his hand was hasty, and not skilful. He would sometimes work with his colours dry in the powder, rubbing them up with his brush. Probably from a deficiency in his early study, his drawing was not so correct as his ambition was daring. His anatomy sometimes resembles the mechanical and coarse ostentation of an artificial myotomical model rather than the free, varying, and blended forms of nature. The proportions are frequently exaggerated, and the action violent and intemperate. In his desire to display the naked figure he often sacrifices his better knowledge, and violates all rules of costume; and there is sometimes much that is extravagant and fantastical in his design. His figures rest about the commonest occupations, straining every feature, finger, and toe, with superfluous energy. On the other hand, there is always life and action in his figures, some even going forward in the design. In dreamy or terrible subjects he is often grand and impressive. Fuseli loved his art with a genuine affection, and the bold and original thoughts of his vigorous if not exalted mind were impressed upon the canvass without misgiving. He only wanted a better training of his hand, and a more temperate habit of thinking, to have made a great painter. As it is, he has helped to vindicate the supremacy of design (including invention) and expression over the inferior parts of the art, and has done much to advance a better taste in this country.

(Knowles, *Life of Fuseli*, prefixed to Fuseli's works, 3 vols. 8vo, 1831.)

FUST, or FAUST, JOHN, an opulent citizen of Mainz, a goldsmith by trade, whose name appears as one of the inventors of the art of printing, in the manner in which that art is effected by moveable metal types. Gutenberg and Schöffer were the two others. Gutenberg appears to have been the inventor of separate cast types.

[GUTENBERG.] Schöffer, by inventing the punch, is supposed to have given completion to the discovery. Fust, like all the goldsmiths of his time, was no doubt an engraver also; and might in that capacity have been of use in forwarding the invention. It is not certain however that Fust did more than supply money to Gutenberg, who had been making experiments with types at Strasbourg, before he removed to Mainz in 1444-45. In 1450 the partnership commenced between Fust and Gutenberg; it lasted only till 1455, when Fust sued Gutenberg for money lent. The sum really advanced appears to have been 1600 florins, swollen by charges for interest and expenses to 2020 florins. The judges decided that a certain sum was due from Gutenberg [GUTENBERG], and in consequence the whole of Gutenberg's printing apparatus fell into Fust's hands, who ultimately, with the assistance of Peter Schöffer, made the invention useful to the world. The earliest production of the press of Gutenberg and Fust is supposed to be an indulgence of Pope Nicolas V. to Paulin Zappe, the ambassador of John, king of Cyprus, issued August 12, 1451, of which four copies are known, printed on vellum, and dated 1454, though in all the copies but one the date has been altered with a pen; a second was 'Eyn manung der Cristenheit widder die durken' ('An Appeal to Christendom against the Turks'), of which the date is plausibly supposed to be 1454. The 'Latin Bible,' in folio, commonly called the 'Mazarine Bible,' was published in 1456, and as the dissolution of partnership did not take place till November 1455, a great part of it must have been printed before that event.

The books with dates which bear the joint names of Fust and Schöffer are:—1, 'The Latin Psalter' of 1457, in large folio; the type of the size used in the great service books of the Romish Church. At the end is this subscription—

"Ad inuentione artificiosa imprimendi ac caracterizandi absque calami ulla exaratione sic effigiatus. Et ad eusebiam dei industrie est consummatus per Johannem Fust Ciuem Maguntinum. Et Petrum Schoffer de Gernsheim. Anno dni Millesimo CCCC.LVII. In Vigilia Assumptionis."

2, 'The Psalter' of 1459; with some variations from the preceding, but in the same size and letter. 3, 'The Rationale divinorum Officiorum' of Durand, 1459, fol. maj.; the first specimen of the smaller type of Fust and Schöffer. 4, 'The Clementine Constitu-

tions,' 1460, fol. maj. 5, 'The Latin Vulgate Bible,' 2 vols., 1462, fol. maj. Copies of this Bible are oftener found printed upon vellum than on paper, but both are rare. 6, 'The German Bible,' fol. maj. [Known to have been printed in 1462, or thereabout.] Reprinted in 1465. 7, 'Bulla Papæ Pii II.,' Germ., 1463, fol. maj. 8, 'Liber sextus Decretalium Bonifacii VIII.,' Pont. Max., 1465, fol. maj.: a second, or at least a varying impression of this work appeared in the same year. 9, 'Cicero's Offices and Paradoxa,' 1465, sm. fol.: the first edition of Cicero with a date. 10, 'Cicero's Offices and Paradoxa,' 1466, sm. fol. Copies of this edition are more common upon vellum than on paper: that of 1465 is very rare upon vellum. 11, 'Grammatica rhythmica,' 1466, fol. min. It consists of eleven leaves in the smallest fount of type of these printers, and is of extreme rarity; two or three copies only are known.

The following works without date, from the close resemblance of their typography, are assigned without scruple by our best bibliographers to the press of Fust and Schöffer:—1, 'Bulla Crucata sanctissimi Domini nostri Papæ contra Turcos,' fol., in six printed leaves. It has no place or name. The type is like the Durand. 2, 'Laus Virginis,' folio, nine leaves. The device of the shields in red, at the end, seen in so many of these printers' works, decidedly justifies its being placed as the production of Fust and Schöffer's press. 3, 'S. Aurelii Augustini de Arte prædicandi Tractatus,' folio: supposed to have been printed about 1466. It consists of twenty-two leaves. 4, 'Ælius Donatus de Octo partibus Orationis,' 4to; the type of the smaller size, resembling the Latin Bible of 1462 and the Cicero of 1465. The conclusions however drawn from a similarity of type must be very doubtful, as, when punches were invented and types cast, the appearance might be the same, whatever the date and whoever the printer.

With an exception or two, the whole of Fust and Schöffer's productions are in the collection at the British Museum.

Fust, whose name appears with Schöffer's for the last time in 1466, is supposed to have died in that, or at latest in the next year, of the plague, at Paris. Schöffer continued to print in his own name for a long time.

(Panzer, *Annal. Typogr.*, vol. ii, p. 111-17; *Biblioth. Spenceriana*, passim.; *Biogr. Universelle*, tom. xvi., p. 205; Peignot, *Variétés, Notices, et Raretés Bibliographiques*, 8vo, Par., 1822, p. 78.)

END OF VOLUME II.

THE following is a list of the names of persons who have died since the publication of the 'Penny Cyclopædia,' and of "those living names" which, in accordance with the announcement in the Prospectus, are included in the second volume of the Biographical Division of the 'English Cyclopædia.' The asterisk is prefixed to living names:—

- *Caballero, Fermin
- *Cabet, Etienne
- *Calvera, Don Ramon
- *Caban, Samuel
- *Cailaud, Frederic
- *Cajman, John Caldwell
